- When you print using the Invert option, images do not print inverted correctly.

Publish It!

- Use a pre-LaserWriter 8 version of the driver, or contact the publisher of the application program.

QuarkXPress 3.3.1

- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- Some imported JPEG files may not print correctly.

RagTime 3.2

- You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

- Use ReadySetGo! version 6.0 or later with the LaserWriter 8 printer driver; earlier versions will not work.
- With the Unlimited Downloadable Fonts option selected, you may not be able to print complex documents.
- Documents that use pen patterns will print patterns as solid gray.

Studio/8 & Studio/32

- When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.

WordPerfect 3.0

- When you select the Unlimited Downloadable Fonts option and print rotated text in Watermark, the entire document rotates when printed.
- When you select the Unlimited Downloadable Fonts option, Watermark option, and Color/Grayscale option, black text prints as gray.

How to Get Updated Printer Software

=====

The latest LaserWriter 8 software is posted to the following commercial online services and Internet sites.

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

System 7.5: Not Enough Memory to Load Extensions Message (7/95)

Revised: 7/27/95
Security: Everyone

System 7.5: Not Enough Memory to Load Extensions Message (7/95)

=====

Article Created: 29 June 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

I have a Quadra 800 with System 7.5 (no update) and Apple Menu Options 1.0.2. When I restart my Macintosh, the extensions load but a window comes up with the following message:

"There is not enough memory to load all of your extensions...To make more memory available, remove one or more extensions from the Extensions folder or reduce the size of the RAM disk and/or Disk Cache in the Memory Control panel then restart your Macintosh."

DISCUSSION -----

The first step in troubleshooting this problem is to make sure you have not created a RAM disk. Check your memory control panel and make sure that RAM Disk is set to Off, and restart.

The next step is to make sure you are not having a conflict with any third party extensions. Use the following steps to troubleshoot your third party extensions in System 7.5:

Step 1

Under the Apple menu, choose Control Panels.

Step 2

Double click the Extensions Manager control panel.

Step 3

Pull down the Sets menu in the upper right corner of the Extensions Manager and choose System 7.5 Only.

Step 4

Under Special, choose Restart.

If the same error occurs, then it is not a result of a third party extension conflict. Further, if you restart your Macintosh computer while holding down the shift key to turn all the extensions off and the error message does not come up, then you may be having a problem with an Apple extension.

Apple Menu Options 1.0.2 may generate this error when its preference file becomes corrupted. You can create a new Preference file by dragging the "Apple Menu Options Prefs" file from the Preferences folder in your System Folder to the Trash and restarting your Macintosh.

Macintosh: Starting from Floppy or CD-ROM disc (6/95)

Revised: 2/17/97
Security: Everyone

Macintosh: Starting from Floppy or CD-ROM disc (6/95)

=====

Article Created: 29 June 1995

TOPIC -----

This article describes all the ways you can start a Macintosh computer from either a Utilities disk, Disk Tools disk, Install Me First CD, Apple Macintosh CD, Power Macintosh CD, Macintosh Performa CD, or System 7.5 Upgrade CD.

DISCUSSION -----

You may occasionally need to start your Macintosh from a device other than your hard drive in order to correctly use software such as Disk First Aid, Apple HD SC Setup, other utilities, or to troubleshoot an issue with other disk volumes.

Macintosh system software normally resides on the hard disk. System software, however, may also be installed on a floppy disk or on a CD-ROM disc, and it may be desirable to start the system using that software in order to investigate issues relating to the system software on the hard disk, or the hard disk itself.

If you have a Disk Tools disk or Utilities disk:

Step 1

Under Special, choose Shut Down.

Step 2

Insert the Disk Tools disk or Utilities disk.

Step 3

Turn on the computer.

The computer will take longer than normal to start up. When it is finished

starting up, the Trash icon will appear on the screen.

The Disk Tools or Utilities disk icon will appear in the upper right hand corner of the screen. If your hard disk or Macintosh HD icon is visible, it should be right below the Disk Tools disk or Utilities disk icon.

Note: To eject the disk, choose "Restart" from your Special menu.

If you are trying to start up with the System 7.5 Personal Upgrade CD:

Use the Disk Tools disk in the pouch which accompanies the System 7.5 CD to start the computer as described above. The Disk Tools disk that comes with this CD disc has the Apple CD-ROM extension, which will allow it to mount the System 7.5 CD disc once the CD is inserted.

Note: If you have an external CD-ROM drive, make sure it is turned on prior to starting the computer with the Disk Tools disk.

If you have a Power Macintosh system with an Apple Macintosh CD or Power Macintosh CD, or if you have a Macintosh Performa 6100 or 5200 series computer with a Macintosh Performa CD:

Step 1

Insert the CD-ROM.

Step 2

Under Special, choose Shut Down.

Step 3

Hold down the "c" key (lower-case C; if you have a keyboard with a physical latch for the Caps Lock key, make sure the Caps Lock key is in the "up" position).

Step 4

Startup your computer.

Step 5

Hold down the "c" key until you see Welcome to Macintosh.

The computer will take longer than normal to start up. When it is finished starting up, the Trash icon will appear on the screen.

The Apple Macintosh CD, Power Macintosh CD, or Macintosh Performa CD icon will appear in the upper right hand corner of the screen. If your hard disk or Macintosh HD icon is visible, it should be right below the CD icon.

Note:

To eject the CD-ROM disc, choose "Restart" from your Special menu. Immediately after you hear the startup chime, press the eject button on the front of the computer. The CD-ROM caddy will pop out or CD-ROM tray will open.

If the computer, for any reason, fails to start from your CD-ROM drive, follow the instructions described below.

If you have an Install Me First CD, or an Apple Macintosh CD on a non-Power Macintosh system, or a Macintosh Performa CD for a Performa 500 or 630 series computer:

Step 1

Insert the CD-ROM.

Step 2

Under Special, choose Shut Down.

Step 3

Hold down the Option, Command (Apple), Shift, and Delete keys. If you have a keyboard with a physical latch for the Caps Lock key, make sure the Caps Lock key is in the "up" position.

Step 4

Startup your computer.

Step 4

Continue holding down the Option, Command, Shift, and Delete keys until you see Welcome to Macintosh.

The computer will take longer than normal to start up. When it is finished starting up, the Trash icon will appear on the screen.

On the top right hand side of the screen, you should see the Apple Macintosh CD, Install Me First CD icon, or Macintosh Performa CD icon. If your hard disk or Macintosh HD icon is visible, it should be right below the CD icon.

Note:

To eject the CD-ROM disc, choose "Restart" from your Special menu. Immediately after you hear the startup chime, press the eject button on the front of the computer. The CD-ROM caddy will pop out or CD-ROM tray will open.

If you are using any type of startup CD, and can start your computer normally:

Step 1

Insert your startup CD disc.

Step 2

Choose Control Panels from your Apple menu.

Step 3

Open the Startup Disk control panel.

Step 4

Click once on the CD icon to highlight it.

Step 5

Close the Startup Disk control panel.

Step 6

Under special, choose Restart. If the CD disc pops out, push it back in.

Note:

To eject the CD-ROM disc, choose "Restart" from your Special menu. Immediately after you hear the startup gong, depress the eject button on the front of the computer. The CD-ROM caddy will pop out or CD-ROM tray will open.

Power Macintosh with CD: How to Make Emergency Disk (6/95)

Revised: 6/30/95
Security: Everyone

Power Macintosh with CD: How to Make Emergency Disk (6/95)

Article Created: 29 June 1995

TOPIC -----

I have a Power Macintosh computer which shipped with a CD-ROM drive. I have purchased a third-party disk management utility which states I should use a "Disk Tools" disk in order to create an emergency disk. I did not receive one with my computer. How can I create an emergency disk?

DISCUSSION -----

Apple currently ships a CD-ROM drive as part of many Power Macintosh systems. If you received a Power Macintosh CD or an Apple Macintosh CD as part of your bundle, that effectively replaces a conventional Disk Tools floppy disk. In addition to containing conventional disk diagnostic software, the Power Macintosh CD also contains a complete back-up of your system software.

The Apple Macintosh CD and Power Macintosh CD also have a folder called Disk Images. You can use the files within this folder to create a Disk Tools disk appropriate for your computer. However, depending upon the version of system software you have, it may not be appropriate for use with your third-party utility. The Disk Tools disk is a startup disk which was designed to provide a framework from which the Apple applications Apple HD SC Setup and Disk First Aid could be run.

You can get instructions on how to use Disk Copy, the program that manipulates disk images, by consulting the Tech Info Library article entitled "Apple Disk Copy 4.2 Instructions".

In many cases, you can still use your Apple Macintosh CD or Power Macintosh CD as a start-up disk, then insert a floppy disk containing whatever disk-based diagnostic software you are trying to run.

Follow these steps to start your Power Macintosh computer from your startup CD:

With your Macintosh turned on:

Step 1

Insert the CD-ROM disc.

Step 2

Under the Special menu, choose Restart.

Step 3

Hold down the "c" (lower-case C) key until you see Welcome to Macintosh.

Follow these steps to start any CD-ROM drive equipped Macintosh computer from your startup CD:

With your Macintosh turned on:

Step 1

Insert the CD-ROM disc.

Step 2

Under the Apple menu, choose Control Panels.

Step 3

Double click on the Startup Disk control panel.

Step 4

In the Startup Disk control panel, click on the CD-ROM icon to highlight it.

Step 5

Close the Startup Disk control panel and restart your Macintosh.

-or-

Step 1

Insert the CD-ROM disc.

Step 2

Under the Special menu, choose Restart.

Step 3

Immediately hold down the Shift-Option-Command(Apple)-Delete keys.

Step 4

Continue holding these four keys until you see the Welcome to Macintosh screen.

The first device mounted on your desktop beneath the Application menu in the upper right corner of your screen is the device that your computer used to startup.

If the software you are using does not support the use of a startup CD, or does not contain instructions on how to use the startup CD with that product, or does not work with the Disk Tools disk for your version of system software, you should contact the manufacturer of the software for further assistance.

HyperCard: Printing White Text on Black in Quickdraw GX (8/95)

Revised: 8/28/95
Security: Everyone

HyperCard: Printing White Text on Black in Quickdraw GX (8/95)

=====

Article Created: 29 June 1995
Article Reviewed/Updated: 28 August 1995

TOPIC -----

I am printing a HyperCard card with white text on a black background. The printed card comes out all black with no text shown. If I select some other fill pattern, the outline of the text shows but the fill pattern is inside the character outlines.

This only happens when I use the LaserWriter GX driver.

DISCUSSION -----

This is the correct behavior when using a QuickDraw GX driver. HyperCard is using black & white QuickDraw, which does not let the background pattern show through. The non-GX LaserWriter drivers also use the black & white QuickDraw. QuickDraw GX, however, uses the Color QuickDraw model, which lets the patterns behind outlined text show through. If you print your card with the non-GX StyleWriter and LaserWriter 300 drivers, while set to grayscale, they give you the same result as QuickDraw GX drivers because of Color QuickDraw.

The workaround is to use the non-GX print drivers. Another alternative is to use the QuickDraw GX Helper to turn off desktop printing for the application during this print operation.

System 7.5.1: Sharing Removable Volumes (6/95)

Revised: 6/30/95
Security: Everyone

System 7.5.1: Sharing Removable Volumes (6/95)

Article Created: 29 June 1995

TOPIC -----

I understood that System 7.5.1 supported sharing removable volumes on the fly. But when I eject one of my CD discs, insert another, and choose "Sharing" under the file menu, I get the following error:

"One or more items could not be shared, because not all volumes are available for file sharing."

DISCUSSION -----

System 7.5.1 does support sharing removable media and automatically shares CD discs when they are inserted. Once inserted, it takes a moment or two to prepare the given volume for file sharing. You do not need to open the Sharing window unless you wish to change the access privileges of that volume.

If you attempt to open the Sharing window before the operating system is ready to share the volume, you get the error indicated above. Click the "OK" button and choose "Sharing" again, by that time, the volume is ready to be shared, and the "Sharing" window opens normally.

Performa with CD: Can I Make Emergency Disk? (8/95)

Article Created: 29 June 1995
Article Reviewed/Updated: 28 August 1995

TOPIC -----

I have a Macintosh Performa computer. I have purchased a third-party disk management utility which states I should use a Disk Tools disk to create an emergency disk. I did not receive one with my computer. How can I create an emergency disk?

DISCUSSION -----

If you do not have a CD-ROM drive built into your computer, or do not have a Macintosh Performa CD, your Utilities floppy disk effectively replaces the Disk Tools disk. Note, however, that depending on the version of system software you are using, your third-party utility may not be able to use the Utilities disk in place of Disk Tools to create an emergency disk. You will have to contact the third-party software vendor to get specific instructions about whether or not you can make the emergency disk with the Utilities disk.

However, in many cases you may not need an emergency disk to troubleshoot and fix your problems. Apple currently ships a CD-ROM drive as part of many Performa computers. If you received a Macintosh Performa CD as part of your bundle, that effectively replaces a conventional Disk Tools or Utilities disk. In addition to containing conventional disk diagnostic software, it also contains a complete backup of your system software.

In many cases, it is possible to use the Performa CD as a start-up disk, then insert a diskette containing whatever third-party diagnostic or disk management utility software you need to run. In other words, even if you cannot make an emergency disk, you may still be able to start up your computer and use your diagnostic software.

Follow these steps to start your Performa 6100 series computer from your startup CD:

With Your Computer Turned On

=====

Follow these steps to start your Performa 6100 series computer from your startup CD:

Step 1

Insert the CD-ROM disc

Step 2

Under the Special menu, choose Restart.

Step 3

Hold down the c (lower case C) key until you see "Welcome to Macintosh".

With Your Macintosh Turned On

=====

Follow the steps in either Method 1 or Method 2 to start any CD-ROM equipped Macintosh computer from your startup CD:

Method 1

Step 1

Insert the CD-ROM disc.

Step 2

Under the Apple menu, choose Control Panels.

Step 3

Double click on Startup Disk control panel.

Step 4

In the Startup Disk control panel, click on the CD-ROM icon to highlight it.

Step 5

Close the Startup Disk control panel and restart your Macintosh.

Method 2

Step 1

Insert the CD-ROM disc

Step 2

Under the Special menu, choose Restart.

Step 3

Immediately hold down the Shift-Option-Command-Delete keys.

Step 4

Continue holding these four keys until you see the "Welcome to Macintosh" screen.

The first device mounted on your desktop beneath the Application menu is the device that your computer used to startup.

DOS Compatibility Card: Using Macintosh Disks in DOS (6/95)

Revised: 6/30/95
Security: Everyone

DOS Compatibility Card: Using Macintosh Disks in DOS (6/95)

=====

Article Created: 30 June 1995

TOPIC -----

My Macintosh DOS Compatible computer ejects Macintosh formatted disks when I am in the MS-DOS environment. This is inconvenient because I am attempting to reformat these disks as PC disks in the MS-DOS environment. Why is this happening? How can I reformat the disks?

DISCUSSION -----

Using PC Exchange, the Macintosh environment is able to read and format MS-DOS disks. However, the MS-DOS environment does not have software enabling it to read Macintosh formatted disks. So, in order to prevent accidental erasure of the data on a Macintosh formatted disk, the disk is automatically ejected on the DOS side.*

To use Macintosh formatted disks on the DOS side, you must first reformat them in the Macintosh environment using PC Exchange. To do this:

1. Switch to the Macintosh environment using the Command-Return shortcut.
2. Insert the unlocked Macintosh disk
3. Highlight the disk icon
4. Select Erase Disk from the Special menu
5. Change the format to DOS 1.4 MB (high-density disks) or DOS 720k (low density disks)
6. Click Erase

*Note: The Power Macintosh DOS Compatibility Read Me file incorrectly states that both PC and Macintosh floppy disks are automatically mounted when inserted

into the floppy drive in either operating environment.

Postscript Errors Printing From MAE to Sparc Printer (6/95)

Revised: 6/30/95
Security: Everyone

Postscript Errors Printing From MAE to Sparc Printer (6/95)

=====

Article Created: 30 June 1995

TOPIC -----

I'm having a problem printing from MAE 2.0 on a Sun workstation with SunOS Solaris 2.3 using Newsprint 2.5 to a Sun Sparcprinter. This printer works fine in UNIX. I've tried both lp and lpr, and selected LPRWriter with the Generic printer description, and I get the following error printed without any other text: error offending command, f3_1. Do you know what is wrong?

DISCUSSION -----

This Sun configuration ships with only the courier font enabled. For additional postscript fonts to be used (as needed by MAE), the Font Password must be ordered from Sun which licenses these fonts.

Power Macintosh 8500/120: Description (5/97)

Article Created: 3 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article contains a description of the Power Macintosh 8500/120 computer.

DISCUSSION -----

Overview

=====

If your profession demands a high-performance, expandable computer that can handle any media as easily as text, the Apple Power Macintosh 8500/120 system is for you. Featuring a new Power Macintosh architecture with even greater multimedia capabilities than previous models, the 8500/120 is the system of choice for in-house publishing, media authoring, and technical applications.

Built-in video input and output capability of near-broadcast quality, high-resolution graphics (up to 1,280 by 1,024 pixels), and CD-quality stereo sound add vitality to professional projects and let you explore new computer-enabled applications. For example, the Power Macintosh 8500/120 supports the capture of quarter-screen video in real time. Combine this capability with Apple's QuickTime software, and media authoring has never been easier.

Three Peripheral Component Interconnect (PCI) slots let you take advantage of a wide range of high-performance expansion cards. Because PCI is an industry standard, you can find inexpensive PCI cards for a variety of uses, including video compression, video production, and high-speed networking. Many PCI cards include the necessary software to work with Macintosh systems.

With a PowerPC 604 RISC processor running at 120 megahertz that you can upgrade yourself when faster versions become available, the Power Macintosh 8500/120 offers high-end PowerPC technology now—with plenty of room to grow later.

..TIL18068-Power_Macintosh_8500-120-Description_5-97_(TA33983).pdf

Power Macintosh 8500 systems run most applications written for 680x0-based Macintosh computers, as well as applications that have been accelerated to take advantage of their PowerPC processors. By adding SoftWindows software from Insignia Systems, you can also run MS-DOS and Windows applications, enabling the 8500 to fit into almost any computing environment.

The Power Macintosh 8500/120: Exceptional performance for handling even the most complex computing tasks and enhancing your creativity.

Features

=====

High Performance

- 120-MHz PowerPC 604 processor, user upgradable to faster processor when available (up to 150 MHz)
- Built-in floating-point processor and 32K cache
- 256K level-2 cache on a DIMM

Communications and multimedia

- 64-bit VRAM graphics subsystem
- Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- Quadruple-speed CD-ROM drive
- 16-bit stereo audio input and output
- 24-bit composite and S-video input and output
- Support for speech-recognition and text-to-speech capabilities
- Optimized for QuickTime Conferencing software

Expandability

- Three industry-standard PCI expansion slots
- SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- Internal expansion bay for additional hard disk drive

Compatibility

- 10Base-T and AAUI Ethernet connectors
- Open Transport networking software (TCP/IP and AppleTalk)
- Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- Allows you to open and use MS-DOS 6.0 and Windows 3.1 documents and disks
- Runs MS-DOS and Windows applications via SoftWindows software (not included) System 7.5 software
- Makes working with different applications consistent, so they are easier to learn and use
- Allows easy customization of your Macintosh to reflect the way you work
- Provides active assistance in learning new features with Apple Guide

Included Software

=====

The Power Macintosh 8500/120 series comes with Macintosh System Software 7.5.2. The following Apple and third-party software is also included:

- Apple Telecom 2.1
- Megaphone 1.0.2sp (which does not include the 30-day trial of Megaphone's advanced telephony features)
- Drive Setup 1.0 (a new version, with a new user interface, of the hard drive setup utility that included support for: partitioning drives, larger drive volumes - up to 2 terabytes - and removable media drives)
- CD-ROM 5.1
- Energy Saver
- Energy Saver Apple Guide (on-line active assistance)
- Apple Video Player (Allows simple display, capture and cut and paste of video input)
- Sound & Displays control panel (replaces the current Monitors, Sounds, and AV Setup control panels, providing a simplified interface that makes all of the video, monitor, and sound input and output much more accessible and usable)
- Sound & Displays Apple Guide (on-line active assistance)
- Control Strip (like the control strip on PowerBooks)
- PlainTalk 1.4 (which includes all the new TTS voices and a scaled back version of the Speech Recognition)
- Simple Sound (which provides users with an easy way to record sounds)
- QuickTime 2.09
- QuickDraw 3D
- Video Shop (AVID VideoShop 3.0.2 will be included to support an out-of-box editing solution)
- Lotus Notes Express (a \$99 value, Lotus Notes Express introduces Power Macintosh customers to this industry-standard "groupware" product and gives them access to seven frequently used Lotus Notes applications)

What's In The Box

=====

The Power Macintosh 8500 series computers will ship with the following components in the box:

- Power Macintosh 8500/120 computer
- Mouse
- PlainTalk Microphone
- Power cable
- Power Macintosh 8500 User's Guide
- Power Macintosh 8500 Technical Specifications
- Power Macintosh 8500 bootable CD
- Product Registration card
- PCI Brochure
- RSA coupon
- Apple Resource Guide
- Warranty Card, decals, software license agreement, Visa application form
- Packing Slip

Ordering Information

=====

Power Macintosh 8500/120 16/1 GB/4xCD Configuration*

- Power Macintosh 8500/120 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1 GB hard disk drive, an internal quadruple-speed CD-ROM drive, and a PlainTalk microphone
- Order No. M3104LL/A

Power Macintosh 8500/120 16/2 GB/4xCD Configuration*

- Power Macintosh 8500/120 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2 GB hard disk drive, an internal quadruple-speed CD-ROM drive, and a PlainTalk microphone
- Order No. M3105LL/A

Power Macintosh 8500 Logic Board Upgrade

- Owners of the Macintosh Quadra 800 and 840AV; Workgroup Server 80 and 8150; and Power Macintosh 8100/80, 8100/100, and 8100/110 will be able to upgrade to the Power Macintosh 8500/120 via a logic board upgrade.
- Order No. M3807LL/A

NOTE: This upgrade will not be available until 2 months after the introduction date of the Power Macintosh 8500 series computers.

Power Macintosh GeoPort Telecom Adapter

- Order No. M3127LL/A

* All configurations include mouse; system software version 7.5.2; Check with your Apple reseller for the most current information about product specifications and configurations.

Power Macintosh 8500/120: Technical Specifications (9/96)

Revised: 9/30/96
Security: Everyone

Power Macintosh 8500/120: Technical Specifications (9/96)

Article Created: 3 July 1995
Article Reviewed/Updated: 18 September 1996

TOPIC -----

This article contains a list of technical specifications for the Power Macintosh 8500/120 computer.

DISCUSSION -----

Upgradable Microprocessor

- PowerPC 604 microprocessor running at 120 MHz, upgradable to 250 MHz processor when available
- Integrated floating-point unit, 32K cache, and three integer units
- High-speed system bus (up to 50 MHz)

Memory

- RAM: 16 MB of RAM, expandable to 512 MB via 8 DIMM sockets
(Note: There is no RAM soldered to the logic board. The DIMM sizes installed at the factory will vary according to availability; there will be either two 8 MB DIMMs or one 16 MB DIMM. If you are installing more RAM, the DIMMs should be 64-bit-wide, 168-pin fast-paged mode, with 70-ns RAM access times or faster.)
- Standard Level 2 (L2) Cache: 256K L2 cache on a 160-pin DIMM
(Theoretical support for up to 4 MB of L2 cache.)
- VRAM: DIMMs must be 32-bit-wide, 112-pin fast-paged mode with 70ns RAM access time or faster. Do not use the 256 K or 512 K VRAM SIMMs used in older Macintosh computers
- 4 MB of ROM

Disk Drives

- Internal 1 GB or 2 GB Fast SCSI hard disk
- Internal Apple SuperDrive floppy disk drive

- Accepts high-density 1.4 MB disks and 800K disks
- Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal AppleCD 600i quadruple-speed CD-ROM drive
- Expansion bay for additional 3.5-inch hard disk

Interfaces

- Three PCI expansion slots compatible with PCI 2.0-compliant cards (Note: These slots are not NuBus-compatible)
- Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- 10Base-T and AAUI-15 Ethernet connectors
- Internal Fast SCSI bus (up to 10 MB/s)
- External SCSI bus (up to 5 MB/s)
- Apple Desktop Bus (ADB) expansion port
- RCA phono jacks for line-level stereo audio input and output
- Mini jacks for stereo audio input and output
- All sound ports support 16-bit audio and up to 44.1-kHz sampling rate
- DB-15 connector for monitor
- Composite connectors (RCA phono jacks) for composite video input and output
- S-video input and output connectors
- Internal digital audio/video (DAV) connector for video compression/decompression cards

Audio System

- Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC)—capable of driving stereo miniplug headphones or audio equipment—and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound
- 16-bit stereo input and output
- Sample rates of 44.1 and 22.05 kilohertz (kHz)
- Sound input connector line level: 2.8 volts peak-to-peak (Vpp) nominal, into 3.0-kilohm (k) impedance (minimum)
- RCA-type input connector line level: 2.4 Vpp nominal, into 13.5-k impedance (minimum)
- Sound output connector line level: 2.7 Vpp nominal, into 32-k impedance
- RCA-type output connector level: 2.9 Vpp nominal into 2-k impedance (minimum)
- Sound input signal-to-noise ratio (SNR): >83 decibels (dB) A-weighted with no audible discrete tones
- RCA-type input SNR: >77 dB A-weighted with no audible discrete tones
- Sound output SNR: >84 dB A-weighted with no audible discrete tones
- RCA-type output SNR: >84 dB A-weighted with no audible discrete tones
- Bandwidth: 10 Hz to 18 kHz (+0.1 dB, -3.0 dB) at 44.1-kHz sample rate
- RCA-type input total harmonic distortion plus noise (THD + N): less than 0.018 percent A-weighted; measured 10 Hz to 30 kHz with a 2.4-Vpp sine wave input

Video Input/Output Subsystem

- 24-bit video input

- Real-time video playthrough of up to 640 by 480 pixels with NTSC;
768 by 576 pixels with PAL and SECAM
- Up to 320- by 240-pixel capture at 25 frames per second with
NTSC (with 2 GB drive)
- Maximum capture size of 640 by 480 pixels with NTSC
- 24-bit video output
 - Support for NTSC and PAL
 - Convolution for flicker reduction at all bit depths

Graphics Support

- 2 MB of VRAM, expandable to 4 MB
- Fast 64-bit data path to VRAM
- Support for display resolutions of up to 1,280 by 1,024 pixels
- 24-bit color up to 1,152- by 870-pixel resolution
- Refresh rate of up to 75 Hz

GeoPort Telephony*

- 14.4-Kbit/s modem support
- V.17 fax support
- GeoPort Fax and GeoPort Telephony software included
- Speakerphone and answering-machine capability

* Note: Requires GeoPort Telecom Adapter

Clock/Calendar

- Custom integrated circuit with long-life battery

Keyboard And Mouse

- Supports ADB keyboards with numeric keypads
- Comes with an ADB Mouse II

Electrical Requirements And Compliance

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 225 W maximum, not including display

ADB Power Requirements

- Maximum current draw for all devices: 500 mA
(a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard used)

Size And Weight

- Height: 14 in. (35.6 cm)
- Width: 7.7 in. (19.6 cm)
- Depth: 15.75 in. (40.0 cm)

- Weight: 25 lb. (11.3 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116 degrees F
(-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 7500 Series: Description (4/97)

Revised: 5/2/97
Security: Everyone

Power Macintosh 7500 Series: Description (4/97)

Article Created: 3 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article contains a description of the Power Macintosh 7500/100 series of computers.

DISCUSSION -----

Overview

The Apple Power Macintosh 7500/100 computer is a professional computer with a new architecture that offers more flexible capabilities than previous models. If you need increased performance and expandability for your business, regardless of its size, the 7500/100 delivers—and preserves your investment into the future.

Built-in video input capability, high-resolution graphics (up to 1,280 by 1,024 pixels), and CD-quality stereo sound add vitality to everyday business projects and let you explore new computer-enabled applications. For example, the Power Macintosh 7500/100 optimizes the transfer of video data between a network and the computer's display monitor, making this an ideal system for videoconferencing. Apple's own QuickTime Conferencing software is even included.

Power Macintosh 7500 systems include three Peripheral Component Interconnect (PCI) expansion slots. Because PCI is an industry standard, you can find inexpensive PCI cards for a variety of uses, including video-conferencing, connection to faster peripherals, and high-speed networking. Many PCI cards include the necessary software to work with Macintosh systems. PCI support allows you to standardize on one type of card in your organization, saving you support time and dollars.

Connecting your computer to an Ethernet network is easier than ever with the Power Macintosh 7500, because it includes both AAUI and 10Base-T connectors.

With a PowerPC 601 RISC processor running at 100 megahertz that you can upgrade to an even more powerful 604 processor, the Power Macintosh 7500/100 gives you all the advantages of PowerPC technology now—with plenty of room to grow later.

Power Macintosh 7500 systems run most applications written for 680x0-based Macintosh computers, as well as applications that have been accelerated to take advantage of their PowerPC processors. By adding SoftWindows software from Insignia Systems, you can also run MS-DOS and Windows applications, enabling the 7500 to fit into almost any computing environment.

Whether you are selecting computers for a large corporation or a one-person home office, the Power Macintosh 7500/100 system's PowerPC performance and PCI expandability offer the versatility you need for professional computing.

Features

=====

High Performance

- 100-MHz PowerPC 601 processor, user upgradable to 604 processor
- Built-in floating-point processor and 32K cache

Communications and multimedia

- 64-bit VRAM graphics subsystem
- Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- Quadruple-speed CD-ROM drive
- 16-bit stereo audio input and output
- 24-bit composite and S-video input
- Support for speech-recognition and text-to-speech capabilities
- Optimized for QuickTime Conferencing software

Expandability

- Three industry-standard PCI expansion slots
- SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- Internal expansion bay for additional hard disk drive

Compatibility

- 10Base-T and AAUI Ethernet connectors
- Open Transport networking software (TCP/IP and AppleTalk)
- Runs most 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- Allows you to open and use MS-DOS 6.0 and Windows 3.1 documents and disks
- Runs MS-DOS and Windows applications via SoftWindows software (not included)

System 7.5 Software

- Makes working with different applications consistent, so they are easier

to learn and use

- Allows easy customization of your Macintosh to reflect the way you work
- Provides active assistance in learning new features with Apple Guide

Included Software

=====

The Power Macintosh 7500 series comes with Macintosh System Software 7.5.2. The following Apple and third-party software is also included:

- Apple Telecom 2.1
- Megaphone 1.02sp (which does NOT include the 30-day trial of Megaphone's advanced telephony features)
- Drive Setup 1.0 (a new version, with a new user interface, of the hard drive setup utility that includes support for: partitioning drives, larger drive volumes—up to 2 terabytes—and removable media drives)
- CD-ROM 5.1
- Energy Saver
- Energy Saver Apple Guide (on-line active assistance)
- Apple Video Player (Allows simple display, capture and cut and paste of video input)
- Apple VideoPhone (Apple VideoPhone uses the built-in QuickTime Live API to provide a point to point video conferencing over a LAN network)
- Sound & Displays control panel (replaces the current Monitors, Sounds, and AV Setup control panels, providing a simplified interface that makes all of the video, monitor, and sound input and output much more accessible and usable)
- Sound & Displays Apple Guide (on-line active assistance))
- Control Strip (like the control strip on PowerBooks)
- PlainTalk 1.4 (which includes all the new TTS voices and a scaled back version of the Speech Recognition)
- Simple Sound (which provides users with an easy way to record sounds)
- QuickTime 2.09
- QuickDraw 3D
- Video Shop (AVID VideoShop 3.0 will be included to support an out-of-box editing solution)
- Lotus Notes Express (a \$99 value, Lotus Notes Express introduces Power Macintosh customers to this industry-standard "groupware" product and gives them access to seven frequently used Lotus Notes applications)

What's In The Box

=====

The Power Macintosh 7500 series computers will ship with the following components in the box:

- Power Macintosh 7500 series computer
- Mouse
- PlainTalk Microphone
- Power cable
- Power Macintosh 7500 User's Guide

- Power Macintosh 7500 Technical Specifications
- Power Macintosh 7500 bootable CD
- Product Registration card
- PCI Brochure
- RSA coupon
- Apple Resource Guide
- Warranty Card, decals, software license agreement, Visa application form
- Packing Slip

Ordering Information

=====

Power Macintosh 7500/100 16/500/4xCD configuration*

- Power Macintosh 7500/100 computer with 16/16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 500 MB hard disk drive, an internal quadruple-speed CD-ROM drive, and a PlainTalk microphone
- Order No. M3100LL/A

Power Macintosh 7500/100 16/1 GB/4xCD configuration*

- Power Macintosh 7500/100 computer with 16/16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1 GB hard disk drive, an internal quadruple-speed CD-ROM drive, and a PlainTalk microphone
- Order No. M3102LL/A

Power Macintosh GeoPort Telecom Adapter

- Order No. M3127LL/A

* All configurations include mouse; system software version 7.5.2;

Open Transport 1.0.1 Patch Information (7/95)

Revised: 7/5/95
Security: Everyone

Open Transport 1.0.1 Patch Information (7/95)

=====

Article Created: 5 July 1995

TOPIC -----

I'm having problems using Open Transport 1.0 with some network applications like Fetch, Eudora, or Netscape. How can I get them to work?

DISCUSSION -----

A patch to Open Transport version 1.0 has been released. Users who are experiencing problems sending files (using programs such as Fetch) or using SLIP and PPP LAPs should try installing, Open Transport 1.0.1 patch.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Information From the Read Me File
=====

Problems Truncating Data When Sending and Open Transport 1.0.1

This patch fixes a problem truncating data when sending, which occurred with the Open Transport TCP backward compatible (MacTCP) interface. Using Open Transport 1.0 in certain situations, the connection could be closed before all of the data was transferred. In this case, the receiver would get a short file, missing some of the bytes at the end, and may not have (depending on the application used) received an error indicating this problem had occurred.

Changes in Open Transport 1.0.1 for SLIP/PPP LAPs From Open Transport 1.0

-
- Fixed a crash that would occur shortly after the completion of automatic connection with some LAPs (Link Access Protocol) like MacPPP and MacSLIP. This would occur when the LAP displays a dialog box during its connection establishment.

NOTE: With Open Transport 1.0 and 1.0.1, automatic connections are possible only for direct connections or very rapid modem connections (less than 15 seconds).

- Open Transport now works correctly with InterPPP or MacPPP when they coexist in the same System Folder with other SLIP and PPP LAPs. With Open Transport 1.0, InterPPP or MacPPP could be selected in the TCP/IP control panel, but they couldn't connect if they existed in the same System Folder. For example, the connect button of the Config PPP control panel of MacPPP would be dimmed.

- Fixed problem with MacSLIP. With Open Transport 1.0, MacSLIP could be selected in the TCP/IP control panel, but opening a TCP/IP endpoint would fail. Typically an application would display an alert like "Cannot open name resolver".

MAE 2.0: Timbuktu Pro Does Not Work With TCP/IP (7/95)

Revised: 7/5/95
Security: Everyone

MAE 2.0: Timbuktu Pro Does Not Work With TCP/IP (7/95)

=====

Article Created: 5 July 1995

TOPIC -----

I have MAE 2.0 and I'm running Timbuktu Pro which works properly with AppleTalk, but fails when using TCP/IP. Why is this happening?

DISCUSSION -----

The reason Timbuktu Pro does not work with MAE 2.0 and TCP/IP is due to the version of MacTCP in MAE 2.0. According to the Timtukbu Pro release notes, Timtukbu Pro requires at least MacTCP version 2.x. The version shipped with MAE 2.0 is based on MacTCP 1.1.x.

This issue has been reported to Engineering as a compatibility problem. We have no information on if or when this issue will be addressed.

LaserWriter 16/600 PS: Cannot Receive Faxes with ECM (7/95)

Revised: 7/5/95
Security: Everyone

LaserWriter 16/600 PS: Cannot Receive Faxes with ECM (7/95)

=====

Article Created: 05 July 1995

TOPIC -----

What causes the LaserWriter 16/600 PS to only receive the first inch of a sent fax? When this happens, the sender also receives an error message. This occurs when sending a fax from different fax machines, such as the Canon t400, Canon 630, Canon Fax 270, and a Pitney Bowes 9550. Faxes sent from other machines are received properly.

DISCUSSION -----

Apple worked with Canon to verify that this is related to an option on the sending machines called ECM (Error Correction Mode). When the sender selects ECM, the fax fails. However, the same fax job is completed successfully with ECM turned off.

The work around is to turn off error correction on the sending machines. Please note that this problem potentially could happen from other fax machines besides those listed above.

LaserWriter 8: Tray Selection Printing from Finder (9/95)

Revised: 9/1/95
Security: Everyone

LaserWriter 8: Tray Selection Printing from Finder (9/95)

=====

Article Created: 05 July 1995
Article Reviewed/Updated: 01 September 1995

TOPIC -----

On a LaserWriter Pro 600 or 630 and the LaserWriter 16/600 PS with the 500-sheet cassette, printing from the Finder only applies tray selections to the first print job. This is apparent using SimpleText if one selects the following options in the Print window:

First From: Cassette (250) Sheets
Remaining From: Cassette (500) Sheets

If you use different paper in both cassettes, you will notice that after it prints the first file correctly (first page from 250, successive from 500), it then starts printing every page from the 250 sheet cassette. Printing each file individually from within SimpleText works fine.

DISCUSSION -----

This is a known issue and is due to how various applications and the LaserWriter driver manipulate the print record. In simple terms, it is up to the application and print driver to store information (such as paper tray use) so that it can be used for successive jobs in a scenario such as the one you described. There has been some past confusion in the developer community with regard to this. As a result, engineering has decided to resolve this issue by modifying the next version of the LaserWriter driver (beyond 8.3) to ensure that paper tray information is saved and used appropriately.

In the interim, there is only one good workaround we are aware of:

- Use QuickDraw GX.

If QuickDraw GX is being used, this is NOT a problem. QuickDraw GX is very feature rich with respect to paper tray usage, as each individual page of a document has its own "definition" or paper type. For example, you can define the

first page of a document to be LetterHead and a second page to be plain paper, and if the 250-sheet and 500-sheet cassette have been defined respectively as such then tray selection is automatic -- the first page of each document comes from the 250-sheet cassette, and the second from the 500-sheet cassette.

Paper types such as LetterHead can be defined/created with the QuickDraw GX Paper Type editor that ships with QuickDraw GX. In terms of "setting" each page of a document to be of a defined paper type, this functionality is ONLY present with QuickDraw GX aware applications (such as WordPerfect 3.1) via the "Custom Page Setup" menu item in the File menu. Custom Page Setup is the recommended user interface for utilizing GX paper types.

One less graceful workaround is to print the files individually.

LaserWriter 8.3: Does Not Create Desktop Fax Sender (8/95)

Revised: 8/3/95
Security: Everyone

LaserWriter 8.3: Does Not Create Desktop Fax Sender (8/95)

=====

Article Created: 03 August 1995

TOPIC -----

After installing LaserWriter 8.3 software and using the new desktop printing functionality without QuickDraw GX, the Fax Sender chooser item does not create a desktop printer.

I am confused because Fax Sender does not have a corresponding desktop printer yet it does work.

Are there any compatibility issues with 3rd party print drivers and desktop printers?

DISCUSSION -----

The new Desktop Printing software only supports Apple print drivers, and specifically, only the ones that use PrintMonitor. The ability to create a desktop icon for the Fax Sender driver is being considered for the next version of Desktop Printing software.

The new Desktop Printing software is designed to replace the old PrintMonitor, therefore, any driver that uses PrintMonitor is compatible with the new Desktop Printing software.

The Desktop Printing software has been tested with all of the Apple PostScript and QuickDraw "PrintMonitor-saavy" print drivers including: LW 7.x, 8.x, 8.xf, LaserWriter Select 300, StyleWriter II, and others. Apple ran some simple tests with LaserWriter 8.2.2f and successfully sent PostScript fax jobs via the desktop printer. Tests were also run with Adobe's PS Printer drivers 8.2 and 8.3 with no problems found. The only print drivers that will not have a desktop printer created are third party drivers that have their own printmonitor-type applications. It is only these 3rd party QuickDraw direct connect drivers where Desktop Printing is bypassed and the third party software takes precedence.

With regards to PostScript/network printers, the LaserWriter 8.x driver uses the

PPD files of the 3rd party PostScript printer, and then creates a desktop printer.

DMF Formatted Disks: Second Disk Installation Fails (10/96)

Revised: 10/30/96
Security: Everyone

DMF Formatted Disks: Second Disk Installation Fails (10/96)

=====

Article Created: 05 July 1995
Article Reviewed/Updated: 30 October 1996

TOPIC -----

I am trying to install Word 6.0 for Windows on my DOS Compatible Macintosh. The first disk installs correctly but then fails on the second disk. I have gotten a new copy of the software but this copy does not read from drive A, I get a message saying, "System Error". When I try to cancel the installation, I get a message saying the compressed file can't be decompressed, and it may be corrupted.

I am also unable to mount the disks with PC Exchange.

DISCUSSION -----

Microsoft uses a new disk format, DMF (Distributed Media Format) that lets them ship their software on a small number of disks by using a 1.6 MB floppy disk format. The current PC Compatible (360K/720K/1.4MB) or Apple (400K/800K/1.4MB) floppy drives cannot read this type of format.

The disk set for Microsoft Word 6.0 for Windows contains one 1.4 MB disk with an installer program and other 1.6 MB formatted disks. Although the 1.6 MB disks cannot normally be read by the floppy drive, the installer modifies the hardware-level floppy driver and DOS BIOS calls, which enables the PC to read the new format.

The Microsoft DMF installer program may be incompatible with the Macintosh DOS Compatible computers, as well as the Insignia SoftWindows product. The installer attempts to modify the DOS BIOS and hardware-level floppy driver, which can not be done in these hardware emulation implementations.

There is a Fix

PC Exchange 2.0.7 lets DMF formatted disks be used with Macintosh DOS Compatible computers. PC Exchange 2.0.7 available with the DOS Compatibility 1.5 Software

Update for Power Macintosh/Performa 6100 DOS Compatible, Macintosh Performa 630, 640CD DOS Compatible, and Macintosh LC 630 DOS Compatible computers. The DOS Compatibility 1.5 update is available at Apple Computer's Software Updates locations online, or a disk set can be mailed for a shipping and handling charge by contacting 1-800-SOS-APPL (1-800-767-2775).

The DOS Compatibility 1.5 Software Update is not supported on the Quadra or Centris 610 DOS Compatible computers.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

DISCUSSION -----

Page 6-33

In describing using Linkto, instructs the user:

2. With the Button tool still selected, double-click the button you want to link.

The problem is that the Button Info dialog box does not display the Link to button, unless you hold down the option key while double-clicking the button you want to link. Per the instruction, the Button Info dialog box shows the Tasks button.

The manual should read:

2. With the Button tool still selected, hold down the Option key on your keyboard and double-click the button you want to link.

Pages 3-22 and 6-37

In describing adding visual effects, instructs the user:

1. Choose the button tool and double-click the Next button.

The Button Info Dialog box appears.

2. Click the Effect button.

There is no Effect button unless the user holds down the Option key while double-clicking on the Next button.

The manual should read:

1. Choose the button tool, hold down the Option key on your keyboard, and double-click the Next button

The Button Info Dialog box appears.

2. Click the Effect button.

Incorrect Screen Shots

Pages 2-29, 4-20, 6-3, and 6-17 of HyperCard Reference manual show screen shots of the incorrect version of the Button Info window.

Appendix B, page 141 of the Getting Started manual documents the replacement of the LinkTo and Effects buttons with the Tasks button and shows the correct screen shot.

Power Macintosh 7500 Series: Technical Specifications (9/96)

Revised: 9/17/96
Security: Everyone

Power Macintosh 7500 Series: Technical Specifications (9/96)

Article Created: 6 July 1995
Article Reviewed/Updated: 17 September 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 7500 series of computers.

DISCUSSION -----

Upgradable Microprocessor

- PowerPC 601 microprocessor running at 100 MHz, upgradable to PowerPC 604 microprocessor
- Integrated floating-point unit and 32K cache
- High-speed system bus (up to 50 MHz)

Memory

- RAM: 16 MB of RAM, expandable to 512 MB via 8 DIMM sockets
(Note: There is no RAM soldered to the logic board. The DIMM sizes installed at the factory will vary according to availability; there will be either two 8 MB DIMMs or one 16 MB DIMM. If you are installing more RAM, the DIMMs should be 64-bit-wide, 168-pin fast-paged mode, with 70-ns RAM access times or faster.)
- Optional Level 2 (L2) Cache: L2 Cache Slot for optional 256K, 512K, or 1MB L2 cache on a 160-pin DIMM. (Theoretical Support for up to 4 MB of L2 cache.)
- VRAM: 2 MB of VRAM, expandable to 4 MB.
DIMMs must be 32-bit-wide, 112-pin fast-paged mode with 70ns RAM access time or faster. Do not use the 256 K or 512 K VRAM SIMMs used in older Macintosh computers.
- 4 MB of ROM

Disk Drives

- Internal 500 MB or 1 GB Fast SCSI hard disk

- Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4 MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal AppleCD 600i quadruple-speed CD-ROM drive
- Expansion bay for additional 3.5-inch hard disk

Interfaces

- Three PCI expansion slots compatible with PCI 2.0-compliant cards (Note: These slots are not NuBus-compatible)
- Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- 10Base-T and AAUI-15 Ethernet connectors
- Internal Fast SCSI bus (up to 10 MB/s)
- External SCSI bus (up to 5 MB/s)
- Apple Desktop Bus (ADB) expansion port
- RCA phono jacks for line-level stereo audio input and output
- Mini jacks for stereo audio input and output
- All sound ports support 16-bit audio and up to 44.1-kHz sampling rate
- DB-15 connector for monitor
- Composite connectors (RCA phono jacks) for composite video input
- S-video input connector
- Internal digital audio/video (DAV) connector for video compression/decompression cards 24-bit video input
- Real-time video playthrough of up to 640 by 480 pixels with NTSC and 768 by 576 pixels with PAL and SECAM
- Up to 320- by 240-pixel capture at 15 frames per second with NTSC
- Maximum capture size of 640 by 480 pixels with NTSC

Audio System

- Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC)—capable of driving stereo miniplug headphones or audio equipment—and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound
- 16-bit stereo input and output
- Sample rates of 44.1 and 22.05 kilohertz (kHz)
- Sound input connector line level: 2.8 volts peak-to-peak (Vpp) nominal, into 3.0-kilohm (k) impedance (minimum)
- RCA-type input connector line level: 2.4 Vpp nominal, into 13.5-k impedance (minimum)
- Sound output connector line level: 2.7 Vpp nominal, into 32-k impedance
- RCA-type output connector level: 2.9 Vpp nominal into 2-k impedance (minimum)
- Sound input signal-to-noise ratio (SNR): >83 decibels (dB) A-weighted with no audible discrete tones
- RCA-type input SNR: >77 dB A-weighted with no audible discrete tones
- Sound output SNR: >84 dB A-weighted with no audible discrete tones
- RCA-type output SNR: >84 dB A-weighted with no audible discrete tones
- Bandwidth: 10 Hz to 18 kHz (+0.1 dB, -3.0 dB) at 44.1-kHz sample rate
- RCA-type input total harmonic distortion plus noise (THD + N): less than 0.018 percent A-weighted; measured 10 Hz to 30 kHz with a 2.4-Vpp sine

wave input

Graphics Support

- 2 MB of VRAM, expandable to 4 MB
- Fast 64-bit data path to VRAM
- Support for display resolutions of up to 1,280 by 1,024 pixels
- 24-bit color of up to 1,152- by 870-pixel resolution
- Refresh rate of up to 75 Hz

GeoPort Telephony*

- 14.4-Kbit/s modem support
- V.17 fax support
- GeoPort Fax and GeoPort Telephony software included
- Speakerphone and answering-machine capability

* Requires GeoPort Telecom Adapter

Clock/Calendar

- Custom integrated circuit with long-life battery

Keyboard And Mouse

- Supports ADB keyboards with numeric keypads
- Comes with an ADB Mouse II

Electrical Requirements And Compliance

- Line voltage: 100 to 240 V AC, RMS single phase
- Frequency: 50 to 60 Hz, single phase
- Power: 150 W maximum, not including display

ADB Power Requirements

- Maximum current draw for all devices: 500 mA
(a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard used)

Size And Weight

- Height: 6.15 in. (15.6 cm)
- Width: 14.37 in. (36.5 cm)
- Depth: 16.93 in. (43.0 cm)
- Weight: 22 lb. (9.97 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116 degrees F
(-40 degrees to 47 degrees C)

..TIL18080-Power_Macintosh_7500_Series-Technical_Specifications_9-96.pdf

- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:

Security: Everyone

Power Macintosh 7200/75 & 7200/90: Description (4/97)

Article Created: 6 July 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article contains a description of the Power Macintosh 7200/75 and 7200/90 computers.

DISCUSSION -----

Overview
=====

Apple Power Macintosh 7200/75 and Power Macintosh 7200/90 systems offer enhanced expandability and performance that make them ideal for small and medium-size businesses, for home offices, and for running productivity applications in any size of organization.

Each Power Macintosh 7200 computer comes with three Peripheral Component Interconnect (PCI) slots for high-performance expansion cards. Because PCI is an industry standard, you can find inexpensive PCI cards for a variety of uses, including graphics, faster communications with peripherals, and high-speed networking. Many PCI cards include the necessary software to work with Macintosh systems.

Power Macintosh 7200 systems enable you to incorporate high-resolution graphics and stereo sound into your business, education, and personal projects. Both models support screen resolutions of up to 1,280 by 1,024 pixels. They also come with Apple's GeoPort Fax and GeoPort Telephony software (requires GeoPort Telecom Adapter).

The graphics, telephony, and expansion capabilities are all implemented with the legendary plug-and-play simplicity of Macintosh computers. Even complex solutions become easy to use with the Power Macintosh 7200 series.

Built with high-efficiency PowerPC 601 processors, Power Macintosh 7200

..TIL18081-Power_Macintosh_7200-75_and_7200-90-Description_4-97.pdf

computers offer you a performance choice of 75 or 90 megahertz operation. Whichever speed you choose, you get all the advantages of PowerPC technology. If your computing needs later increase, either model can be upgraded to a Power Macintosh 7500 system.

Power Macintosh 7200 systems run virtually all applications written for 680x0-based Macintosh computers, as well as applications that have been accelerated to take advantage of PowerPC processors. By adding SoftWindows software from Insignia Systems, you can also run MS-DOS and Windows applications, enabling the 7200 series to fit into almost any computing environment.

Whether you need power and expandability for everyday number crunching, office productivity, or an innovative multimedia project, Apple Power Macintosh 7200 systems offer the features you need at an affordable price.

Features

=====

High Performance

- 75- or 90-MHz PowerPC 601 processor
- Built-in floating-point processor and 32K cache
- Built-in graphics acceleration

Communications And Multimedia

- Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- Quadruple-speed CD-ROM drive
- 16-bit stereo audio input and output

Expandability

- Three industry-standard PCI expansion slots
- SCSI connector for external hard disks, CD-ROM drives, and other SCSI devices
- Internal expansion bay for additional storage device
- Up to 256MB of RAM
- Up to 4MB of VRAM

Compatibility

- 10Base-T and AAUI Ethernet connectors
- AppleTalk networking
- Open Transport networking software (TCP/IP and AppleTalk)
- Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- Allows you to open and use MS-DOS 6.0 and Windows 3.1 documents
- Runs MS-DOS and Windows applications via SoftWindows software (not included)
- Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disks
- System 7.5 software

..TIL18081-Power_Macintosh_7200-75_and_7200-90-Description_4-97.pdf

- Makes working with different applications consistent, so they are easier to learn and use
- Allows easy customization of your Macintosh to reflect the way you work
- Provides active assistance in learning new features with Apple Guide

Included Software

=====

The Power Macintosh 7200 series comes with Macintosh System Software 7.5.2. The following Apple and third-party software is also included:

- Apple Telecom 2.1
- Megaphone 1.02sp (which does NOT include the 30-day trial of Megaphone's advanced telephony features)
- Drive Setup 1.0 (a new version, with a new user interface, of the hard drive setup utility that includes support for: partitioning drives, larger drive volumes—up to 2 terabytes—and removable media drives)
- CD-ROM 5.1 (new driver software that offers CD+ compatibility)
- Energy Saver (provides compliancy with Energy Star requirements)
- Energy Saver Apple Guide (on-line active assistance)
- Lotus Notes Express (a \$99 value, Lotus Notes Express introduces Power Macintosh customers to this industry-standard "groupware" product and gives them access to seven frequently used Lotus Notes applications)

What's In The Box

=====

The Power Macintosh 7200 series computers will ship with the following components in the box:

- Power Macintosh 7200 series computer
- Mouse
- Power cable
- Power Macintosh 7200 User's Guide
- Power Macintosh 7200 Technical Specifications
- Power Macintosh 7200 bootable CD
- Product Registration card
- PCI Brochure
- RSA coupon
- Apple Resource Guide
- Warranty Card, decals, software license agreement, Visa application form
- Packing Slip

Ordering Information

=====

Power Macintosh 7200/75 8/500/4xCD*

- Power Macintosh 7200/75 computer with 8MB of RAM, a built-in 1.4MB Apple SuperDrive floppy disk drive, an internal 500 MB hard disk drive, and an internal quadruple-speed CD-ROM drive.
- Order No. M4303LL/A

Power Macintosh 7200/90 8/500/4xCD*

-
- Power Macintosh 7200/90 computer with 8 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 500MB hard disk drive, and an internal quadruple-speed CD-ROM drive.
 - Order No. M4082LL/A

Power Macintosh GeoPort Telecom Adapter

-
- Order No. M3127LL/A

* All configurations include mouse; system software version 7.5.2; complete setup, learning, and reference documentation; and limited warranty.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Internal HD Format: Fails To Recognize Hard Drive (7/95)

Revised: 7/6/95
Security: Everyone

Internal HD Format: Fails To Recognize Hard Drive (7/95)

Article Created: 05 July 1995

TOPIC -----

Non-Apple utilities, such as Drive 7, can be used to reformat the internal IDE drive installed on some Macintosh computers. However, when you subsequently attempt to reformat the drive with Apple's Internal HD Format, you get an error message stating that no drive was found, and to use Apple HD SC Setup instead.

What is causing Internal Hard Drive Format to fail in this situation? Is there a work around?

DISCUSSION -----

The Drive 7 software replaces the original driver with its own ATA driver, and thus prevents any other hard drive utility, such as Apple's Internal HD Format, from modifying or deleting its driver. Internal Hard Drive Format recognizes that it is unable to modify the driver and therefore states that it cannot see a valid drive.

Drive 7 users can remove the partition code from their IDE drive by selecting "Unpartition ATA disk" from the Functions menu in the Drive 7 application. This information is documented in Drive 7's Read Me file as well as the user manual. However, Drive 7's error message should not be telling users to use Apple HD SC Setup. Apple has contacted Casa Blanca Works and recommended that they change this message in future versions.

For additional assistance with this issue, you should contact Casa Blanca Works. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Power Macintosh 7200/75 & 7200/90: Specifications (9/96)

=====

Article Created: 6 July 1995
Article Reviewed/Updated: 10 September 1996

TOPIC -----

This article contains a list of technical specifications for the Power Macintosh 7200/75 and 7200/90.

DISCUSSION -----

Microprocessor

- PowerPC 601 microprocessor running at 75 MHz (7200/75 model)
- PowerPC 601 microprocessor running at 90 MHz (7200/90 model)
- Integrated floating-point unit and 32K cache

Memory

- 8 MB of RAM, expandable to 256 MB via 4 DIMM sockets
(Note: There is no RAM soldered to the logic board. The DIMM sizes installed at the factory will vary according to availability; there will be either two 4 MB DIMMs or one 8 MB DIMM.)
- Level 2 (L2) Cache: L2 Cache Slot for Optional 256KL2 cache on a 160-pin DIMM. (These computers theoretically support 512K and 1 MB of L2 cache, but these configurations have not been tested and are not supported by Apple.)
- 4 MB of ROM
- 1 MB of Video RAM (VRAM) in both the Power Macintosh 7200/75 & 7200/90 models

Disk Drives

- Internal 500 MB SCSI hard disk
- Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4 MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks

- Internal AppleCD 600i quadruple-speed CD-ROM drive
- Expansion bay for additional 3.5-inch hard disk

Interfaces

- Three PCI expansion slots compatible with PCI 2.0-compliant cards
(Note: These slots are not NuBus-compatible)
- Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- 10Base-T and AAUI-15 Ethernet connectors
- Internal and external SCSI bus (up to 5 MB/s)
- Apple Desktop Bus (ADB) expansion port
- Mini jacks for stereo audio input and output
 - 16-bit audio
 - Up to 44.1-kHz sampling rate
- DB-15 connector for monitor

Audio System

- Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC)—capable of driving stereo miniplug headphones or audio equipment—and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound
 - 16-bit stereo input and output
 - Sample rates of 44.1 and 22.05 kilohertz (kHz)
 - Input line level: 2 volts peak-to-peak nominal, into 6.5-Kilohm (k) impedance
 - Output line level: 2.2 volts peak-to-peak nominal, into 1 k impedance
 - Input through output SNR*: >74 decibels (dB) typical
 - Bandwidth: 10 Hz-19 kHz (+/- 2 dB) at 44.100 kHz sample rate
 - THD+N*: Less than 0.06%; measured 30 Hz-16 kHz with a 2-Vpp sine wave input
- *SNR is signal-to-noise ratio; THD+N is total harmonic distortion plus noise.

Graphics Support

- VRAM-based accelerated graphics
- 1 MB of VRAM, expandable to 4 MB
- 64-bit data path to VRAM (with 2 MB of VRAM)
- Support for display resolutions of up to 1,280 by 1,024 pixels
- 24-bit color of up to 1,024- by 768-pixel resolution
- Refresh rate of up to 75 Hz

GeoPort Telephony*

- 14.4-Kbit/s modem support
 - V.17 fax support
 - GeoPort Fax and GeoPort Telephony software included
 - Speakerphone and answering-machine capability
- * Requires GeoPort Telecom Adapter

Clock/Calendar

- Custom integrated circuit with long-life battery

Keyboard And Mouse

- Supports ADB keyboards with numeric keypads
- Comes with an ADB Mouse II

Electrical Requirements And Compliance

- Line voltage: 100 to 240 V AC, RMS single phase
- Frequency: 50 to 60 Hz, single phase
- Power: 150 W maximum, not including display
- Energy Star compliant

ADB Power Requirements

- Maximum current draw for all devices: 500 mA
(a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard used)

Size And Weight

- Height: 6.15 in. (15.6 cm)
- Width: 14.37 in. (36.5 cm)
- Depth: 16.93 in. (43.0 cm)
- Weight: 22 lb. (9.97 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116 degrees F
(-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:

10 Sep 1996 - Clarified cache information.

PowerBook Duo Dock Plus: Description (9/95)

Revised: 9/21/95
Security: Everyone

PowerBook Duo Dock Plus: Description (9/95)

Article Created: 6 July 1995
Article Reviewed/Updated: 21 September 1995

TOPIC -----

This article contains a description of the PowerBook Duo Dock Plus.

DISCUSSION -----

Overview
=====

The Apple PowerBook Duo system is an excellent choice if you want an extremely small but powerful computer—with expansion capabilities that let you turn it into a full Macintosh desktop system.

At the heart of the PowerBook Duo system are the award-winning PowerBook Duo subnotebook computers. Weighing less than 5 pounds, they are light enough to take anywhere, yet powerful enough for any computing task.

When you are back at the office and want the capabilities of a desktop Macintosh computer, just slip your PowerBook computer into a PowerBook Duo Dock Plus. PowerLatch docking technology provides easy, reliable connections between the two, so you have instant access to such desktop resources as a large color display, full-size keyboard, mouse, printers, and network resources.

The PowerBook Duo Dock Plus supports Apple displays of up to 21 inches and has two full-size NuBus slots that let you add the capabilities you want. It also includes a high-speed Ethernet port for quick and easy access to network resources. The 1.4-megabyte Apple SuperDrive lets you read, write, and format Macintosh, Windows, and MS-DOS floppy disks. There's even room for an additional hard disk.

With this docking solution, when you want to take your work with you, you simply press the eject button and the PowerBook Duo computer slides out, ready for computing wherever you go. All of your applications and most recent files are

stored securely on the computer's hard disk drive.

And when you are away from your office, you can use the portable PowerBook Duo computer to work with external displays, CD-ROM drives, and other peripherals.

Features

=====

Ease of Use

- PowerLatch docking technology for easy, automatic, one-step docking

Disk Drive

- Internal 1.4 MB Apple SuperDrive

Display Support

- 1 MB of VRAM for thousands of colors on 17-inch displays and 256 colors on 20- and 21-inch displays
- Support for most Apple displays, including the Apple Multiple Scan 20 Display (19.1- inch diagonal viewable image size), as well as most VGA and SVGA displays

Expansion

- Two NuBus expansion slots
- Ten built-in ports, including a SCSI port for up to six peripherals, such as an external hard disk or CD-ROM

Communications

- Built-in support for high-speed Ethernet for rapid data transfer
- Pass-through port for modem in PowerBook Duo

Security

Security key for locking PowerBook Duo and slot for security cable

Ordering Information

Macintosh Duo MiniDock: Description (7/95)

=====

Article Created: 6 July 1995

TOPIC -----

This article describes the features of the Macintosh Duo MiniDock.

DISCUSSION -----

Overview

=====

The Macintosh Duo MiniDock provides expansion capabilities for the Macintosh PowerBook Duo computers.

When you are away from your office and want to work with desktop resources, you can use the portable Macintosh Duo MiniDock. It provides standard Macintosh connections to large displays, a modem, and other peripherals.

Apple's new PowerLatch docking technology ensures easy, automatic docking between the Macintosh PowerBook Duo and the Duo MiniDock, so there is no need to plug and unplug cables or to reconfigure the system each time you insert the PowerBook Duo into the Duo MiniDock.

Macintosh Duo MiniDock Features

=====

- Small size and weight for easy portability
- PowerLatch docking technology
- Built-in video support for 256 colors
- Supports most Apple displays, including the Macintosh 16" Color Display, as well as some VGA and SVGA displays

- 9 built-in ports, including SCSI port
- Slot for a security cable
- Port for connecting external floppy disk drive

Ordering Information

Open Transport 1.0.1 Patch Read Me (11/95)

Revised: 11/15/95
Security: Everyone

Open Transport 1.0.1 Patch Read Me (11/95)

Article Created: 6 July 1995
Article Reviewed/Updated: 15 November 1995

TOPIC -----

This article is the Open Transport (OT) 1.0.1 ReadMe file.

DISCUSSION -----

Open Transport 1.0.1 Patch for Power Macintosh 9500

1) Problems truncating data when sending and Open Transport 1.0.1

This patch fixes a problem truncating data when sending, which occurred with the Open Transport TCP backward compatible (MacTCP) interface. Using OT 1.0 in certain situations, the connection could be closed before all of the data was transferred. In this case, the receiver would get a short file, missing some of the bytes at the end, and may not have (depending on the application used) received an error indicating this problem had occurred.

2) Changes in OT 1.0.1 for SLIP/PPP LAPs since OT 1.0

- Fixed a crash that would occur shortly after the completion of automatic connection with some LAPs (Link Access Protocol) like MacPPP and MacSLIP. This would occur when the LAP displays some dialog during its connection establishment. NOTE: with OT 1.0 and 1.0.1 automatic connections are possible only for direct connections or very rapid modem connections (< 15 seconds).
- OT now works correctly with InterPPP or MacPPP when they coexist in the same System Folder with other SLIP and PPP LAPs. With OT 1.0, InterPPP or MacPPP could be selected in the TCP/IP control panel but they couldn't connect if they existed in the same System Folder. For example the connect button of the Config PPP control panel of MacPPP would be gray (inactive).
- Fixed problem with MacSLIP. With OT 1.0, MacSLIP could be selected in the TCP/IP control panel but opening a TCP/IP end point would fail. Typically an

application would display an alert like "Cannot open name resolver".

Miscellaneous TCP/IP LAP Information

Because of the fundamental architectural differences between MacTCP and Open Transport, we cannot insure a 100% compatibility when using SLIP and PPP Link Access Protocol (LAP) modules written for MacTCP.

The following SLIP and PPP LAPs are supported with various levels of success:

- InterSLIP
 - Version 1.0.1 is not compatible with Open Transport, you need a later version. InterCon should be contacted directly.
 - The version 1.0.1 of InterSLIP is very unstable on Power Macintosh 9500 and the version 1.0.2d2 should be used instead.
- InterPPP 1.2.9
 - With some Internet providers, the user would experience a crash with HTML readers (Netscape, NCSA Mosaic, MacWeb) when receiving large picture.
- MacSLIP 2.0.6
 - Connect at System Startup doesn't work.
- MacPPP 2.0.1
 - The way that MacPPP 2.0.1 opens a connection is mostly incompatible with OT. The same problem exists with MacPPP 2.1 SD and MacPPP 2.0.1 cm4. New releases of MacPPP will fix this problem.
 - The open button doesn't work. The only way to open a connection is by opening a TCP/IP application. However, OT might time-out before the completion of the connection so that it cannot get the correct IP address from the LAP.
 - Cannot re-connect after disconnecting MacPPP without restarting the System first.

Known General TCP/IP LAP Limitations

-
- There is currently no way to report a change of IP address to OT from a SLIP or PPP LAP. Change of IP address happens when the SLIP or PPP connection goes down or up after using a TCP/IP application. The work around is to restart the Macintosh.
 - Once a TCP/IP application is opened over a SLIP or PPP LAP, one cannot use another SLIP or PPP LAP without first restarting the Macintosh. This is the same limitation as with MacTCP except that the TCP/IP control panel does not warn you to restart the System.
 - When a SLIP or PPP LAP is selected in the TCP/IP control panel, and "Manually" is selected in the Configure pop-up menu, the value of the IP address entered in this control panel is ignored by OT. If you get assigned a static IP address by

your SLIP or PPP provider you should set it in the LAP configuration program. If the IP address is assigned dynamically, you should configure the LAP configuration program for dynamic addressing.

- BootP configuration may time-out for SLIP and PPP connection if the BootP server is busy or the connection speed is too low.
- OT TCP/IP 1.0/1.0.1 supports only LAPs that have been verified to work (with some caveats) with OT. A list of supported LAPs (identified by their creatorId) is hard coded in the product. LAPs that are not in the list will not appear in the TCP/IP control panel (in Connect Via:). The list of supported LAPs currently is comprised of: InterSlip, MacPPP, InterPPP, and MacSLIP. Note that some PPP products share the same creatorId (and actually same source base) as InterPPP and as a result appear in the TCP/IP control panel as "InterPPP". If more than one such products is installed, only the first one will be shown in the popup. Note that the user has no way of telling which one was actually selected.

LW 16/600 PS, TCP/IP, LPD, and Multiple Copies Problem (6/95)

Revised: 7/6/95
Security: Everyone

LW 16/600 PS, TCP/IP, LPD, and Multiple Copies Problem (6/95)

Article Created: 6 July 1995

TOPIC -----

I'm trying to print multiple copies of a document to a LaserWriter 16/600 PS from a Sun Workstation using the following command:

```
lpr -#3 -Progue.txt
```

My problem is only one copy prints, however the queue shows multiple copies to be printed. Is there a fix or workaround for this?

DISCUSSION -----

We test and were able to reproduce this problem. We believe this is a problem with the LaserWriter 16/600 PS printer's built-in LPD printing facility through TCP/IP. We were able to print multiple copies of a file (with the same `lpr -#n` command) to a LaserWriter 16/600 PS printer with AppleTalk from an A/UX machine however.

A workaround to print multiple copies of a file is to repeat the file name on the command line, as shown below:

```
lpr -Plw16 foo foo foo
```

We have informed engineering of this issue, however we have no information if or when a fix will be implemented.

Multiple Scan 15 Display: No Sound From Speakers (7/95)

=====

Article Created: 05 July 1995

TOPIC -----

I have a Multiple Scan 15 Display, and I do not get any sound out of the built-in speakers.

DISCUSSION -----

In order to have sound output from the speakers on the Multiple Scan 15 Display, the sound output cable, which is included with the display, must be connected. To properly connect the cable, follow these steps:

1. Attach one end of the included sound output cable to the sound output port on the back of the computer.
2. Attach the other end of the sound output cable to the sound output port on the back of the monitor.

QuickTake 100: Upgrade to QuickTake 100 Plus (Discontinued)

=====

Article Created: 06 July 1995
Article Reviewed/Updated: 15 December 1995

TOPIC -----

This article describes the QuickTake 100 Upgrade Program, which has been discontinued.

DISCUSSION -----

The QuickTake 100 Upgrade Program was in effect from August 2 to December 15, 1995. It was a firmware upgrade only; there was not any upgrade to the external housing or plastics, but the upgraded camera included a QuickTake 100 Plus label. The specific features and items included were:

- Increased storage capabilities. 1 MB of FLASH EPROM, which stores up to 32 standard-resolution images, 16 high-resolution images or a combination of high- and standard-resolution images
- Close-up Lens. Capable of provide accurate image capture from 10 to 14 inches
- Larger image size. 640 X 480 resolution (for both high- and standard-quality)
- QuickTake 150 Manual
- PhotoFlash 2.0 (for owners of the QuickTake 100 for Macintosh)
- PhotoNow! (for owners of the QuickTake 100 for Windows)

The upgraded firmware has a one-year warranty.

Disk First Aid: Extra Floppy Disk Shows in Main Window (9/95)

Revised: 9/26/95
Security: Everyone

Disk First Aid: Extra Floppy Disk Shows in Main Window (9/95)

=====

Article Created: 27 June 1995
Article Reviewed/Updated 26 September 1995

TOPIC -----

I am using Disk First Aid 7.2 after booting from Disk Tools. When Disk First Aid's main window opens I see the Disk Tools disk on the Internal Floppy Drive and I see the SCSI ID 0 for the hard drive and I also see a third floppy disk named "unknown disk". What should I do?

DISCUSSION -----

This issue has been occasionally reported to occur on PowerBooks. You should first make sure you do not have a RAM disk turned on in the memory control panel. To remove the extra floppy icon, you must reset your parameter ram using the following procedure:

Step 1

Restart your computer.

Step 2

After you hear the startup chime hold down the Command, Option, P, and R keys on the keyboard.

Step 3

Continue holding these keys down until you hear a second startup chime.

When you restart with the Disk Tools disk and run Disk First Aid, the extra floppy will be gone.

At Ease 3.0 WorkGroups: Gray Buttons In At Ease Setup (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 3.0 WorkGroups: Gray Buttons In At Ease Setup (8/95)

=====

Article Created: 06 July 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

I am in the At Ease Setup program in At Ease 3.0 for WorkGroups and I cannot select certain items. Sometimes the On and Off buttons are gray and other times, I am unable to select a Setup or a User from the lists because they are grayed out. Why is this happening?

DISCUSSION -----

You have logged into At Ease Setup as a Middle Level Administrator (MLA). The SuperUser can allow MLAs different privileges, and depending on those privileges different parts of At Ease Setup may not be available.

For example, no MLA can turn At Ease on or off, or access the network menu so these options are grayed out for every MLA. Another MLA may not be able to add or modify Setups, so when they log on the Setup list will be grayed out in addition to the On/Off buttons.

Drive Setup: Compatible With Which Computers? (7/96)

Revised: 9/23/96
Security: Everyone

Drive Setup: Compatible With Which Computers? (7/96)

Article Created: 06 July 1995
Article Reviewed/Updated: 2 July 1996

TOPIC -----

Which computers can use Drive Setup?

DISCUSSION -----

Power Macintosh computers

Drive Setup is supported on all of the current Power Macintosh computers. This includes all the original Power Macintosh computers as well as the PCI-based Power Macintosh computers.

IMPORTANT: Drive Setup is not supported with the Macintosh Processor Upgrade. If the upgrade is installed in a 64040- or 68LC040-based desktop computer with an IDE drive, use the 601 Processor Upgrade control panel to turn the card off before using Drive Setup.

The original Power Macintosh upgrade card is not supported either.

Desktop computers with IDE drives

Drive Setup is supported on 68040- or 68LC040-based desktop computers that have IDE drives installed, which includes:

- Macintosh LC 580
- Macintosh 630 series (LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640)

IMPORTANT: Drive Setup is not supported on any 68LC040 processor equipped computers without IDE drives, even if the computer has a Power Macintosh Upgrade Card installed. If Drive Setup is launched on a computer that is not supported, a dialog box appears with the message, "Drive Setup cannot be launched on this computer," and an OK button.

PowerBook computers with IDE Drives

Drive Setup is supported on most PowerBook computers with an IDE drive, which includes:

- PowerBook 190
- PowerBook Duo 2300
- PowerBook 5300

IMPORTANT: The only exception is the PowerBook 150, which must use the Internal HD Format utility.

Drive Setup 1.0.4 is included with System 7.5 Update 2.0, which is available on online services.

These articles can help you locate the software update mentioned here:

Apple RAID Software 1.0.2 Read Me (7/95)

Revised: 7/7/95
Security: Everyone

Apple RAID Software 1.0.2 Read Me (7/95)

=====

Article Created: 7 July 1995

TOPIC -----

This article is the Apple RAID Software, version 1.0.2, ReadMe file.

DISCUSSION -----

This Read Me contains important additions to the Apple RAID Software Administrator's Guide, and includes the following sections:

- 4 GB Volume Support
- Locating the Apple RAID Software Files on Your Startup Disk
- Reinstalling Apple RAID Software
- Back Up Your Data
- Initializing Apple RAID Disks With Other Disk Utilities
- Losing Power During Initialization
- Using Apple HD SC Setup With Apple RAID
- Extra Disk for Faster Recoveries
- Apple RAID and Third-Party SCSI and PDS Cards
- Apple RAID and Virtual Memory
- Using Thousands or Millions of Colors
- Choose Screen Savers Carefully
- Restoring Volumes With Retrospect
- Using the Microsoft Mail Backup Utility With Apple RAID
- Slow Startup With 2-Gigabyte Drives
- Use Shielded SCSI Cables
- Remove Switched-Off Devices From the SCSI Bus
- Do Not Use SCSI-1 Devices in a SCSI Bus Containing SCSI-2 Devices
- Handling Spontaneous Mirror Failures
- Rebuilding Mirrored Volumes While Running AppleShare
- Installing a Driver While Rebuilding a Mirrored Volume
- Restarting Stalled Rebuilds
- Dealing with Rebuild Failures

4 GB Volume Support

Apple RAID now supports volumes as large as 4 GB (rather than 2 GB as stated in the manual).

Locating the Apple RAID Software Files on Your Startup Disk

The Apple RAID Software program is installed in the Apple Menu Items folder in the System Folder on the startup disk. The Apple RAID Monitor is installed in the Extensions folder in the System Folder on the startup disk. The Apple RAID Software Read Me (this document) and the Simple Text text-processing program are installed in an Apple RAID folder in the top-most directory of your startup disk.

Reinstalling Apple RAID Software

The files for reinstalling Apple RAID are on the Workgroup Server Software CD-ROM disc (not on the Apple RAID Software CD-ROM disc as stated in the manual).

Back Up Your Data

Apple RAID mirrored volumes will not protect you from all types of data loss. Equipment theft or natural disasters such as fire or flooding, for example, can result in data loss. Therefore, make sure you continue to back up all your data, including data residing in Apple RAID mirrored or striped volumes.

Initializing Apple RAID Disks With Other Disk Utilities

Use Apple HD SC Setup or a third-party disk utility to delete or unmount the Apple RAID volumes before reinitializing an Apple RAID-formatted disk. Non-Apple RAID disk utilities may not be able to unmount Apple RAID volumes during initialization.

Losing Power During Initialization

If a disk loses power while you are initializing it with Apple RAID, it may cause your server to crash immediately or later when the system starts up. If you suspect that your server is crashing due to this problem, start up your server with the offending disk switched off. Turn the disk on while the Finder is active and initialize the disk with Apple HD SC Setup or a third-party disk utility. If this initialization is successful, then reinitialize the disk with Apple RAID.

Using Apple HD SC Setup With Apple RAID

- Updating the Driver on Apple RAID-formatted Disks

Always use the "Install Driver" command on the Disk menu in Apple RAID if you need to update the driver file on Apple RAID-formatted disks. Never use Apple HD SC Setup to update the driver on an Apple RAID-formatted disk, even though version 7.3.4 of Apple HD SC Setup allows you to do this, and the instructions for installing new versions of system software instruct you to do this. If you

use Apple HD SC Setup instead of Apple RAID to update the driver file, you will lose all data contained in the RAID volumes on the disk. However, you can retrieve your data if the Apple RAID partition map is intact. Start the Apple RAID program, select the disk, and choose "Install Driver" from the Disk menu. If this option is not enabled, the Apple RAID partition map has been damaged and no recovery is possible; you need to reinitialize the disk.

- A Message Indicates an Apple RAID Disk has no Initialized Volumes

When scanning for disks in the Apple HD SC Setup program, Apple RAID-initialized disks might display the message "This disk contains no initialized Macintosh volumes." The current version of Apple HD SC Setup does not recognize Apple RAID mirrored or striped volumes and will display the above message if the disk does not contain an Apple RAID standard (HFS) volume.

Extra Disk for Faster Recoveries

An extra disk that is initialized for Apple RAID, connected to the server, and switched on will reduce the time required to recover an Apple RAID mirror volume from a failed disk. (The extra disk must be large enough to hold the mirror volume.) Having such an extra disk on hand is recommended but not required for using Apple RAID Software.

Apple RAID and Third-Party SCSI and PDS Cards

Apple RAID supports built-in SCSI buses only; it has not been tested with third-party SCSI accelerator cards. You may experience difficulties if Apple RAID is installed on a server that contains a third-party SCSI card. The same is true for SCSI PDS cards.

Apple RAID and Virtual Memory

Apple RAID makes extensive use of direct memory access and may not work with virtual memory turned on. Make sure that virtual memory is turned off on your server.

Using Thousands or Millions of Colors

Using thousands or millions of colors on a server may degrade performance and cause problems with Apple RAID. If you experience problems creating new volumes with Apple RAID, set your server to 256 colors or fewer in the Monitors control panel. You can also try an alternative method for creating new volumes: instead of Shift-clicking disks in the Disks column and dragging them to the Volumes column in the Setup window, use the Apple RAID menu commands for creating a new volume, as explained in Chapter 3 of the Apple RAID Software Administrator's Guide.

Choose Screen Savers Carefully

There are many screen savers that can be used to prevent screen burn-in on Workgroup Servers. Some screen savers are quite elaborate and perform many complex calculations to draw a single picture on the screen. Since such calculations require significant amounts of CPU time, more complex screen savers

reduce the performance of your Workgroup Server. Choose a screen saver that interferes least with your Workgroup Server, such as a screen saver built-in to an application that you run.

Some screen savers or their modules are not compatible with Apple RAID Software and can cause your Workgroup Server to crash or hang. Before purchasing or using a screen saver, check with the screen saver's manufacturer to determine if the screen saver will work properly with your Workgroup Server and with Apple RAID.

Restoring Volumes with Retrospect

If your Apple RAID volume icon appears as a generic hard disk icon after you restore with Retrospect, you can recover the Apple RAID volume icon as follows:

- 1) Select an Apple RAID volume of the same type (mirrored, striped, or standard).
- 2) Choose Get Info from the File menu, click on the icon, and choose Copy from the Edit menu.
- 3) Select the Apple RAID volume with the generic icon.
- 4) Choose Get Info from the File menu, click on the icon, and choose Paste from the Edit menu.

The icon will be restored.

Using the Microsoft Mail Backup Utility With Apple RAID

Due to the way in which the Microsoft Mail Backup Utility shuts down the system, the automatic backup feature of Microsoft Mail causes mirrored volumes to become out of sync. The best way to back up your Microsoft Mail Server is to follow the instructions for a manual backup in the Microsoft Mail documentation.

Slow Startup With 2-Gigabyte Drives

Some 2-gigabyte disks take a long time to reach full speed. Apple RAID might wait for such disks to spin up, which may increase the time it takes to start up your server if a 2-gigabyte drive is attached.

Use Shielded SCSI Cables

Make sure all SCSI cables are shielded. You might experience I/O errors when adding additional disks to the SCSI chain if the cables aren't shielded. A shielded SCSI cable is thicker and stiffer than an unshielded SCSI cable. Check with the manufacturer if you're unsure whether the cable is shielded. All Apple SCSI cables are shielded.

Remove Switched-Off Devices From the SCSI Bus

Apple recommends that you remove from the SCSI bus, SCSI devices that are switched off and unnecessary for your work. Removing unused devices avoids signal strength problems for the remaining devices on the bus.

Do Not Use SCSI-1 Devices in a SCSI Bus Containing SCSI-2 Devices

Older disks, usually under 200 megabytes in size, cause trouble when connected to a SCSI bus containing SCSI-2 devices. Most older disks are only SCSI-1-compliant and are not always compatible with a bus using SCSI-2 devices.

Handling Spontaneous Mirror Failures

Sometimes a mirror volume may fail for no apparent reason. The volume will rebuild with no problem and disk test utilities will show no defects. In most cases the disk that failed will develop a media failure within a few weeks. If a disk begins to cause spontaneous mirror failures, consider replacing the disk before it fails completely.

Rebuilding Mirror Volumes While Running AppleShare

When rebuilding a failed or out-of-sync mirror volume while AppleShare is running, set the AppleShare Remote User Activity slide bar to less than 50%. If AppleShare is under particularly heavy use, set the slide bar to an even smaller percentage of the processor's time. These settings ensure that Apple RAID will receive the necessary processing time to perform the rebuild. (See your AppleShare documentation for details about setting the Remote User Activity slide bar.)

Installing a Driver While Rebuilding a Mirror Volume

Apple recommends that you do not update the Apple RAID driver on a disk on which a mirrored volume is currently being rebuilt.

Restarting Stalled Rebuilds

If there appears to be no disk activity during a rebuild, the rebuild may be stalled. Restarting the system should cause the rebuild to continue.

Dealing with Rebuild Failures

If a rebuild failure occurs, check that all devices on the SCSI bus are properly attached, terminated, and powered on. Retry the rebuild with the rebuild rate slide bar set to less than 75% of maximum.

Macintosh: Resetting PRAM Resets Some Video Cards (7/95)

Revised: 7/7/95
Security: Everyone

Macintosh: Resetting PRAM Resets Some Video Cards (7/95)

=====

Article Created: 7 July 1995

TOPIC -----

I have a SuperMac video card in my Macintosh computer. When I reset (zapped) my PRAM (Parameter RAM), the monitor became out of sync. What should I do to correct this?

DISCUSSION -----

SuperMac cards must be configured for the specific display they are connected to. If you move the card to a different slot in your Macintosh, connect a different monitor to it, or reset (zap) PRAM, you need to reconfigure the card to output the proper signals and timings required by your display.

How To Reconfigure
=====

Step 1

Hold down the Option key on your keyboard at startup.

Step 2

Release the Option key when the "Round Robin" configuration cycle begins.

Step 3

When you see an image of a keyboard, on your screen, that is clear, centered, and at the resolution you want to use, press the Space bar. The computer restarts, and the card and display should now be properly configured.

Apple Multiple Scan Displays: X-Ray Level Emitted (7/95)

Revised: 7/7/95
Security: Everyone

Apple Multiple Scan Displays: X-Ray Level Emitted (7/95)

=====

Article Created: 07 July 1995

TOPIC -----

I have an Apple Multiple Scan 17 Display and an Apple Multiple Scan 20 Display.
Do these monitors emit X-Rays?

DISCUSSION -----

All CRTs (cathode ray tubes) in displays emit some level of X-rays. X-rays are emitted as a byproduct of the high (anode) voltage that is needed to develop an image on the face (front) of the tube. X-rays are reduced using a variety of techniques like adding certain metals to the CRT glass to add shielding and reducing or limiting the anode voltage.

In most countries, the level of X-radiation from displays and televisions are legally controlled or regulated. In the United States, acceptable X-ray levels are defined by the FDA (Food and Drug Administration) CFR-21 regulations for consumer safety. The definition usually contains levels or thresholds that define acceptable vs. unacceptable limits to protect consumers.

The FDA CFR-21 dictates that X-ray levels for monitors must be lower or less than 5 milliroentgens per hour. The FDA has also defined another level in CFR-21 that is better than the acceptable limit by a factor of ten (at 0.5 milliroentgens per hour). The Apple Multiple Scan 17 and 20 Displays have X-ray levels below 0.5 milliroentgens per hour.

Apple Media Tool: Slow QuickTime When Controller Enabled (7/95)

Revised: 7/7/95
Security: Everyone

Apple Media Tool: Slow QuickTime When Controller Enabled (7/95)

=====

Article Created: 07 July 1995

TOPIC -----

I am using the Apple Media Tool, and I get slow, jerky playback of my QuickTime movie when the QuickTime controller bar is enabled. Movies play fine if the controller bar is not present.

DISCUSSION -----

The slower playback is normal when running a project from within the Apple Media Tool program. Controller performance is corrected when the project is made into a runtime.

To check true QuickTime performance:

Step 1

Save project as text.

Step 2

Use Runtime Maker to compile the saved text file (.k file) into a runtime.

Step 3

Evaluate QuickTime performance in the runtime.

Sound Manager 3.1: ReadMe File (7/95)

Revised: 2/13/96
Security: Everyone

Sound Manager 3.1: ReadMe File (7/95)

Article Created: 07 July 1995

TOPIC -----

This article contains the Read Me file for the Sound Manager 3.1 extension.

DISCUSSION -----

WELCOME TO SOUND MANAGER 3.1

The Sound Manager 3.1 software consists of

- the Sound Manager system software extension
- a new version of the Sound Control Panel
- a technical note explaining some of the new features

Available since the introduction of the Macintosh II in 1987, the Sound Manager is Apple's digital audio software solution that allows any application to play and record sounds using the built-in sound hardware found on Macintosh computers. Sound Manager 3.0, released in 1993, added support for 16-bit CD-quality audio, redirection of sound to third-party hardware cards, and plug-in audio compression/decompression software (codecs).

Sound Manager 3.1 adds two new audio codecs, significant performance increases on the Power Macintosh line of computers, better integration with QuickTime, and asynchronous alert sounds. It is completely backwards compatible with previous versions of the Sound Manager.

INSTALLING SOUND MANAGER 3.1

To install Sound Manager 3.1:

1. If you received a floppy disk labeled "Sound Manager", insert it into your computer and open it. If you downloaded Sound Manager 3.1

electronically, make sure the Sound Manager files you downloaded are visible.

2. Drag the Sound Manager and Sound control panel icons from the Sound Manager disk onto your System Folder icon (not into the open folder).
3. Click OK in the dialog box that appears.
4. Restart your Macintosh.

NEW FEATURES OF SOUND MANAGER 3.1

1.) New audio codecs

The Sound Manager previously supported only MACE audio compression at ratios of 3:1 and 6:1. Sound Manager 3.1 adds two new compression formats: IMA and uLaw.

The IMA 4:1 audio compression format is based on a standard proposed by the Interactive Multimedia Association, and is used to compress 16-bit sound with a ratio of 4:1. It is particularly good at compressing CD-quality music and is fully integrated into QuickTime.

The uLaw 2:1 format (pronounced "mu-law") is an international standard for compressing voice-quality audio (typically 16-bit, 8 kHz speech) with a ratio of 2:1. It is often used in telephony applications, and also on the Internet as the encoding format for ".au" sound files.

2.) Better performance on Power Macintosh

Sound Manager 3.1 is much faster on Power Macintosh computers --in many cases 4-7 times more efficient than previous versions. This means that your application can do more while sound is playing or recording. Sound Manager 3.1 is also more robust: many bugs have been fixed and a number of commonly requested features have been added. Refer to the Technical Note for more information.

3.) Improved integration with QuickTime

QuickTime 2.1 uses the new audio codecs included in Sound Manager 3.1 to allow compressed audio capture in the IMA and uLaw formats and compressed audio export from a movie to an AIFF file. QuickTime 2.1 will also use Sound Manager 3.1 to directly import common audio file formats such as ".wav" and ".au".

4.) Support for asynchronous alert sounds

The Sound Manager previously tied up your Macintosh while playing an alert sound, forcing you to wait until the sound was done playing before you could continue. Sound Manager 3.1 removes this limitation by playing alert sounds asynchronously, so alert dialogs and other interface elements can continue processing while the alert sound is playing.

Article Reviewed/Updated: 16 November 1995

TOPIC -----

I have a Macintosh computer with an AppleCD 300 Plus. My CD-ROM tray does not always open when I press the eject button. Is this normal?

DISCUSSION -----

On tray loading CD-ROM drives like the AppleCD 300 Plus and the AppleCD 600, the tray can only be opened with the button when:

- There is nothing in the drive.
- The CD-ROM software has not loaded.

At all other times, you must request that the system software eject the CD. This can be done by dragging the CD to the Trash, or by clicking on the CD icon, and then choosing "Put Away" from the File menu.

To eject a CD from a computer at start up, press and hold the eject button until the CD is ejected.

If you find that you cannot eject the CD tray with no CD-ROM in the drive, please contact the Apple Assistance Center at 800-SOS-APPL for further support.

Security: Everyone

Desktop Printing: Allocating Memory (9/95)

Article Created: 7 July 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

What is the benefit of changing the Desktop PrintMonitor's or a given Desktop Printer's preferred memory size?

DISCUSSION -----

This article describes the benefit of changing the preferred memory size of the Desktop PrintMonitor or a given Desktop Printer.

Desktop PrintMonitor's Preferred Memory

The Desktop PrintMonitor requires approximately 6K for each Desktop Printer created on a 680x0 Macintosh computer and 9K for each Desktop Printer on a Power Macintosh computer. The default setting of 160K lets you create approximately eight Desktop Printers on a 680x0 Macintosh and four on a Power Macintosh.

If you create more Desktop Printers than can be supported by the Desktop PrintMonitor, an appropriate alert is given the next time you attempt to print. This alert instructs you to increase the memory size of the Desktop PrintMonitor, but does not indicate by how much. If you follow the 6K per printer for 680x0 Macintosh computers and 9K per printer for Power Macintosh computers rule of thumb when adjusting memory, you will avoid further low memory problems with the Desktop PrintMonitor.

Desktop Printer's Preferred Memory

Increasing the preferred memory size in a Desktop Printer's Get Info window lets the Desktop Printer handle larger, more complex print jobs without asking you to increase memory to the printer. Most of the time, you never have to make adjustments to a Desktop Printer's memory size.

The default memory size for Desktop Printers will be ample for most printing

tasks. When it is not, the Desktop Printer temporarily increases its memory size by 50%. If this adjustment is not adequate, a message appears asking if you would like the Desktop Printer to temporarily adjust its size an additional 50%.

You may need to permanently increase a Desktop Printer's memory if you regularly print large, complex documents. A typical document of this type might include a full page, true color image, employ ColorSync, and print to a color laser printer.

Desktop Printing: Identified Issues (1/96)

Revised: 9/30/96
Security: Everyone

Desktop Printing: Identified Issues (1/96)

Article Created: 7 July 1995
Article Reviewed/Updated: 17 January 1996

TOPIC -----

This article describes several identified issues when using desktop printing.

DISCUSSION -----

- If you try to create a Desktop Printer when the Desktop Printer Spooler is not in the System Folder, multiple Desktop Printers are generated. The only way to stop this is to reboot with extensions off.

Status: Fixed with Desktop PrintMonitor v1.0.2 and later.

- A similar problem can occur if your system crashes while a spool file is being generated. The only resolution if this happens is to restart with extensions off and remove the spool file from the PrintMonitor Documents folder.

Status: Currently under investigation.

- The Finder crashes if you try to create a Desktop Printer in the "Restricted Finder" of At Ease 3.0.

Status: Fixed in Desktop Printer software v1.0.3.

- Scheduled, non-network backups crash Retrospect if version 1.0 of the Desktop Printing software is installed. This version shipped with a limited number of StyleWriter 1200 Printers.

Status: Fixed in Desktop Printer software version 1.0.1 and later.

- A generic Desktop Printer is created when PDF Writer v.2.0 creates a PDF in

the background. This printer is fully functional, but is not supported.

- The View menu is available when a Desktop Printer's Get Info window is in the foreground. If you try to use this menu, a bus error results.

Status: Fixed in Desktop Printer software v1.0.3.

Article Change History:

17 Jan 1996 - Changed distribution status.

28 Nov 1995 - Updated with fixes implemented in version 1.0.3.

Apple Macintosh CD: v1.0,1.0.1,2.0 Extras Folder ReadMe (4/97)

Revised: 4/3/97
Security: Everyone

Apple Macintosh CD: v1.0,1.0.1,2.0 Extras Folder ReadMe (4/97)

=====

Article Created: 07 July 1995
Article Reviewed/Updated: 03 April 1997

TOPIC -----

The following article is the Read Me document for the Extras folder on the Apple Macintosh CD--versions 1.0, 1.0.1, and 2.0.

It is different than the ReadMe file found in the Apple Extras folder on the Power Macintosh CD--versions 1.0 and 2.0 (for that ReadMe file see TIL Article: "Power Macintosh CD: v1.0, 2.0 Extras Folder ReadMe").

DISCUSSION -----

The Extras folder contains several application programs and control panels for you to try on your Power Macintosh computer. You can use these programs to learn about new System 7.5 features. The programs are listed below. Most of the programs are in individual folders, and are accompanied by information explaining how to use the programs.

IMPORTANT If you have questions about third-party application programs in the Extras Folder, you should contact the software vendor directly. The telephone number or address for each vendor is located with the software program.

Eric's Solitaire Sample

The solitaire games include Klondike and Eight-off (by Delta Tao Software, Inc.).

Important: In order to run this application, you must be booted off the hard drive rather than the CD.

Video Monitor

To use the Video Monitor program, you must have a Power Macintosh 6100/60AV, 7100/66AV, or 8100/80AV; and you must have video equipment connected to your computer's video ports. You can use the Video Monitor program to display video

images in a window and to capture or print one frame of a video image. For basic instructions for using Video Monitor, pull down the Guide (question mark) menu and choose Macintosh Guide. You'll find information about Video Monitor in the Macintosh Guide index. The Video Monitor Read Me file inside the Video Monitor folder contains additional information.

FusionRecorder

This audio and video capture program records and plays high-quality sound and, if you have an AV-equipped Power Macintosh, QuickTime video movies. For instructions, see the FusionRecorder Read Me files.

HyperCard Player

HyperCard Player is an application program that lets you balance your checkbook, play games, organize addresses, and accomplish many other tasks. Read "What is HyperCard?" in the HyperCard Player 2.2 folder for more information.

QuickTime

QuickTime lets you add video, animation, sound, and other effects to your documents. See the QuickTime Read Me file for more information.

Graphing Calculator

This is a handy calculator program which demonstrates your Power Macintosh computer's speed, and shows how speed can improve a Macintosh application program's performance. For more information about this program, start the program and select Help from the Equation menu. You can also view a self-running demonstration program by selecting Full Demo from the Demo menu.

Text-to-Speech

A feature that allows your Macintosh to speak to you. See About Text-to-Speech in the Text-to-Speech folder for information on trying the text-to-speech feature.

PlainTalk for Power Macintosh

This software offers you speech recognition and text-to-speech. With speech recognition, you can speak standard Macintosh menu commands out loud, and create your own speech-activated commands. IMPORTANT: You must have an Apple AudioVision Monitor or a PlainTalk Microphone to use speech recognition. Text-to-speech lets your Macintosh speak to you. For more information, see the "About Text-to-Speech" file in the Text-to-Speech folder. In order to install QuicKeys™, you must be booted off the hard drive rather than the CD.

PowerTalk Extras Folder

Apple's PowerTalk Direct Dial-up Mail lets you exchange mail with PowerTalk users everywhere—not just on your computer network. If you have a modem and a telephone line, you can connect with other PowerTalk users and exchange mail and documents.

You can use PowerTalk's universal mailbox for sending to and receiving from a variety of sources, including CompuServe, faxes, the Internet, pagers, and QuickMail. When installed on your Macintosh or Powerbook computer, a personal gateway provides direct access to a specific communication service.

For more information, open the Apple PowerTalk Tour folder and double-click the PowerTalk Tour icon.

QuickDraw GX Extras Folder

QuickDraw GX Print Extensions by Peirce Software, Inc. enhance the QuickDraw GX printing capabilities. With these print extensions you can print watermarks in the background of each page, and print 2,3,4, 6, 9, or 16 pages on each printed page. For more information, see the "Peirce Instructions & Info" file in the Peirce Watermark & Paper Saver folder.

Linotype-Hell's QuickDraw GX Type Expo is a tour of new features found in QuickDraw GX fonts. See "About the GX Type Expo" in the GX Type Expo folder for more information.

The software products contained in this folder are products of parties other than Apple Computer, Inc., and Apple's inclusion of these software products with this CD constitutes neither an endorsement nor a recommendation of the products by Apple. Apple assumes no responsibility with regard to the performance, or use of the software. All understandings, agreements, or warranties take place directly between the product vendors and you.

Power Macintosh CD: v1.0, 2.0 Extras Folder ReadMe (7/95)

Revised: 7/7/95
Security: Everyone

Power Macintosh CD: v1.0, 2.0 Extras Folder ReadMe (7/95)

=====

Article Created: 07 July 1995

TOPIC -----

The following article is the readme document for the Apple Extras folder on the Power Macintosh CD--versions 1.0 and 2.0.

It is different than the readme file found in the Extras folder on the Apple Macintosh CD--versions 1.0, 1.0.1, and 2.0 (for that ReadMe file see TIL Article: "Apple Macintosh CD: v1.0,1.0.1,2.0 Extras Folder ReadMe").

DISCUSSION -----

The Apple Extras folder contains several application programs and control panels for you to try on your Power Macintosh. Each program is in its own folder, along with a document that explains how to use the program.

- **AppleScript:** Use AppleScript to automate any actions you do repeatedly on your computer--like opening a document, reformatting it, and printing it out. AppleScript can record your actions so you can do them in one step next time, using a single keyboard command. AppleScript is explained in detail in "Getting Started With AppleScript," which you'll find in the AppleScript folder. (You'll use DocViewer to view "Getting Started With AppleScript." DocViewer is explained at the end of this document.)

The version of AppleScript that you received with your computer includes AppleScript basics. With this version, you can create scripts to control any scriptable application programs you have installed on your Macintosh. If you want additional scripting options, see an Apple-authorized dealer for information about the AppleScript Scripter's Kit. The Scripter's Kit contains additional AppleScript software and manuals. (Macintosh software developers may also wish to order the "AppleScript Developer's Toolkit 1.1," available from APDA.)

- **CPU Energy Saver** (for Power Macintosh 7100/66, 7100/66AV, 8100/80, and 8100/80AV computers): You can set the computer to turn on or off automatically,

using the CPU Energy Saver control panel. The CPU Energy Saver Read Me file explains how to install and use this control panel. IMPORTANT: CPU Energy Saver does not work on Power Macintosh 6100/60 or 6100/60AV computers.

- Energy Saver (for monitors): This control panel lets you set your monitor to go into low power mode after your computer has been idle for a specified amount of time. The Energy Saver Read Me file explains how to install and use this control panel.
- FusionRecorder: This audio and video capture program records and plays high-quality sound and, if you have an AV-equipped Power Macintosh, QuickTime video movies. For instructions, see the FusionRecorder Read Me file. (You'll use DocViewer to view the FusionRecorder Read Me file. DocViewer is explained at the end of this document.)
- LaserWriter 8.1.1: The LaserWriter 8.1.1 program is special software (called a "driver") that your Macintosh uses when you print documents. To install LaserWriter 8.1.1, follow the instructions in the LaserWriter 8.1.1 Read Me file.
- Graphing Calculator: This program demonstrates your Power Macintosh computer's speed, and shows how speed can improve a Macintosh application program's performance. For more information about this program, start the program and select Help from the Equation menu. You can also view a self-running demonstration program by selecting Full Demo from the Demo menu.
- Video Monitor: To use the Video Monitor program, you must have a Power Macintosh 6100/60AV, 7100/66AV, or 8100/80AV; and you must have video equipment connected to your computer's video ports. You can use the Video Monitor program to display video images in a window and to capture or print one frame of a video image. Basic instructions for using Video Monitor are provided in the Getting Started manual that came with your computer. The Video Monitor Read Me file contains additional information.
- DocViewer: To view the AppleScript Guide or the FusionRecorder Read Me file, you use a program called DocViewer. DocViewer displays files for you to read on the screen. You can also use it to search for specific topics in files, and print out pages of information. The DocViewer Read Me file explains how to use DocViewer.

Apple Media Conference: Using TCP/IP w/ PowerTalk Installed 8/95

Revised: 8/15/95
Security: Everyone

Apple Media Conference: Using TCP/IP w/ PowerTalk Installed 8/95

=====

Article Created: 10 July 1995
Article Reviewed/Updated: 15 August 1995

TOPIC -----

I cannot use TCP/IP addresses in Apple Media Conference with PowerTalk Collaboration Services activated. I have to open the PowerTalk Setup control panel deactivate Collaboration Services, then restart my Macintosh. Is there any way to use both PowerTalk and TCP/IP from within Apple Media Conference?

DISCUSSION -----

Although you can select TCP/IP as the default for watching or broadcasting, this preference is not used when PowerTalk Collaboration Services is activated. With PowerTalk active, the PowerTalk dialog always appears when trying to watch or broadcast a QuickTime Conference. To enter TCP/IP addresses instead of using the PowerTalk dialog, hold down the OPTION key when choosing Broadcast or Watch from the File menu.

DOS Compatibility Card: Playing Audio CD-ROMs (7/95)

Revised: 7/10/95
Security: Everyone

DOS Compatibility Card: Playing Audio CD-ROMs (7/95)

=====

Article Created: 10 July 1995

TOPIC -----

I have a Power Macintosh 6100 DOS Compatible with a built-in AppleCD 300i plus CD-ROM drive. Can I play audio Compact Discs from within Microsoft Windows?

DISCUSSION -----

With the DOS Compatibility Card in the Power Macintosh 6100 series, Macintosh Performa 6100 series, or Macintosh 630 series, you have the ability to play audio Compact Discs in Microsoft Windows if you are using an AppleCD 150, AppleCD 300, or AppleCD 300 Plus CD-ROM drive. Before you can play an audio CD, however you must configure Windows to play them.

Another option is to the Mac OS to play Audio CD-ROM discs using the AppleCD Audio Player. When you switch back to MS-DOS or Windows environment, the Audio CD-ROM will continue playing.

Configuring Windows For Audio CD-ROM Discs

=====

Step 1

Open the Main group

Step 2

Open the Control Panel and Double-Click the Drivers icon.

Step 3

Click on Add

Step 4

Select [MCI] CD Audio

Step 5

Insert Windows disk 5 and type in "A:\" in the dialog box that appears.

Step 6

Click the 'OK' button to install the driver from the floppy disk.

A dialog appears informing you that one CDROM drive was detected.

Step 7

Click the 'OK' button, and close all open windows except the Program Manager window.

Microsoft Windows is now configured to play Audio Compact Discs.

Playing Audio CD-ROM Discs

=====

Step 1

Open the Accessories group

Step 2

Double-click on the Media Player icon.

Step 3

Insert an Audio CD into the CD-ROM drive.

Step 4

Choose CD Audio from the Device menu

Step 5

Click the Play button.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, Performa 640, LC 630, and Quadra 630.

The following computers are in the Macintosh Performa 6100 series: Performa 6110, Performa 6112, Performa 6115, Performa 6117, and Performa 6118.

Macintosh: Startup from CD-ROM & Hard Disk Does Not Mount (7/95)

Revised: 7/10/95
Security: Everyone

Macintosh: Startup from CD-ROM & Hard Disk Does Not Mount (7/95)

=====

Article Created: 10 July 1995

TOPIC -----

When I start up my Macintosh computer from a CD-ROM disc while pressing Command-Option-Shift-Delete, my hard disk fails to mount on the desktop along with the CD-ROM volume.

DISCUSSION -----

The failure of the hard disk to mount in this circumstance can be caused by a number of specific factors, such as the ROMs of the particular Macintosh computer being used and the system software version on the CD-ROM. In general, however, this occurs by pressing Command-Option-Shift-Delete longer than necessary. When held down for an extended time, these keys may be interpreted differently during startup, which can produce undesired effects such as the hard disk not mounting.

The timing of this key sequence is essential in properly mounting the disk drive. There is no need to keep the keys pressed once the "happy Macintosh" appears on the screen. At this point, the startup volume has already been chosen and continuing to keep the keys held down past this point may cause further undesired effects.

DOS Compatibility Card: Maximum Amount of Shared RAM (7/95)

Revised: 7/10/95
Security: Everyone

DOS Compatibility Card: Maximum Amount of Shared RAM (7/95)

=====

Article Created: 10 July 1995

TOPIC -----

I have a Power Macintosh DOS Compatibility Card, and I am sharing memory from the Macintosh logic board. How does the PC Setup control panel determine which memory choices to make available?

DISCUSSION -----

Memory allocated in the PC Setup Control Panel is shared in the following increments: 2, 4, 8, 16, 32, and 64 MB. The PC Setup control panel allows you to choose any one of these settings with the following constraints:

- The DOS Compatibility Card can only share up to half of the Macintosh logic board's RAM.
- Based on the one half constraint and the amount of RAM available, the PC Setup offers the next lowest increment.
- Memory sharing only works if no SIMM is installed on the DOS Compatibility Card.

Examples:

RAM Installed on Macintosh Logic Board	PC Setup control Panel Offers
-----	-----
8 MB	2 and 4 MB
16 MB	2, 4, and 8 MB
24 MB	2, 4, and 8 MB
40 MB	2, 4, 8, and 16 MB*

NOTE:

one half of 40 MB is 20 MB and the next lowest increment is 16 MB.

PowerBook Duo Dock Plus: Technical Specifications (12/95)

Revised: 12/13/95
Security: Everyone

PowerBook Duo Dock Plus: Technical Specifications (12/95)

=====

Article Created: 6 July 1995
Article Revised/Updated: 13 December 1995

TOPIC -----

This article contains the technical specifications for the PowerBook Duo Dock Plus.

DISCUSSION -----

Displays Supported

- Most Apple displays, including the Apple Multiple Scan 20 Display
- Physically supports monitors weighing up to 85 lb.
- Most VGA and SVGA monitors with adapter

Video RAM (VRAM)

- 1MB of VRAM standard

Color Depth Support

- Built-in support for 16-bit color. Permits display of thousands of colors on monitors up to 17 inches and 256 colors on 20- and 21-inch monitors

Disk Drives

- Built-in Apple SuperDrive 1.4MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Optional internal hard disk (many capacities available)

Interfaces

- One high-speed Ethernet port

- One Apple Desktop Bus (ADB) port supporting a keyboard, mouse, and other input devices
- Two serial (RS-422) ports for printers, modems, AppleTalk network, and other devices
- One Video-out port for external monitor
- One HDI-30 SCSI port for external hard disks, scanners, CD-ROM drives, and other devices
- One Pass-through port for the optional modem in the PowerBook Duo notebook computer
- Sound-in/sound-out ports
- Two NuBus slots for expansion cards that provide Ethernet, Token Ring, additional video, or other capabilities

Networking

- Serial port for AppleTalk networking

Security

- Key lock prevents removal of PowerBook Duo from the PowerBook Duo Dock Plus
- Slot for cable to secure the Duo Dock Plus to a desk

Electrical Requirements

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 87 W maximum

ADB Power Requirements

- Maximum current draw for all Apple Desktop Bus devices: 500 mA (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25-80 mA

Size and Weight

- Height: 4.8 in. (12.1 cm)
- Width: 12.3 in. (31.1 cm)
- Depth: 16.3 in. (41.3 cm)
- Weight: 13.1 lb. (5.95 kg)
(Note: Weight is greater with internal hard disk installed)

Operating Environment

- Operating temperature: 50° to 95° F (10° to 35° C)
- Storage temperature: 40° to 116° F (-40° to 47° C)
- Relative humidity: 20% to 95% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Article Change History

13 Dec 1995 - Added information about internal built-in Ethernet port.

Power Macintosh 9500: Problems With ATI Display Card (11/95)

Revised: 11/17/95
Security: Everyone

Power Macintosh 9500: Problems With ATI Display Card (11/95)

=====

Article Created: 10 July 1995
Article Reviewed/Updated: 17 November 1995

TOPIC -----

I have a Power Macintosh 9500/120 computer that came with the ATI display card. I have two monitors, a Sony GDM-1932, and a Radius Pressview 21SR. I cannot get either of these monitors to synchronize correctly. Radius has explained that their monitor uses Sync on green. The Sony monitor will sync to other resolutions, but not the 1280x1024.

Is there a difference in the sense codes for this resolution? Is there a way to get the Radius monitor to work with the ATI display card?

I have contacted a few manufacturers of display adapters for Macintosh computers, but they have not been able to help me. They claim the 1280x1024 resolution has not been supported on any Apple Macintosh Computers in the past.

DISCUSSION -----

The ATI display card does not support sync on green, this is why the Radius monitor does not work properly. However, the workaround section of this article provides some level of support for both your monitors. You also need to purchase a BNC to VGA cable for the Radius monitor before you can use the workaround.

Normally, on a Power Macintosh 9500 with the standard display card and a non-Apple display (such as a Sony GDM-1932), you would also need a multiple scan display. This display would have to be able to synchronize to 640 x 480 at 60Hz to set up a higher resolution, such as 1024 x 768. Once the higher resolution was set, you could disconnect the multiscan display and connect the non-Apple display. Then the computer would start using the new video scan rate each time the computer is powered on.

This is because the computer uses sense codes to detect the type of monitor that is connected to it. The computer only starts up at 1280 x 1024 scan rates after you set the Monitors control panel and the settings are stored in PRAM. With no

setup information in PRAM, the computer starts at the best scan rate and resolution for the detected display (usually 640 x 480). If you do not have an Apple display to use for setup, you must use a workaround to set the Monitors control panel to the 60Hz scan rate.

Workaround

=====

Step 1

Using a display adaptor, set the display type to VGA/SVGA. (This is 'G' for the video adaptor from Enhance Cable Technology.) Starting up the Macintosh computer with the display adaptor attached between the display and the Macintosh video port starts by default at 640x480 at 60Hz resolution.

Step 2

Open the Monitors control panel. Normally, the control panel Options button only allows safe operating resolutions.

Step 3

Hold down the Option key on the keyboard when you select the Options button in the Monitors control panel. The options panel also shows unprotected scan rates that the video card supports.

Step 4

You can select the 1280x1024 @ 60Hz scan rate from the list. The video scan rate changes, depending on whether you have selected Rearrange on Close or Rearrange on Restart on the bottom of the Monitors control panel window.

Step 5

If you have selected Rearrange on Close and you select a scan rate currently not supported by an Apple display, you are prompted with a dialog box that asks if the monitor display is correct. The dialog only appears if you select an unprotected scan rate.

If you do not select the OK button within about 10 seconds, the system assumes that you do not have a properly synchronized display and reverts back to the previous scan rate.

Following the above procedure, you should be able to set your display to the 1280 x 1024 at 60Hz resolution and scan rate. Please contact Enhance Cable Technology for additional information.

NOTE:

This article provides some information about a non-Apple product. Apple Computer, Inc. is not responsible for content referring to that product. Please

contact the vendor, Enhance Cable Technology, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Performa with Backup CD: Need to Back Up Hard Drive? (9/95)

Revised: 9/8/95
Security: Everyone

Performa with Backup CD: Need to Back Up Hard Drive? (9/95)

=====

Article Created: 10 July 1995
Article Reviewed/Updated: 8 September 1995

TOPIC -----

My Macintosh Performa computer came with a backup CD with all the software already on it. Do I still have to run Apple Backup to copy my software to floppy disks?

DISCUSSION -----

Everything that came pre-loaded on your Performa computer is included on the Macintosh Performa CD. It is not necessary for you to run the Apple Backup program to back up your pre-loaded software. However, you should still back up your personal files and any other software you add later. This can be done by simply copying files to disks or if they are too large to fit in 1.44 MB segments, use a third party backup utility to backup only designated or modified files.

If at some time you remove software from your computer, you will need to run the Apple Restore program and restore the software. The Apple Restore program includes options for restoring just your System software or all the extra software that came pre-loaded on your hard drive. This will restore all the programs, but will replace them so that there are no duplicate copies on your hard drive. You will not lose any personal files.

Computers that include the Performa Backup CD are:

Macintosh Performa 550 (later versions)
Macintosh Performa 575, 577, 578
Macintosh Performa 630CD, 635CD, 636CD, 637CD, 638CD
Macintosh Performa 5200 series
Macintosh Performa 6110CD, 6112CD, 6115CD, 6116CD, 6118CD, 6200CD, 6216CD, 6218CD, 6220CD, 6230CD

Article Change History:

08 Sep 1995 - Added additional Performa models that include the CD.

AppleShare for Windows: Install Issue w/Ethernet Pro NIC (7/95)

=====

Article Created: 10 July 1995
Article Reviewed/Updated: 20 July 1995

TOPIC -----

I have an Ethernet Pro Network Interface Card and am trying to run Appleshare for Windows. Whenever I launch Appleshare for Windows, I get the message, "AppleTalk Driver was not loaded. Please reinstall AppleShare".

DISCUSSION -----

If the workstation has an Intel Ethernet Pro Network Interface card installed when the Appleshare for Windows installation takes place, the Installer omits a necessary parameter for protocol AARP.

You must edit the NET.CFG file and change the line -
 PROTOCOL AARP ETHERNET_SNAP
to-
 PROTOCOL AARP 80F3 ETHERNET_SNAP

Japanese Language Kit: Subscript Katakana Characters? (7/95)

Revised: 7/10/95
Security: Everyone

Japanese Language Kit: Subscript Katakana Characters? (7/95)

=====

Article Created: 10 July 1995

TOPIC -----

The Japanese written language uses Katakana characters to phonetically spell out many American English words for which there is no Japanese equivalent. Neither Kanji nor Hiragana are used for phonetically translated American English words.

Is there a way to use the Japanese Language Kit to input a subscript vowel behind a Katakana character.

For example, the word 'party' is written phonetically 'pa-tei'. Te is a Katakana character that needs the subscript vowel 'i' behind it to achieve the correct pronunciation.

DISCUSSION -----

As of the date of this article, the Japanese Language Kit does not have the capability to subscript a vowel behind a Katakana character.

You will need to use a word processor application to subscript the character or reduce the size of the font to get the desired effect.

LaserWriter 4/600 PS: Maximum Printable Area (11/95)

Revised: 11/6/95
Security: Everyone

LaserWriter 4/600 PS: Maximum Printable Area (11/95)

Article Created: 10 July 1995
Article Reviewed/Updated: 6 November 1995

TOPIC -----

What are the maximum printable areas for Letter and Legal size paper on the LaserWriter 4/600 PS? Is additional memory required to achieve these results?

DISCUSSION -----

The maximum margins for Letter and Legal paper on the LaserWriter 4/600 are:

Begin_Table

	Letter	Legal/US Legal
Left	.10	.10
Right	.19	.19
Top	.17	.15
Bottom	.13	.13

Maximum
Imageable 8.21 x 10.7 8.21 x 13.72
Area

End_Table

The results are posted in fractions of an inch.

The Laserwriter 4/600 PS does not require additional memory to perform edge-to-edge printing because of the use of Adobe memory booster compression technology which allows printing of complex pages with less memory.

LaserWriter 4/600 PS: Advantages of Increasing Memory (11/95)

=====

Article Created: 10 July 1995
Article Reviewed/Updated: 6 November 1995

TOPIC -----

What are the advantages to adding additional memory to the LaserWriter 4/600?

DISCUSSION -----

Adding memory to the Laserwriter 4/600 has the following advantages:

- More fonts can be downloaded at one time
- More space is available to store the calculations needed for large or complex images
- More space is available for font caching, which maintains recently used fonts in memory for faster access.

Why can I not get the Ecologic module in Berkley System's After Dark 3.0 to work with my Power Macintosh 9500 computer?

DISCUSSION -----

This module in After Dark relies on Apple's Energy Saver software. The Energy Saver software in System 7.5.2 is incompatible with the Power Macintosh 9500 series of computers.

Ecologic module of After Dark 3.0 is compatible with the Energy Saver software in System 7.5.3 or later. You should update your system software with system software updates which can be found at Apple Computer's online software update locations.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Apple CD-ROM drives: Audio CD Playback (7/95)

Revised: 7/24/95
Security: Everyone

Apple CD-ROM drives: Audio CD Playback (7/95)

Article Created: 12 July 1995
Article Reviewed/Updated: 24 July 1995

TOPIC -----

This article addresses many issues regarding the playthrough of audio CDs on Apple CD-ROM drives.

DISCUSSION -----

Question:
Does the processor load affect sound quality of audio CDs?

Answer:
The processor load does not have any effect on the performance of audio CDs.*

Question:
Where is the audio signal generated?

Answer:
The sound for Red Book** audio discs is created by a Digital to Analog converter in the CD-ROM drive.

Question:
How does sound get routed to the speaker on an internal CD-ROM drive?*

Answer:
The internal CD-ROM drives's audio output is connected to the logic board. That circuit is passed through the sound chip, and is then output through the regular sound output architecture. No additional processor load is incurred during the trip through the sound chip.

This analog signal is then passed into the sound chip, converted to digital data, manipulated, converted to an analog signal, and passed directly to the

internal speaker(s) as a monaural signal or to the speaker jack as a stereo signal.

Question:

How does this differ on an external CD-ROM drive?

Answer:

On an external CD-ROM drive, the sound signal is routed to the RCA jacks on the back of the drive and to the stereo headphone jack on the front of the drive. This signal can then be connected to the sound input jack on the Macintosh for playback on the internal speaker(s), provided that the computer involved supports playthrough from the microphone port. The microphone input jack then goes into the same sound chip for processing.

Question:

What software components can affect an audio CD performance issue, such as a skipping CD?

If the regular CD-ROM Setup software, Foreign File Access extension, Audio CD Access or their dependent preferences are corrupted, then sound quality could be compromised or altogether stopped.

Question:

Can the use (or non-use) of QuickTime, QuickTime PowerPlug, MultiMedia Tuner, Sound Manager, the Sound control panel, or virtual memory make a difference in the quality of audio CD playthrough?

Answer:

No, because those software components and variables do not have a function in audio CD-ROM playback. If affecting one of these variables does make a difference, they are suppressing a symptom, not correcting it.

Question:

How does the AppleCD Audio Player command the CD-ROM drive to play a track?

Answer:

AppleCD Audio Player reads the "Red Book" audio tracks and knows where tracks begin and end, how long they are and all the available information about the track. It will command the CD to either play the entire content of the CD, or the AppleCD Audio Player software can be configured to play specific tracks.

Question:

What troubleshooting steps are recommended, to rectify erratic audio CD sound?

Answer:

Once verifying that it is an issue with audio CD playback, follow these steps for troubleshooting::

Step 1

Clean the CD. Use a lint-free cloth, sweeping from the hub of the CD, outwards.

Step 2

Try repeating the issue by using multiple CDs.

Step 3

Move these preferences out of the System Folder, and restart.

- AppleCD Audio Player Prefs
- CD Remote Programs
- Sound Preferences

Note: CD Remote Programs contains AppleCD Audio Player's default programs, such as CD titles, track names, and so on.

Step 4

Re-install the system software.

Step 5

Clean install.

Notes:

*The Macintosh Quadra 840AV and 660AV computers use the DSP (Digital Signal Processor) to digitize audio from the CD player, which is then sent to the DAC (Digital-to-Analog Converter) to create analog audio. This causes a slight processor load on the main processor and may affect playback.

**The Red Book specification is for digital audio CDs. All audio CDs use this specification to assure that any audio CD-ROM in the world works with any audio CD-player. The Red Book specification was developed by Phillips and Sony.

Energy Saving Control Panels: Description & Compatibility 10/96

Revised: 2/17/97
Security: Everyone

Energy Saving Control Panels: Description & Compatibility 10/96

Article Created: 10 July 1995
Article Reviewed/Updated: 1 October 1996

TOPIC -----

What is the difference between all the different energy-saving control panels, and how do I know when to use them?

DISCUSSION -----

Energy Related Control Panels Overview

There are four different energy-related control panels in System 7.5.

- Auto Power On/Off: Turns the computer ON and OFF at specified times.
- CPU Energy Saver: Turns the computer OFF at specified times, but not ON.
- Energy Saver 1.0: Puts an external monitor into energy-saving mode.
- Screen: Puts an internal monitor into energy-saving mode.
- Energy Saver 2.0: Combines functionality of CPU Energy Saver, Energy Saver 1.0, and Auto Power On/Off. Energy Saver 2.0 is compatible only on PCI-based Power Macintosh computers, which includes the Power Macintosh 5400, 6400, 7200, 7500, 7600, 8500, and 9500 series computers.

These control panels only work on certain Macintosh computers. In addition, the Energy Saver 1.0 control panel requires an Energy Star-compliant monitor as well as a Macintosh computer compatible with this software. See the chart at the end of this article for a list of compatible systems.

Although many Energy Saver control panels are compatible with many Macintosh Performa computers, not all Energy Saver control panels are bundled with

Macintosh Performa computers. Many Macintosh Performa computers include modems and MegaPhone software, which allow you to use your computer as an answering machine. If you have installed Auto Power On/Off, it is possible for your computer to be inadvertently shut down while your computer is set to answer phone messages. To avoid this, Macintosh Performa computers do not ship with the Auto Power On/Off control panel.

None of the energy-related control panels mentioned here are supported on PowerBook or PowerBook Duo products.

Auto Power On/Off

This feature lets you set your Macintosh computer to power ON and OFF at a pre-determined time, on a daily basis, or for one particular day. It also has a check box labelled "Automatically restart after power failure". If you check this box and the power goes off, the computer automatically restarts. You can use the Auto Power On/Off feature in conjunction with other System 7.5 features. For example, you could set your system to power on at night and run an AppleScript that re-indexes all of your database files or backs up your hard drive.

This control panel can only be used on computers that can be turned off by using the Shut Down command (soft power off) and that have the "Cuda" ADB controller chip or a version of the Motorola 68HC05 microcontroller chip. The chart at the end of this article lists the Macintosh models this control panel is compatible with.

NOTE: Not included with all system software prior to System 7.5

CPU Energy Saver

This feature lets you set your Macintosh to turn OFF at a specified time. However, you cannot set your system to turn ON with this feature. It can only be used on computers that can be turned off by using the Shut Down command (soft power off), such as the Quadra 700. This feature is only installed by System 7.5 if Auto Power On/Off is NOT compatible with the Macintosh and CPU Energy Saver IS compatible with the Macintosh.

NOTE: This control panel did not ship with system software older than System 7.5, although it was released separately before System 7.5.

Energy Saver 1.0

This feature lets you set your Macintosh to put external monitors into sleep mode. It was originally designed to work with the built-in video of Macintosh LC III, Quadra 610-950, Power Macintosh, and Performa 450-467, 63x, 611x.

This feature requires an Energy Star-compliant monitor. Compliant models include:

- Apple Color Plus 14-in. Display
- Macintosh Color Display (newer M1198LL/B version)

- Apple AudioVision 14 Display
- Apple Multiple Scan 14, 15, 17, and 20 Displays

NOTE:

Not included with system software prior to System 7.5, although it was made available separately.

This feature did not come preinstalled on some Performa 630- and 6110-series systems and was not included on the backup CDs that shipped with these systems. Customers who want the Energy Saver software can copy it from the disk that comes with the Multiple Scan 15 Display. (Be sure not to copy the Display Enabler extension, since the Performa 630- and 6110-series systems have the Display Enabler's functionality built into the hardware.)

If Energy Saver is installed on a computer that has an incompatible monitor, the monitor goes black after the specified inactivity period has passed, but the incompatible monitor is NOT in low power mode, and therefore is NOT saving energy. Monitors that do not support this Energy Saver function, or monitors that use video cards, are not harmed by the installation of this control panel, but they do not save energy with Energy Saver installed.

The Energy Saver control panel has a slider bar to adjust the monitor inactivity period, from 15 to 60 minutes. Energy Saver can be turned on by clicking the check box nearest the slider bar. The settings take effect immediately; you do not need to restart the computer.

When the Apple Energy Star-compliant monitor has been inactive (that is, you have not used the mouse or keyboard) for the time specified in the Energy Saver control panel, the screen of the monitor goes black. This indicates that the monitor is in low-power mode, and is saving energy. The computer is still functioning.

The monitor returns to a fully active state approximately 20 seconds after you use the keyboard or mouse. You hear a number of beeps while the screen is updated to reflect its current state. (The beep volume cannot be adjusted; it is independent of all system sound controls.)

Screen

This control panel lets you set your Macintosh computer to put internal monitors into sleep mode.

The Screen control panel can only be used on certain "all-in-one" Macintosh systems, such as the LC/Performa 500-series.

This feature shipped with some Performa 630-series systems and appears to work, but does not really save energy. The Screen control panel should be removed from these systems. Use the Energy Saver control panel in its place.

Energy Saver 2.0

This control panel combines functionality of CPU Energy Saver, Energy Saver 1.0, and Auto Power On/Off. Energy Saver 2.0 is compatible only on PCI-based Power

Macintosh computers, which includes the Power Macintosh 5400, 7200, 7500, 7600, 8500, and 9500 series computers.

NOTE: Energy Saver 2.0 is available only in System 7.5.2 or later when used on a PCI-based Power Macintosh computer.

Power Macintosh:Interleaving & DIMM Population Guidelines (7/96)

Revised: 7/13/96
Security: Everyone

Power Macintosh:Interleaving & DIMM Population Guidelines (7/96)

Article Created: 10 July 1995
Article Reviewed/Updated: 13 July 1996

TOPIC -----

How do I populate DIMMs in my PCI-based Power Macintosh Computer to maximize performance using memory interleaving? If I have an odd number of DIMMS, where should I place the odd DIMM to get the best performance from memory interleaving?

DISCUSSION -----

Memory interleaving is accomplished by 'pairing' two DIMMs in corresponding slots. That is, one DIMM in A1, and another DIMM in B1 will set the machine up to use memory interleaving.

If you have an odd number of DIMMs, the matched pairs will run the memory interleaved. The odd DIMM will then run non-interleaved. For the interleaving to be most effective, the DIMMs must be the same size and speed, (usually, should be of the same manufacturer, but not necessary). In reference to the memory addressing, the A1/B1 will be the lower addresses, going up to the A6/B6 being the highest address.

In relation to performance, it really does not matter where the DIMMs are placed. The software is intelligent enough to figure out which banks are being used, and is able to "stitch" the memory together as required.

Note:

Memory interleaving is only available in the Power Macintosh 7500, 7600, 8500, and 9500 series computers. The Power Macintosh 7200 uses a different memory controller which does not support interleaving.

PowerBook 500 Series: Slow External Mouse (9/95)

Revised: 9/26/95
Security: Everyone

PowerBook 500 Series: Slow External Mouse (9/95)

Article Created: 10 July 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

When I connect an external mouse to my PowerBook 540c the mouse tracks very slowly. When I open the Mouse control panel it shows it is set to Fast. Sometimes when I select Fast in the Mouse control panel and it will track fast. I usually plug my external mouse in when I'm tired of using the built in Trackpad. Why does this happen?

DISCUSSION -----

It is very important that you do not plug the mouse into the ADB port when the computer is "powered on". This may damage the ADB port or mouse. However, it is safe to plug in the ADB device when the Macintosh PowerBook 540c is in the sleep mode.

Plugging in a mouse device on any Macintosh computer while the unit is powered on can result in slow mouse (cursor) movement and possible damage to the ADB port. In addition, the Macintosh PowerBook 500 series computers have two control panels influencing the speed of movement of the cursor: the Trackpad and Mouse. Their settings are related to each other. When you make a change in the Trackpad control panel, the Mouse control Panel also changes.

Check to make sure the Trackpad and Mouse control panels are set to the same speed. Open the Mouse control panel and click on the speed you want, even if the speed is already selected. By clicking on the speed you will be sure to save that setting. Do the same for the Trackpad control panel.

Color LaserWriter 12/600 PS: Intermittent Printing (9/95)

Revised: 9/18/95
Security: Everyone

Color LaserWriter 12/600 PS: Intermittent Printing (9/95)

Article Created: 10 July 1995
Article Reviewed/Updated: 18 September 1995

TOPIC -----

The technical specifications for the Color LaserWriter 12/600 PS listed in Appendix A of the user's manual state that the photosensitive drum life expectancy is:

- 40,000 pages in black and white or 10,000 pages in color, continuous printing.
- 13,000 pages in black and white or 6,500 pages in color, intermittent printing.

What is intermittent printing?

DISCUSSION -----

Intermittent printing occurs when the printer receives a job after it has entered sleep mode. When the printer wakes from sleep mode, it performs a warm-up sequence. During the warm up sequence, the transfer drum and photosensitive drum are both rotated several times creating friction between the two. This friction causes wear on the photosensitive material causing the photosensitive drum to eventually wear out. Thus, life expectancy of the photosensitive drum is determined by the thickness of the photosensitive material, which is reduced very slightly every time the printer warms up.

One method for monitoring the effectiveness of the photoconductor is to print the startup and demonstration pages after a new photoconductor is installed and record the current date and page count on the top of the page. Compare the original print samples with those printed later on to determine whether the photoconductor should be replaced.

Performa 6200CD Series: Specifications (4/97)

Revised: 5/2/97
Security: Everyone

Performa 6200CD Series: Specifications (4/97)

=====

Article Created: 11 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article gives the technical specifications for the Performa 6200 series computers.

The following computers are in the Macintosh Performa 6200 series: Performa 6200, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

These products differ in several ways:

- Amount of RAM installed
- Video In Card installed
- TV Tuner Card installed
- MPEG Card installed
- Application software installed

DISCUSSION -----

Microprocessor

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus

Memory

- 8 MB or 16 MB RAM (one or two 8 MB SIMMs installed)*
- Expandable up to 64 MB (32 MB x 2 slots)
- Two 72-pin SIMM slots, 80 ns or faster
- Expandable one SIMM at a time
- 32-bit memory bus
- 4 MB ROM on 64-bit PPC bus

Storage

- 1.4 MB Apple SuperDrive disk drive - read and write MS-DOS disks
- 1 GB IDE hard drive, 1/3 height
- AppleCD 600i CD-ROM drive (Quad Speed)

Expansion & Ports

- LC processor direct slot (MPEG card installed in the Macintosh Performa 6230CD)
- Video-in slot for optional video capture card (installed in the Macintosh Performa 6220CD and 6230CD)
- TV tuner slot (installed in the Macintosh Performa 6220CD)
- Communications slot (internal modem installed in entire Performa 6200 series)
- SCSI interface for connecting up to five external devices
- One serial (RS-232/RS-422) printer port**
- ADB port
- Sound-in (PlainTalk compatible)
- Sound-out

Video

- 1 MB DRAM video frame buffer
- 16-bit color at 640x480, 8-bit color at 800x600, 832x624
- Supports Video In with optional card
- Apple Multiple Scan 15 Display included with Macintosh Performa 6200CD, 6218CD, and 6230CD

Sound

- 16-bit CD audio
- 16-bit sound out and internal***
- PlainTalk (or line level) microphone required

Communications

- Internal Global Village Communications Teleport Gold IIv 14.4 Kbps fax send/receive modem (installed in Communications slot)
- Megaphone software, speaker phone and digital answering machine

Ergonomic Features

- Front controls for volume and contrast
- Front headphone jack
- Infrared remote control
- Power on/off from keyboard

Keyboard

- Includes AppleDesign Keyboard
- Supports all Apple Desktop Bus (ADB) keyboards

Mouse

- Apple Desktop Mouse 11

Clock/Calendar

- CMOS customer chip and battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Electrical Requirements

- 110 - 240v, 50 - 60 Hz
- Power consumption 45 watts max (excluding monitor)
- EPA Energy Star compliant

ADB Power Requirements

- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA
- Keyboard draws 10mA

Size and Weight

- Height: 4.3 in. (10.95 cm)
- Width: 12.6 in. (32 cm)
- Depth: 16.5 in. (41.95 cm)
- Weight: 19 lb. (8.6 kg)

Operating Environment

- 10°C to 40° C (50°F to 104°F)

System Software

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

Macintosh Performa 6200 Series: Description (4/97)

Article Created: 11 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article provides a description of the Macintosh Performa 6200 series computers.

The following computers are in the Macintosh Performa 6200 series: Performa 6200, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

DISCUSSION -----

Overview

The Apple Macintosh Performa 6200CD computer brings multimedia to life in a modular system that is easy to set up. With its PowerPC processor technology, it offers high performance now, yet can grow with your multimedia and general computing needs for years to come.

Packed in one box are the computer (with Apple's System 7.5 operating software already loaded), a color display, a keyboard, and a mouse. In addition, the Performa 6200CD comes with a variety of home, education, and home-business programs, plus CD multimedia titles—just a sampling of the thousands of Macintosh applications the computer can run. Like all Macintosh computers, the Performa 6200CD is very easy to set up, learn, and use.

This affordable system includes features that are expensive add-ons with other computers. A quadruple-speed CD-ROM drive accesses CD-based data quickly. Stereo 16-bit sound provides high-quality playback from audio CDs. An internal 14.4 Kbps fax send/receive modem also functions as a speakerphone and digital answering machine. An audio-input port lets you record your own sounds. And AppleTalk networking gives you easy access to printers, electronic-mail servers, and file servers.

Every Performa 6200CD system also offers advanced multimedia expansion options.

With a video-in card, you can connect to an external video source such as a VCR or cam-corder to capture video images and use them in your Macintosh applications. A video-out interface box lets you connect the computer to a large-screen TV for presentations. The optional internal TV tuner shows television channels in a window on your computer's display. An MPEG (Motion Picture Experts Group) provides full-motion, VHS quality playback from CD-ROM drives.

The Macintosh Performa 6200CD computer, with its wealth of ready-to-use features and software, adds up to an expandable, flexible multimedia system.

Power and speed

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus

Memory

- 8 MB or 16 MB RAM expandable up to 64 MB

Display

- 1 MB DRAM video frame buffer
- 16-bit color at 640x480, 8-bit color at 800x600, 832x624

Expansion

- Comes with built-in ports for hard drives, printers, scanners, and modems
- Supports most processor-direct cards compatible with Macintosh Quadra 605 and Macintosh LC series of computers via an internal expansion slot
- Includes a communications slot with a 14.4 Kbps fax send/receive Global Village IIv modem installed
- Has video slot for NTSC, PAL, and SECAM video-input card
- Includes expansion bay for television tuner
- External drop box provides expansion for NTSC or PAL video output

Audio System

- Stereo 16-bit sound capable of driving stereo headphones or other stereo equipment through the sound jacks
- Stereo 16-bit CD playback
- One sound-in port
- Front and rear headphone jacks

System Software

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

Open Transport: Duplicate IP Address on Network (10/96)

=====

Article Created: 11 July 1995
Article Reviewed/Updated: 29 October 1996

TOPIC -----

I have a new Power Macintosh 9500 and I have been unsuccessful in determining an IP Address for the Power Macintosh 9500. I used a piece of software that allows me to assign an IP address to machines on my network to paste an address from a Centris 610 to my Power Macintosh 9500.

I have been successful in downloading files from the Internet to both machines with the same address on the same sub-node simultaneously.

How is this possible?

DISCUSSION -----

You should never have two machines on the same network with the same IP Address. You may encounter trouble with lost packets and dropped connections later on if you continue to use your machine in this configuration.

Normally, if any computer has the same IP Address as a host on the network the host will shutdown the connection. The first release of Open Transport in System 7.5.2 did not check to see if there was a duplicate IP Address and therefore will not present you with a warning or dialog that this condition exists.

This issue has been resolved, you should update to Open Transport 1.1.

StyleWriter 1200: Freezes When Printing Arabic or Hebrew (5/96)

Revised: 5/23/96
Security: Everyone

StyleWriter 1200: Freezes When Printing Arabic or Hebrew (5/96)

Article Created: 7 July 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

I have been using Macintosh computers with both U.S. System 7.1 and System 7.5 and the resources for Arabic and Hebrew for some time without a problem. After purchasing and installing an Apple StyleWriter 1200, whenever I print, the computer seems to hang several seconds after the print dialog closes. The problem occurs even when I try "Print Window" in System 7.1 or "Print Desktop" in System 7.5. Is there something wrong with my printer?

DISCUSSION -----

If you are using a StyleWriter 1200 and WorldScript I with Arabic or Hebrew resources, you may notice the following problem: Whenever you attempt to print, the computer seems to hang for several seconds after the print dialog closes. This happens when you try to Print Window (in System 7.1) or Print Desktop (in System 7.5).

This problem is caused by a known conflict between the WorldScript I software and StyleWriter 1200 v.2.0 software. Printing with the StyleWriter 1200 v2.0 printer driver freezes your 1-byte international system a few seconds after the print dialog box closes.

Your system becomes a 1-byte international system when you install the secondary language resources. These resources include the WorldScript I software. The system does not freeze when printing if WorldScript I is not installed, but then you will not be able to see or print Arabic or Hebrew properly. Only the Arabic and Hebrew Language Kits are affected by this conflict.

The problem was fixed in the StyleWriter 1200 v2.1 and also in the Color StyleWriter 2400 v2.1 software which are both available from online services.

System 7.5: Easy Open, Translators and Desktop Rebuild (8/95)

Article Created: 11 July 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

I am running At Ease 3.0 and System 7.5.1 on my Macintosh LC 575. I recently upgraded to ClarisWorks 4.0. I have a WriteNow file that ClarisWorks 3.0 used to translate perfectly whenever I double-clicked the file. Now when I double-click a WriteNow, or any other file that ClarisWorks previously was able to translate, I get a message stating that ClarisWorks could not find the appropriate translators. When I look in my System Folder, all the translator files are in the ClarisWorks Translators folder within the Claris folder.

DISCUSSION -----

The issue you are experiencing here is not related to At Ease or the newer version of ClarisWorks. You can test this by turning off At Ease using the At Ease Setup application and restarting. If the same failure occurs, then you have ruled out At Ease interfering with ClarisWorks' translators.

Since the ClarisWorks Translators folder has all the necessary translation files available, the issue is related to access and interaction with those files.

System 7.5 includes a control panel called Macintosh Easy Open (MEO), which builds a table of file types, applications, and the translators available to those applications that give them the ability to open different file types. When you double-click a file, the Finder checks with MEO to see what application it should use to launch, or perhaps translate, a file.

Since you installed the new version of ClarisWorks, MEO now needs to update this table. This can be done by rebuilding the Desktop file of your Macintosh in the following way:

Step 1

Make sure you have turned off At Ease using the At Ease Setup program.

Step 2

Restart your Macintosh and hold down the Space Bar until the Extensions Manager control panel opens.

Step 3

Use the pull down menu in the Extensions Manager to choose "All Off"

Step 4

Scroll down to the Control Panels section of the Extensions Manager window and click the Macintosh Easy Open item to put a check mark by it.

Step 5

Close the Extensions Manager window by clicking on the close box in the upper left corner.

Step 6

Immediately hold down the Command (Apple) and Option keys until you see the dialog box, "Are you sure you want to rebuild the desktop file?"

Step 7

Click Okay.

After the desktop rebuilds you can test to see if you have been successful by double clicking the file in question. Once you have determined everything is working normally, you can go back to the Extensions Manager and turn on all the extensions you usually use including At Ease. You need to restart to have the reactivated extensions load.

It is a good idea to rebuild the desktop file this way after installing any new software.

Desktop PrintMonitor: Cannot Disable Manual Feed Dialog (6/96)

Revised: 6/24/96
Security: Everyone

Desktop PrintMonitor: Cannot Disable Manual Feed Dialog (6/96)

=====

Article Created: 11 July 1995
Article Reviewed/Updated: 24 June 1996

TOPIC -----

I have recently installed the software for my Apple StyleWriter 1200 Printer with its new Desktop Printer software components. Is there a way for me to turn off the dialog warning that appears when I start a manual feed print job like I was able to do in previous versions of PrintMonitor?

DISCUSSION -----

The desktop printing software is included with the LaserWriter 8.3 driver. The software is also included in the original disk sets of the StyleWriter 1200, 1500, and 2xxx printers.

The version of Desktop Printing software you are using will determine how you turn this manual alert feature off. The latest version of the Desktop Printer software is available from online services.

If you have Desktop Printing software prior to version 1.0.3, you must use an older version of the PrintMonitor. First you must turn off the Desktop PrintMonitor through the Extensions manager or remove the desktop printer software. To remove the desktop printer software, refer to the Read Me file for your printer. The ReadMe file will also define the steps necessary to use the older PrintMonitor.

If you have Desktop Printing Software version 1.0.3 or later, it is set up to notify you about manually feeding paper the same way your PrintMonitor was set. For example, if you turned off notification for manual feeding in your PrintMonitor, the Desktop PrintMonitor will also have manual feed notification turned off.

You can change how the Desktop PrintMonitor notifies you about manual feeding, by following this procedure:

Step 1

Hold down the Shift key and restart your computer, keeping the Shift key depressed until the message "Extensions off" or your normal desktop appears.

Step 2

Open your System Folder and then open your Extensions folder.

Step 3

Double-click the PrintMonitor application.

Step 4

Choose Preferences from the File menu.

Step 5

Select your manual feed option and click OK.

Step 6

Close the PrintMonitor.

Step 7

Restart your computer.

MAE 2.0: Serial Port Commtoolbox Not Supported (7/95)

=====

Article Created: 11 July 1995

TOPIC -----

I am running the Macintosh Application Environment (MAE) 2.0 on a Sun Sparcstation (Solaris). When I try to run the Newton Connection Kit via the serial port I get a "Commtoolbox cannot be found" error.

DISCUSSION -----

The current version of MAE 2.0 does not support serial port communication on the Unix workstation (Sun or HP). The commtoolbox or Newton Connection/Tool Kit were not fully tested to work in MAE.

Serial port support has been on the feature request list of future MAE releases.

Power Macintosh: Native Excel Libraries Not Loading (7/95)

=====

Article Created: 11 July 1995
Article Reviewed/Updated: 24 July 1995

TOPIC -----

When I try to launch the PowerPC native version of Excel, the Power Macintosh displays an error message stating that a certain library cannot be found. All the Microsoft files are installed but I still get the message. What is wrong?

DISCUSSION -----

The error message is somewhat misleading because the problem Microsoft Excel is having when launching is due to running out of RAM. On a 16 MB Power Macintosh running System 7.5 and Excel for Power Macintosh, there is not enough RAM to load all of the libraries that Excel requires. When the Code Fragment Manager tries to load the libraries, the load fails due to lack of RAM, and the Code Fragment Manager reports the library cannot be found.

One solution is to turn on Virtual Memory (VM) in the Memory control panel to at least 17 MB total. The Get Info window for Excel states the application requires 9300 KB RAM when not using VM. However, the libraries make up the other 4 MB of the RAM requirement when not using VM. Virtual memory starts file-mapping, which lowers the memory requirement for Excel from about 13 MB to about 4 MB.

Another solution is to add more physical RAM to the Power Macintosh.

Open Transport: LocalTalk in Appletalk Panel (8/95)

=====

Article Created: 11 July 1995
Article Reviewed/Updated: 22 August 1995

TOPIC -----

I have a new Power Macintosh 9500 computer. In the AppleTalk control panel under "Connect via", I have an option for "LocalTalk" in addition to "Ethernet", "Printer port", and "Modem port". Where did that come from?

DISCUSSION -----

You have installed the Apple Internet Router software, which is not compatible with the new Open Transport software in System 7.5.2.

Remove the "Router", "LocalTalk (Built-in)", and "LocalTalk (Modem)" files from your Extensions folder and restart you Power Macintosh.

Simpletext 1.2: Cursor prints on QuickDraw Printers (5/96)

=====

Article Created: 11 July 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

When I print from SimpleText 1.2, the cursor prints out also. This happens when I print to my Apple StyleWriter Printer but not my LaserWriter Pro 630.

Is this a bug with my Apple StyleWriter Printer?

DISCUSSION -----

This is a known issue with SimpleText 1.2 and QuickDraw printers. This problem has been corrected in SimpleText 1.3. This version of SimpleText began shipping with QuickDraw 3D and is available on several online services.

Pwr Mac 9500 Series: Incompatible w/ Newton Toolkit (10/95)

=====

Article Created: 12 July 1995
Article Reviewed/Updated: 30 October 1995

TOPIC -----

This article discusses compatibility between the Newton Toolkit and Power Macintosh 9500 computers.

DISCUSSION -----

The Newton Toolkit v1.0.1 and v1.5.1 are not compatible with Power Macintosh 9500 computers. There is an updater available from online services and the Internet which updates the Newton Toolkit to a beta version of 1.5.2. Newton Toolkit is a Newton software development program available through Apple Programmers and Developers Association (APDA).

In addition to the update, the latest System Enabler is needed on the Power Macintosh 9500. This enabler can be found on v2.0 of the Power Macintosh 9500 compact disc. Open Transport v1.0.6 and later also installs the latest System Enabler.

SYMPTOM: Error Message - "Could Not Obtain Required Resource" when opening the Newton Toolkit Application.

SOLUTION: Updated Power Macintosh 9500 Enabler and Newton Toolkit.

SYMPTOM: Newton Toolkit Application crashes without an error.

SOLUTION: Updated Power Macintosh 9500 Enabler and Newton Toolkit.

Article Change History:

30 Oct 1995 - Added information on obtaining new version of Toolkit.

The design of some memory SIMMs do not permit the DOS Compatibility Card to utilize the full capacity of the memory."

What type of SIMMs should be used in order to fully utilize the capacity of the memory?

DISCUSSION -----

Non-composite SIMMs can be fully utilized. The DOS Compatibility Card uses 72-pin, 80 ns or faster, non-composite SIMMs. Thus, if the correct SIMMs are used, the DOS Compatibility Card should be able to utilize the full capacity of the memory.

Apple SIMMs are non-composite. Contact the manufacturer or vendor of the SIMM to determine whether any added SIMMs are composite or non-composite.

Apple MessagePad: Flash RAM Cards Do Not Completely Erase (9/95)

=====

Article Created: 12 July 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

When I erase a 2 MB flash RAM card in my Apple MessagePad, there is 2k in use and 1865k free. What happened to the rest of the 2 MB of RAM?

DISCUSSION -----

The RAM loss is caused by the nature of flash RAM.

Flash RAM is allocated in blocks, and unlike static RAM, flash RAM cannot be erased. Instead, if you want to erase a bit in a block of flash RAM, the entire block minus the bit must be copied to another block of flash RAM. Thus, there must always be at least one block of free flash RAM at all times.

The Apple MessagePad actually keeps a few blocks free for performance reasons. These free blocks account for the missing RAM.

Macintosh Performa 5200CD Series: Specifications (4/97)

Revised: 4/29/97
Security: Everyone

Macintosh Performa 5200CD Series: Specifications (4/97)

Article Created: 12 July 1995
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article gives the technical specifications for the Macintosh Performa 5200 series computers.

The following computers are in the Macintosh Performa 5200 series: Performa 5200 and Performa 5215. The Performa 5215 Canadian-French software bundle is also provided.

DISCUSSION -----

Microprocessor

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus
- Bus speed is 37.5 MHz. (processor speed/2)

Memory

- 8 MB (one 8 MB SIMMs installed)
- Expandable up to 64 MB (32 MB x 2 slots)
- Two 72-pin SIMM slots, 80 ns or faster
- Expandable one SIMM at a time (do not have to be similar density)
- 32-bit memory bus
- 1 MB DRAM frame buffer (separate from RAM) for video memory, not expandable
- 4 MB ROM on 64-bit PPC bus

Form Factor

- All in one enclosure
- Tilt from - 5° to +15°, Swivel 360°
- Front controls for volume and contrast
- Front headphone jack

- Infrared remote control
- Single power plug for system
- Power on/off from keyboard

Storage

- 1.4 MB Apple SuperDrive disk drive - read and write MS-DOS disks
- 790 MB or 1 GB IDE hard drive, 1/3 height*
- AppleCD 600i CD-ROM drive (Quad Speed)

Video Display

- 15" flat square shadow mask CRT
- .28 mm dot pitch
- User adjustable resolutions from 640x480 (63 DPI) to 832x624 (81 DPI) without restarting
- Refresh rate up to 75 Hz
- Low emissions (ELF, VLF)

Video Resolutions

Begin_Table

Resolution	Max. Bit Depth	Max. Number of Colors
-----	-----	-----
640 x 480	16	32,768
800 x 600	8	256
832 x 624	8	256

End_Table

Interfaces

- LC processor direct slot
- Video-in slot for optional video capture card
- TV tuner slot
- Communications slot (internal modem installed in entire Performa 5200 series)
- SCSI interface for connecting up to five external devices
- One serial (RS-232/RS-422) printer port**
- ADB port
- Sound-in (requires PlainTalk microphone)
- Sound-out
- Apple External Video Connector (M4099LL/A)
 - Purchased separately from the computer itself, this internal cable allows you to connect a Macintosh compatible display externally for video mirroring functionality.

Sound

- Integrated stereo speakers
- Built-in microphone
- 16-bit CD audio, 16-bit sound

Communications

- Internal Global Village Communications Teleport Gold IIv 14.4 bps fax send/receive modem (installed in Communications slot)
- Megaphone software, speaker phone and digital answering machine

Keyboard

- Includes AppleDesign keyboard
- Supports all Apple Desktop Bus (ADB) keyboards

Mouse

- Apple Desktop Mouse 11

Clock/Calendar

- CMOS customer chip and battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Electrical Requirements

- 110 - 240v, 50 - 60 Hz
- Power consumption 125 watts
- EPA Energy Star compliant

ADB Power Requirements

- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA
- Keyboard draws 10mA

Size and Weight

- Height: 17.5 in. (44.5 cm)
- Width: 15.1 in. (38.3 cm)
- Depth: 16.0 in. (40.6 cm)
- Weight: 47 lb. (21.15 kg)

Operating Environment

- 10°C to 40° C (50°F to 104°F)

System Software Requirements

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

Third-party software bundles

MAE: Problems Using MS-DOS or Solaris Disks (7/95)

Article Created: 12 July 1995

TOPIC -----

I am having difficulty mounting or reformatting MS-DOS or Solaris disks on my Sun Workstation running MAE.

DISCUSSION -----

If you insert a floppy disk formatted for MS-DOS or Solaris into a Sun workstation and try to mount it in MAE by clicking the Mount Floppy/CD button, MAE displays an alert box. The alert box appears because the Solaris file manager mounts the floppy disk before MAE has the opportunity to mount it preventing MAE from accessing the floppy disk. The icon for the floppy disk appears on your Solaris desktop. You can not reformat MS-DOS disks as Macintosh disks, and can not use them on the MAE desktop.

You have several options for dealing with this situation:

- If you want to use the files on the disk, the contents of the disk will show up as UNIX files in /floppy in your Solaris file system.
- If you do not want to use the files on the disk, and you want to format it as a Macintosh disk, you can eject the disk, insert it into a Macintosh computer, and reformat it as a Macintosh disk.
- If you do not want to use the files on the disk, and you want to format it as a UNIX disk, you can try to reformat the disk on a UNIX workstation that is not running the Solaris File Manager.

PowerBook 500 Series: Global Village 2.5/PCMCIA Conflict (5/96)

Revised: 5/13/96
Security: Everyone

PowerBook 500 Series: Global Village 2.5/PCMCIA Conflict (5/96)

Article Created: 28 June 1995
Article Reviewed/Updated: 13 May 1996

TOPIC -----

I have a PowerBook 500 series computer. I just installed the Global Village PowerPort 2.5 for 500 & Duo software. Since I installed this software I have been getting a -29 error during startup and the PowerPort software has not been loading. This only happens when I have the PCMCIA Expansion Module installed. It happens even if the PCMCIA cage is empty. What is wrong?

DISCUSSION -----

This issue is caused by lack of memory available for the PCMCIA Expansion Module drivers when they load during startup. Installing Network Software Installer (NSI) 1.5 corrects the problem. NSI 1.5 causes the drivers to load differently. After you install NSI 1.5 the conflict will no longer occur.

You should also install the latest version of the Global Village software for the PowerBook 500 & 2300 series (PP500Duo 2.5.5) It can be downloaded from the WWW at FTP.globalvillage.com/pub/software/mac/.

These articles can help you locate the NSI 1.5 software update mentioned here:

- "Where To Find Apple Software Updates"
Lists online services for "free" Apple software updates.
- "Obtaining Apple Product Support in the USA"
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

PowerBook 200 Series: Type III Battery and System 7.5.1 (9/95)

Revised: 9/26/95
Security: Everyone

PowerBook 200 Series: Type III Battery and System 7.5.1 (9/95)

=====

Article Created: 22 June 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

I have a Macintosh PowerBook Duo (200 series). Since I installed the System 7.5 Update 1.0, the external recharger gives a red light when I try to charge a Type III battery. This occurs even after following the instructions for loading the proper power management code into the charger. This happened with a brand new battery.

DISCUSSION -----

Resolution

You need to install the Type III battery extension into the System folder. Do not remove this extension even after you have installed System 7.5 and the System 7.5 Update 1.0. The extension is on a disk called Battery Tools, which ships with the Type III battery.

Background

When the System 7.5 Update 1.0 extension loads, it replaces the PG&E (battery management) code. This PG&E code then reloads to the external battery charger. Because of this, the external recharger does not recognize the Type III batteries and you get the red light. However, the batteries charge fine in the computer itself.

Conclusion

You need to use the Type III Battery extension to get the external charger to work with System Software 7.5.1 (System 7.5 plus the System 7.5 Update 1.0) and Type III batteries.

These articles can help you locate the software (Type III Battery extension) mentioned here:

Security: Everyone

Apple HD SC Setup: How to Initialize an Apple Hard Drive (9/95)

Article Created: 10 July 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

This article describes what to do if you run Disk First Aid and it finds a problem, but it says it cannot repair it. Before you decide that you need to reformat your hard drive, there are a few other things to check.

DISCUSSION -----

WARNING! You must back up all of your data before reformatting a hard drive because the formatting process deletes all data.

Verify Your Process
=====

You should first verify that you are running Disk First Aid correctly. You cannot repair the boot volume (the startup disk) with Disk First Aid. In other words, if you are started up from your hard drive, Disk First Aid cannot repair the problems with the hard drive until you restart your Macintosh computer from another startup disk. For Disk First Aid to be able to repair a volume, make sure you are starting up from any one of the following disks:

- The Disk Tools floppy disk which came with your computer
- A bootable floppy disk or CD-ROM which contains your current system software (correct System Enabler) and utility programs
- Any other bootable disk (floppy or hard) from which you can start up your computer and run Disk First Aid

Disk First Aid also cannot repair a disk on which it is located (basically, it cannot repair itself), or any disk on which File Sharing is active.

Run Disk First Aid

=====

Step 1

Start up from the Disk Tools disk or CD-ROM

Step 2

Open the Disk Tools disk or the Apple Macintosh CD. Apple Macintosh CD users should open the Utilities Folder.

Step 3

Double-click the Disk First Aid icon. Select the main hard drive's icon at the top of the Disk First Aid window.

Step 4

Click Verify. Disk First Aid checks your hard disk for any potential problems. If it finds a problem, click Repair. It attempts to fix the problem.

Step 5

When you are finished verifying the hard disk, choose Quit from the File menu to return to the desktop. If you get a message that states that Disk First Aid cannot repair the problems with your hard drive, you should reformat it.

Reformatting Using Apple HD SC Setup

=====

Step 1

Locate the Apple HD SC Setup application icon on the Disk Tools disk or CD-ROM and open it.

Step 2

If the "volume name" or the SCSI ID number shown does not belong to the hard disk you want to initialize, click the Drive button until the hard disk you want to initialize is the selected hard disk. The internal hard drive should be ID 0. Remember, you cannot initialize your current startup disk or the disk on which the Apple HD SC Setup program is located.

Step 3

When the SCSI ID number (and name, if any) of the hard disk you want to initialize is shown, click the Initialize button. A dialog appears in which you must confirm or cancel your decision to erase all the data on the drive.

Step 4

Click the Init button to initialize the hard disk. A message displays to update

you on the initialization process. If a message reports that initialization failed, begin the process again.

Step 5

In the dialog box that appears asking you to name the disk, type in the name you want and click OK.

Step 6

Click Quit when the message reports that initialization was successful.

Step 7

If initialization fails, you should have your hard drive checked by an authorized Apple Service Technician.

Non-Apple Hard Drives

=====

If you have a non-Apple hard drive, you will get a message that says, "Unable to find a suitable SCSI drive". The use of Apple HD SC Setup is supported for Apple hard disk drives only. HD SC Setup does not update the driver software on or reformat non-Apple drives. If you are using a non-Apple hard disk drive, you must use third party formatting software to reformat the drive. If you have a question about a specific third-party hard disk or driver version, contact the vendor.

It is important to note that the hard disk drives sold by Apple in some Macintosh computers have different firmware than the drives sold by various third-party vendors, even though the manufacturer of the mechanisms may be the same.

This firmware contains information that lets HD SC Setup determine the type and size of the drive it is reading. If HD SC Setup does not understand the information in the firmware of a third-party drive, it will not access the drive in any way.

CAUTION: A/UX USERS

=====

If you purchased a hard disk with the A/UX operating system installed on it, DO NOT initialize that disk; doing so erases A/UX. Refer to the instructions that came with the A/UX operating system before you proceed.

Power Macintosh 7200 Series: Using a Microphone Read Me (8/95)

Revised: 8/4/95
Security: Everyone

Power Macintosh 7200 Series: Using a Microphone Read Me (8/95)

Article Created: 13 July 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

This article contains the Using a Microphone ReadMe file for the Power Macintosh 7200 series computers.

DISCUSSION -----

If the sound produced by your microphone is at mic-level, you can use the Sound control panel to turn on microphone amplification.

First you must install the Sound Input Amplification extension. Follow these steps:

Step 1

Drag the Sound Input Amplification icon to the System Folder on your hard disk. Do not open the System Folder.

Step 2

When a message appears asking if you want the file placed in the Extensions folder, click OK.

The amplification type for most standard microphones, which do not include pre-amplifiers, is mic-level. The Apple PlainTalk microphone has a pre-amplifier, and the sound it produces is at line-level. Other sources, such as CD and cassette tape players, also produce sound at line-level. (Refer to the material that came with your microphone if you are not sure whether or not it has a pre-amplifier.)

To choose an amplification type:

Step 1

Open the Sound control panel.

Step 2

Use the pop-up menu to choose Amplification.

Step 3

Click Microphone Amplification On.

Your choice takes effect immediately.

The Apple PlainTalk microphone comes with a pre-amplifier and produces sound at line-level. If you use this microphone, you can leave the Amplification setting at the default setting (Microphone Amplification Off).

For more information about these settings, open the Sound control panel, choose Amplification from the pop-up menu, and turn on Balloon Help.

1995 Apple Computer, Inc. Apple and the Apple logo are trademarks of Apple Computer, Inc., registered in the U.S. and other countries. PlainTalk is a trademark of Apple Computer, Inc.

Power Macintosh 7200 Series: Pointer Mode Read Me (8/95)

=====

Article Created: 13 July 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

This article contains the Pointer Mode Read Me file for the Power Macintosh 7200 series computers.

DISCUSSION -----

Including the Pointer in Screen Captures

If you take a screen shot and the pointer does not appear in the captured graphic, you can use the Pointer Mode control panel to ensure that the screen-capture program includes the pointer.

To install the Pointer Mode control panel, follow these steps:

1. Drag the Pointer Mode control panel icon to the System Folder icon on your hard disk (do not open the System Folder).
2. When a message appears asking if you want the control panel placed in the Control Panels folder, click OK. Your computer recognizes that this is a control panel and automatically places it in the Control Panels folder.

To use the Pointer Mode control panel:

1. Open the Apple menu and choose Control Panels.
2. Double-click the Pointer Mode control panel to open it.
3. Click the checkbox to set the pointer to standard mode.

If you find that the pointer flashes a lot when you place it over graphics, you may want to use the Pointer Mode control panel to turn off standard mode.

Open Transport: Networking Read Me (11/95)

Revised: 1/4/96
Security: Everyone

Open Transport: Networking Read Me (11/95)

Article Created: 13 July 1995
Article Reviewed/Updated: 15 November 1995

TOPIC -----

The following article is the ReadMe file for Open Transport, which is included on the Power Macintosh 7200 and 9500 series computers.

DISCUSSION -----

About Open Transport Networking

MacTCP

If you have problems with TCP/IP application after installing new networking software, open the Control Panels folder and look for the MacTCP control panel. If one is there, remove it from the Control Panels folder and restart your computer. Each time you install new networking software, you may want to verify whether or not the software's installer also installed MacTCP, and follow this procedure.

Application Compatibility Comments

-
- FTPd: Application currently is experiencing sporadic failures with TCP/IP MacTCP compatibility. These failures are rare and generally do not result in loss of data or other problems.
 - MacTCP Watcher, TCP/Connect II, MacTCP Switcher, and Anarchie are applications that are known to be incompatible with Open Transport. Developers are revising their products to be compatible with Open Transport.
 - Timbuktu works only with AppleTalk using Open Transport.
 - Eudora: Open Transport supports commercial version 2.11 and shareware version 1.5.1 of Eudora.

- FileMaker Pro TCP/IP networking throughput is noticeably slower than with classic MacTCP.
- NFS/Share for large file transfers must have a blocksize of 16K or smaller.

TCP/IP LAP (Link Access Protocol) Support Caveats

- Only the following MacTCP Link Access Modules are supported: "InterSLIP", "InterPPP", "InterPPP II", "TCP/IP PPP", "MacSLIP", and "MacPPP".
- Open Transport does not support SLIP and/or PPP connections occurring automatically when the networking application is executed with the currently available MacTCP Link Access Modules (e.g. MacPPP, InterSLIP, InterPPP, MacSlip). SLIP/PPP connections must be started up using the 3rd-party-supplied control panel before running the TCP/IP application.
- InterSLIP: Version 1.0.1 is not compatible with Open Transport, you need a later version. InterCon should be contacted directly.
- InterPPP 1.2.9: May crash when receiving a large graphic file via HTML readers.
- MacSLIP 2.0.6: Connect at System Startup doesn't work.
- MacPPP: MacPPP versions 2.0.1, 2.0.1 cm4, and 2.1 SD exhibit incompatibilities with Open Transport in opening connections. Future versions (e.g. MacPPP 2.2.0) will address this incompatibility. The MacPPP "Open" button does not work; the only way to open a connection is by opening a TCP/IP application. However, Open Transport might time-out before the completion of the connection so that it cannot get the correct IP address from the LAP. After disconnecting MacPPP, you must restart your Macintosh in order to connect again.
- Once a TCP/IP application is opened over a SLIP or PPP LAP, you cannot use another SLIP or PPP LAP without restarting the Macintosh.
- When a SLIP or PPP LAP is selected in the TCP/IP control panel, and "Manually" is selected in the Configure pop-up menu, the value of the IP address entered in this control panel is ignored by Open Transport. If you are assigned a static IP address by your SLIP or PPP provider, you should set it in the LAP configuration program. If your IP address is assigned dynamically, you should configure the LAP configuration program for dynamic addressing.

PowerShare Mail Server

There is a known compatibility problem between Open Transport and version 1.0 of the PowerShare Mail Server. If you set up the PowerTalk Universal Mailbox to read mail on the same machine on which the PowerShare Mail Server is running, the Mail Server may crash some time later, usually on shutdown. The workaround is to use another machine to read mail. This problem will be fixed in PowerShare Collaboration Servers version 1.1.

Tips

====

Apple Personal Diagnostics

To use Apple Personal Diagnostics (APD) on this Power Macintosh computer, you should upgrade to APD v1.1.3 or greater. An upgrade patch for owners of APD v1.1 and APD v1.1.1 is available.

If you run the Logic Board tests in APD v1.1, your computer may freeze and need to be restarted; or APD v1.1 may falsely report a logic board error when none has actually occurred. APD v1.1.1 and v1.1.3 correct these Logic Board test errors. APD v1.1.3 also corrects a reporting error regarding processor speed in the System Info/Basic Info screen.

...Note: This note is not in the original Read Me file.

Apple Personal Diagnostics 1.1.3 is not supported on the Power Macintosh 7200 computer. As of the modification date of this article, the Power Macintosh 9500 is the latest released computer supported by Apple Personal Diagnostics. Apple has no plans to support the Power Macintosh 7200 in future releases of APD....

AppleShare Server Software

We do not recommend using version 4.1 or earlier of AppleShare Server Software on the Power Macintosh 7200 & 9500. Version 4.1 is intended only for Apple

Workgroup Servers, and earlier versions will not work.

Energy Saver Control Panel (Power Macintosh 7200 Only)

Do not remove the Energy Saver extension from the Extensions folder. If you remove it, you cannot turn off any energy-saving features the control panel is currently set to provide, such as automatic sleep or shutdown.

Installing Acrobat Reader Software from the Bootable CD-ROM

When you install Acrobat Reader 2.0.1 software onto your hard drive, make sure that the bootable CD-ROM disk that came with your Power Macintosh is not the startup disk. Then open the appropriate Installer to install Acrobat Reader 2.0.1 software.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your Power Macintosh, make sure you use version 1.2 or later. In the United States, you can obtain an upgrade, with proof of purchase, by calling the Apple Order Center. Customers outside the US should contact their local Apple representative.

To use the Chinese Language Kit with your Power Macintosh, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, first install the WorldScript Updater 1.0. Then install the Chinese Language Kit version 1.1. Finally, install the Chinese Language Kit Updater to update your software to version 1.1.1.

Pointer Mode Control Panel (Power Macintosh 7200 Only)

The Pointer Mode control panel lets you control the way the mouse pointer works with certain types of graphics software and screen capture programs. For more information, read the document titled "Pointer Mode Read Me" in the Pointer Mode folder (inside the Apple Extras folder).

Reconnecting to a Server

If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu once power is restored, you get a message that the disk could not be opened because you do not have enough access privileges. Before you can reconnect to the server, you must close any open files. If you need to save work in a file, use "Save As..." to save it on a different disk.

Software for the GeoPort Telecom Adapter

For Power Macintosh 7200 series, 7500/100, 8500/120, and 9500 series computers, the software necessary to use the GeoPort Telecom Adapter is Apple Telecom software version 2.1 or later. Apple Telecom 2.1 is included in the Apple Telecom folder within the Apple Extras folder, and on the Power Macintosh CD.

The Apple Telecom folder also contains MegaPhone™ 1.0.2, a screen-based telephone application that supports the telephone capabilities of the Apple

Telecom 2.1 software, including dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information.

If you previously purchased the Apple Telecom 2.0 upgrade package or a Geoport Telecom Adapter Kit that included Apple Telecom 2.0, you also received SITcomm SE/GTA (a terminal emulation program). SITcomm is compatible with the Power Macintosh 7200, 7500, 8500, and 9500 series.

If you are using a GeoPort Telecom Adapter with Apple Telecom 2.1 software, be sure to disable LocalTalk. To do this, disconnect any devices attached to the printer port (except serial printers, which can remain attached).

Apple Telecom 2.2 is available as part of the GeoPort Telecom Adapter Kit, which can be purchased separately. The kit includes MegaPhone as well as SITcomm SE/GTA. Apple Telecom 2.2 along with MegaPhone (but without SITcomm) will also be available as a free upgrade on CompuServe, America Online, and all Apple Internet sites.

StyleWriter and StyleWriter II Printers

If you use a StyleWriter or StyleWriter II printer with your Power Macintosh, use the StyleWriter 1200 printer software (called a "printer driver") that's already installed on this computer with System 7.5.2. Do not install your older StyleWriter driver; it is not compatible with Power Macintosh computers. For more information about choosing a printer and printing, choose Macintosh Guide from the Guide (question mark) menu, and choose the Printing & Fonts topic area.

Using a Microphone (Power Macintosh 7200 Only)

If you attach a microphone to your Power Macintosh 7200, read the document titled "Using a Microphone" in the Sound-Input Level folder (inside the Apple Extras folder). This document explains how to use the Sound control panel to choose the amplification type appropriate for your microphone.

Using MIDI Products

MIDI users may experience slight performance issues due to the new serial architecture of this computer. MIDI Drivers written specifically for this new technology are currently being developed which will resolve these issues. Please check with the distributor of your MIDI product about the availability and necessity of an update compatible with the serial architecture of the Power Macintosh 7200 & 9500.

Important Information About Document Auto-Save (Power Macintosh 7200 only)

=====

The Energy Saver control panel that comes installed on the Power Macintosh 7200 contains a feature named "Document Auto-Save". The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Below are some helpful tips for working with Document Auto-Save. For more information about Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide (question mark) menu, and choose the Power & Energy Saving topic area.

Compatibility with Your Applications

Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes that ask the user to save changes to new or modified documents. When an application is incompatible with Document Auto-Save, it will either not automatically quit, or it displays alerts or dialog boxes which Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave no documents open that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel to sleep instead of shutting down when unsaved documents are open.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Applications That Auto-Save

Document Auto-Save performs more quickly and efficiently if you have enabled auto-saving in the applications that support it. For example, Microsoft Word has an option available that will save your changes at pre-determined time intervals. It is recommended that you take advantage of application auto-saving whenever possible.

RAM Disks

Do not choose a folder on a RAM disk for auto-saving untitled documents unless you have installed a product which preserves the RAM disk contents before shutdown. Otherwise, your auto-saved documents will be lost when an idle or scheduled shutdown occurs.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Stickies Windows

If you are using the Document Auto-Save feature of the Energy Saver control panel, and you have any Stickies notes open during an idle or scheduled shutdown, an extra carriage return is inserted in the active (frontmost) Stickies note window. No other Stickies windows will be affected.

Important Information About Macintosh PC Exchange

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with Macintosh PC Exchange and should not be used while PC Exchange is installed. Version 2.0 of PC Exchange contains an easier method for accessing DOS and Apple II ProDOS disks on a Macintosh.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Macintosh, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the Macintosh-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both Macintosh- and DOS-format partitions, PC Exchange will only recognize the Macintosh partition. In addition, PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Macintosh-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Macintosh, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your Macintosh computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize SCSI hard disk drives, you must turn on the drive before you turn on your Macintosh.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

=====

- A "Sad Mac" icon may appear on your Macintosh screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your Macintosh.

- Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory may help you avoid running out of memory.

Your computer comes with virtual memory turned on. With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems (such as your computer's responses seeming unusually slow) using certain application programs, you may want to turn off virtual memory. For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. Then click "How do I use hard disk space as memory?" and "How do I manage Power Macintosh memory?"

For best performance, try setting virtual memory to no more than 150% of the memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive). A maximum of 1 gigabyte (GB) of disk space can be used as virtual memory. If your hard disk has additional disk space available, the amount over 1 GB cannot be used as virtual memory.

To improve performance, you can also add memory (RAM) to your computer. See the user's manual that came with your computer for more information.

Troubleshooting

=====

AppleShare Displays Incorrect Information for Large Drives

If you use File Sharing to connect to a disk attached to another computer, and the shared disk is larger than 2 gigabytes (GB), the Get Info box for that disk shows an incorrect size. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

Incorrect Balloons for Guide File Icons

System 7.5.2 includes Apple Guide documents, which provide the on-screen instructions and other information that help you use your computer. However, if you turn on Balloon Help—by choosing Show Balloons from the Guide (question mark) menu—and point to a Guide file icon (any icon with the Guide question mark

on it) on the hard disk, the balloon may give you the wrong information about where the file belongs or how to use it. To avoid being misled by incorrect balloons, follow the guidelines below:

- Leave Guide files where they are. Some Guide files (for example, the Guide file named "Macintosh Guide") belong in the Extensions folder. Other Guide files do not belong in the Extensions folder—and will not work if they are put there.
- Keep application programs that have Guide files in the same folder as the Guide file. For example, keep the file named "File Assistant Guide" in the same folder as the File Assistant program. If you move a Guide file that belongs with an application program, you won't be able to get help while using the program.

PowerTalk and PowerTalk Direct Dialup Mail

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Presenting QuickTime Movies at Double Size

Using MoviePlayer 2.0, you can play a movie at double (2X) size. You cannot present a movie (that is, play the movie on a second monitor) at double size. Presenting a movie at 2X size results in the MoviePlayer application quitting without warning.

••NOTE: This is not in the original ReadMe file.
The early releases of the Power Macintosh 7200 and 9500 shipped with MoviePlayer 1.0 installed on the hard drive.••

Printing With Apple PhotoFlash

If you have problems printing images with the PhotoFlash software, make sure that you choose a printer in the Chooser before you choose the Print command from the File menu.

QuarkXPress

To use QuarkXPress with System 7.5 or later on a Power Macintosh, you must upgrade to QuarkXPress version 3.3.1 or later.

Screen Flashes at Startup

You may see the screen flash during startup of your Power Macintosh. The flash is normal. It occurs because software needed to use the monitor is being loaded.

The Assistant Toolbox and Non-Networked Printers

The Print Later option (LaterLaser) of the Assistant Toolbox extension is not compatible with some non-networked PostScript printers. If you have the Assistant Toolbox extension installed on your computer and you want to print

with a non-networked printer, you may want to turn off the Assistant Toolbox extension.

For example, if you want to print with a LaserWriter Select 310 printer, you need to turn off the Assistant Toolbox extension (in the Extensions Manager control panel) to be able to use the Print Later option.

Using a RAM disk

If your computer has 8 megabytes of RAM (random access memory), and you wish to set up a RAM disk, allocate no more than 500K to the RAM disk. Otherwise, when you start your Macintosh you may see the message, "This disk is unreadable by this Macintosh. Do you want to initialize the disk?" (Important: This message applies to the RAM disk only. Your hard disk will not be initialized.)

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Security: Everyone

Macintosh Performa 5200CD Series: Description (4/97)

=====

Article Created: 13 July 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides a description of the Macintosh Performa 5200 series computers.

The following computers are in the Macintosh Performa 5200 series: Performa 5200 and Performa 5215.

DISCUSSION -----

The Macintosh Performa 5200CD combines the ultrahigh performance of PowerPC technology with sound, video, and CD-ROM multimedia capabilities in an all-in-one system that's easy to set up.

And it's a Macintosh, so you are assured that it runs easy-to-use Macintosh software. It also runs applications accelerated for Power Macintosh computers at two to six times the speed of Macintosh computers based on the 68040 chip.

This multimedia computer supports up to 32,000 colors on its built-in 15-inch color display (12.8-inch viewable image size), and includes a CD-ROM player for both multimedia and audio CD sound that can be played using its stereo speakers or headphones.

Its multimedia options offer new ways to interact with information. You can connect to an external video source such as a VCR or camcorder to cut and paste video images. You can also add a connection to a large-screen TV or LCD projection panel for displaying presentations. And you can add an internal TV tuner—with a remote control—to view television channels in a window on your display.

Multiple ports allow you to connect it to peripherals such as external disk drives or scanners. And a flexible communications slot makes it easy to add a modem or an Ethernet networking card.

Based on the fast 75-megahertz PowerPC 603 microprocessor, the Macintosh Performa 5200CD comes with 8 megabytes of RAM, expandable to 64 megabytes. Its 500-megabyte hard disk offers ample room for multimedia storage.

The affordable Macintosh Performa 5200CD includes standard features that are expensive add-ons for other com-puters. These include 16-bit CD stereo sound and AppleTalk networking for access to printers, electronic mail, and file sharing.

Incredibly capable, yet amazingly affordable, the Macintosh Performa 5200CD will bring high-performance multimedia computing within the reach of people in schools, offices, and homes.

Power and speed

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus

Memory

- 8 MB or 16 MB RAM expandable up to 64 MB
- 1 MB DRAM frame buffer (separate from RAM) for video memory, not expandable

Display

- 15" flat square shadow mask CRT
- .28 mm dot pitch
- Resolutions from 640x480 to 832x624

Expansion

- Comes with built-in ports for hard drives, printers, scanners, and modems
- Supports most processor-direct cards compatible with Macintosh Quadra 605 and Macintosh LC series of computers via an internal expansion slot
- Includes a communications slot with a 14.4 Kbps fax send/receive Global Village IIv modem installed
- Has video slot for NTSC, PAL, and SECAM video-input card
- Includes expansion bay for television tuner
- External drop box provides expansion for NTSC or PAL video output

Audio System

- Stereo 16-bit sound capable of driving stereo headphones or other stereo equipment through the sound jacks
- Stereo 16-bit CD playback
- Integrated stereo speakers
- Built-in microphone

System Software

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

At Ease: Unable To Access The Documents Folder Message (9/95)

Revised: 9/27/95
Security: Everyone

At Ease: Unable To Access The Documents Folder Message (9/95)

=====

Article Created: 14 August 1995
Article Reviewed/Updated: 27 September 1995

TOPIC -----

I am running At Ease for Workgroups and using a server as the At Ease disk. When I turn on any of my client Macintosh computers running At Ease for Workgroups, I get the message "Unable to access the documents folder on the At Ease disk. Please contact your server's administrator." The server shows up on the network, but no machine in the workgroup is able to find the documents folder.

DISCUSSION -----

This message is indicating that At Ease cannot find the server, since the server does show up on the network, the preferences file for At Ease has become corrupted.

You can correct this by following these steps:

Step 1

Restart one of your client computers while holding down the Shift key until you see the message, "Welcome to Macintosh, Extensions off".

Step 2

Enter the administrator's password when At Ease asks you to do so.

Step 3

Drag the At Ease Prefs file from the At Ease folder in your System Folder to the Trash.

Step 4

Choose Restart from the Special menu.

Step 5

On the server you are using as the At Ease disk, open the At Ease folder.

Step 6

Drag the At Ease Prefs file to the Trash.

Step 7

On the client machine, mount the At Ease server volume.

Step 8

Launch At Ease Setup.

Step 9

If you are using At Ease 2.0, 2.0.1 or 2.0.3, under Options Choose "At Ease Disk..."

Click the radio button next to Mounted Server, select the mounted volume, click Okay.

If you are using At Ease 3.0, under Network choose At Ease Server, click the button next to Mounted Server, select the mounted volume, click Okay.

You next need to update all the other computers on the network using the Remote Administration features of At Ease. If the computers you wish to update are unable to launch At Ease, follow the above procedure omitting steps 5 and 6.

If some of your At Ease client machines are able to launch into At Ease, update them using the following procedure. From within At Ease Setup on the first client you just reconfigured, follow these steps:

If you are using At Ease 2.0, 2.0.1, or 2.0.3

=====

Step 1

Under Options choose Update Computers... A dialogue box appears with a list of all the computers running At Ease with Allow Remote Administration checked in the Security window under the Options menu.

Step 2

Select each computer you want to update, click Okay.

If you are using At Ease 3.0

=====

Step 1

Under Network choose At Ease Computers, a dialogue box appears with a list of all the computers running At Ease with Allow Remote Administration selected in the User Settings window under the Security menu.

Step 2

Click each computer you want to update, click Okay.

MAE: Freezes in AutoContent Wizard in PowerPoint 4.0 (7/95)

Revised: 7/13/95
Security: Everyone

MAE: Freezes in AutoContent Wizard in PowerPoint 4.0 (7/95)

=====

Article Created: 13 July 1995

TOPIC -----

I am using Office 4.2.1 on a SPARC running MAE 2.0. When I launch the Wizard software within PowerPoint 4.0, MAE locks up.

I increased the PowerPoint's memory to 3.5 MB and the Wizard starts to load but then gives an error message that the Cue Cards did not load.

DISCUSSION -----

Engineering has been able to duplicate the similar hanging situation at the final step after choosing the "AutoContent Wizard" way for creating a new presentation.

Engineering has also encountered the following error message if the Microsoft Office Manager control panel was placed in the Control Panels folder:

"Microsoft Office Manager could not start due to a memory error."

We did not get the "Cue Cards did not load..." message though.

Engineering is investigating this compatibility problem.

QuickDraw GX: Paper Type Editor (7/95)

Revised: 7/13/95
Security: Everyone

QuickDraw GX: Paper Type Editor (7/95)

=====

Article Created: 13 July 1995

TOPIC -----

I am having trouble creating paper types using Paper Type Editor 1.0.2, with QuickDraw GX 1.1.2. When I go to select LWP 630 (change from Any Printer) from Printer option, I get the message "Editor cannot switch printer settings: Printer doesn't contain any paper types." Why is this happening?

DISCUSSION -----

This is a known issue identified in the original version of the Paper Type Editor. There were plans to allow individual printers to have paper types, however, this feature was never implemented. The Paper Type Editor was never changed to reflect this, and so the reason for the message "...Printer doesn't contain any paper types" when selecting a specific printer.

The Paper Type Editor will be revised (in the next major release of QuickDraw GX) so that specific printers WILL NOT show up in the list. In the interim, the simple workaround is to ignore individual printers and select "LaserWriter GX" for any network LaserWriter printer.

QuickTime VR: Processing Time To Create VR Movie (7/95)

Revised: 7/13/95
Security: Everyone

QuickTime VR: Processing Time To Create VR Movie (7/95)

Article Created: 13 July 1995

TOPIC -----

This article illustrates some typical steps you would take to create a QuickTime VR movie and the processing time involved.

DISCUSSION -----

Apple has done some testing to help you get an idea of the performance and time needed for post production work on a VR project. Here are some typical times for the steps that you perform creating a VR movie.

The estimated times for each command are from a Power Mac 8100 and a 33 MHz RC68040. The numbers indicate the native tools really benefit the Power Macintosh user.

.	Processing time required on:	
VR Action	8100 Power Mac	33 MHz 040 w/FPU
=====	=====	=====

Stitching 2 PICTs together	2 Minutes	20 Minutes
----------------------------	-----------	------------

You could have as many as 18 stitches for one panorama, typically 12 for a 15-18 mm lens.

Dicing one panorama node	2 Minutes	20 Minutes
--------------------------	-----------	------------

Time is PER DICE, one node might require 24 dices.

Linking	2 Minutes	20 Minutes
---------	-----------	------------

To link nodes to nodes, time PER LINK. You need to link twice to move back and forth between nodes.

Compression per node	2 Minutes	20 Minutes
----------------------	-----------	------------

POWER MAC EXAMPLE:

If you were stitching 12 PICTs for a single node, that computation could take 24 minutes for the entire node.

If you then diced that node, it would probably take 48 minutes.

For linking this node to another, 4 minutes.

Compression of this node, 2 minutes.

The grand total for post production time on one node is around 78 minutes. This doesn't include planning, shooting, or learning the tools.

A QuickTime VR movie of rotation around a stationery object would require similar steps to those shown above, but may include many more shots. To do a complete rotation of an object (24 shots around the object at 0°, 24 shots at +10°, 24 shots at +20°, and so on) the movie would consist of over 600 PICTs.

Macintosh Performa 631CD: Technical Specifications (11/95)

Article Created: 13 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article gives the technical specifications for the Macintosh Performa 631CD computer.

DISCUSSION -----

Microprocessor

- 66/33-MHz Motorola 68LC040 with 32-bit data bus
(66-MHz processor/33-MHz data bus)

Memory

- 8 MB RAM, expandable to 52 MB
- RAM expansion via two 72-pin SIMM sockets
(one double-sided SIMM can take up to 32 MB; one single-sided SIMM can take up to 16 MB)

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 500 MB IDE type hard disk
- AppleCD 300i Plus CD-ROM player

Video Display

- Comes with Apple Performa Plus Display: 14-inch RGB Color Monitor color display, 640-pixel by 480-pixel resolution, 0.28-mm dot pitch, noninterlaced
- Supports Apple displays of up to 15 inches
- Works with a wide range of third-party VGA and SVGA displays
- 1MB DRAM display support, independent from system DRAM
- Standard 16-bit color for display of up to 32,768 colors on monitors of

up to 14 inches and on 15-inch monitors at 640- by 480-pixel resolution

- Standard 8-bit color for display of 256 colors on 15-inch monitors at 800-pixel by 600-pixel resolution

Modem

-
- Comes with TelePort/Gold II for Performa from Global Village Communications: 14,400-bps send and receive fax and 14,400-bps send and receive data.

Interfaces

-
- One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other devices
 - Two (RS-232/RS-422) serial ports
 - SCSI interface port for connecting up to five external peripheral devices
 - Internal expansion slot compatible with most Macintosh Performa 400 and 500 series, Macintosh Quadra 605, Macintosh LC II, LC III, LC 475, LC 520, and LC 575 processor-direct cards
 - Communications slot for future addition of either Ethernet card or 14.4-baud fax/modem card
 - Video slot for NTSC, PAL, and SECAM video-input card
 - Dedicated connector for internal TV tuner
 - One standard monitor port also supports connection to external video-out (NTSC or PAL) drop box

Audio capabilities

-
- 8-bit on-board Stereo sound output and mono sound in
 - Stereo 16-bit CD playback
 - One sound-in port
 - Front and rear headphone jacks

Networking

-
- Built-in AppleTalk port

Keyboard and Mouse

-
- AppleDesign Keyboard
 - Apple Desktop Bus Mouse II

Clock/Calendar

-
- Custom integrated circuit with long-life lithium battery

Disability Access

-
- CloseView, Easy Access, and the ability to substitute visual cue for beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

Electrical Requirements

- 100-240 volts AC, 50-60 Hz
- Power: 45 W maximum, not including monitor

ADB Power Requirements

- 500ma maximum draw

Size and Weight

- Height: 4.3 in. (10.95 cm)
- Width: 12.6 in. (32 cm)
- Depth: 16.5 in. (41.95 cm)
- Weight: 19 lb. (8.6 kg) with CD-ROM player
(varies based on internal devices installed)

Operating Environment

- Operating temperature 50° F to 104° F (10° C to 40° C)
- Storage temperature -40° F to 116.6° F (-40° C to 47° C)
- Relative Humidity 5% to 95% noncondensing
- Altitude Works below 10,000 feet (3048 m)

Software

=====

System software

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

Third-party software bundle

- At Ease
- ClarisWorks
- Click Art Performa Collection
- Crossword Wizard
- MacGallery Clip Art Treasure Pak
- MacLink Plus Easy Open T ranslators

Macintosh Performa 631CD: Description (4/97)

=====

Article Created: 14 July 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides a description of the Macintosh Performa 631CD computer.

DISCUSSION -----

Overview
=====

The Apple Macintosh Performa 631CD computer is one of the most affordable and flexible Apple multi-media system. It is upgradeable to take advantage of PowerPC technology, so it can bring you multimedia opportunities for years to come.

Packed in one box are the computer, display, keyboard, mouse, and fax/modem, as well as operating system software. In addition, the computer includes 14 useful home, education, and home-business software programs, and 7 valuable CD-ROM reference titles. Like all Macintosh computers, the Performa is very easy to learn about and use, and it runs thousands of Macintosh education, business, and multimedia programs.

The Performa 631CD also has advanced multimedia expansion options that offer new ways to interact with information. You can connect it to an external video source such as a VCR or camcorder to cut and paste video images. You can also add an option to connect your computer to a large-screen TV for displaying presentations. And you can add an internal TV tuner to view television channels in a window on your display.

This affordable computer includes many standard features that are expensive add-ons for other computers. It provides 16-bit CD stereo sound; support for Apple and third-party displays; and AppleTalk networking for access to printers, electronic mail, and file sharing. With its wealth of software, the Macintosh

..TIL18164-Macintosh_Performa_631CD-Description_4-97.pdf

Performa 631CD computer adds up to expandable, flexible multimedia systems.

Features

=====

Complete system

- Ready to run, right out of the box
- Easy to set up, learn, and use
- Includes computer, color 14-inch display (11.9 inch diagonal viewable image size), keyboard, mouse, digital sound, and internal speaker all in one box
- Includes built-in, double-speed, tray-loading CD-ROM player
- Comes with 14.4K-bps external fax modem
- Requires no additional software or cables
- Includes energy-saving feature that reduces power consumption by 50 percent for EPA Energy Star compliance

Expansion

- Ready for PowerPC upgrade
- Comes with built-in ports for hard drives, printers, scanners, and modems
- Supports most processor-direct cards compatible with Macintosh Performa 400 and 500 series, and Macintosh LC computers via internal expansion slot
- Includes a communications slot for an Ethernet connection or 14.4K bps fax/data modem
- Has video slot for NTSC, PAL, and SECAM video-input cards
- Standard monitor port also provides expansion via external drop box for NTSC or PAL video output
- Includes connector for TV tuner

Power and speed

- 66/33-MHz Motorola 68LC040 with 32-bit data bus
(66-MHz processor/33-MHz data bus)

Memory

- 8 MB RAM expandable up to 52 MB

Audio System

- 8-bit on-board Stereo sound output and mono sound in
- Stereo 16-bit CD playback
- One sound-in port
- Front and rear headphone jacks

Software

Power Macintosh 9500: Worldscript Updater 1.0 Issue (8/95)

Revised: 8/31/95
Security: Everyone

Power Macintosh 9500: Worldscript Updater 1.0 Issue (8/95)

Article Created: 14 July 1995
Article Reviewed/Updated: 31 August 1995

TOPIC -----

I installed Chinese Language Kit (CLK) 1.1 and Chinese Language Kit Updater 1.1.1 on my Power Macintosh 9500/120 computer. Why doesn't it work?

DISCUSSION -----

WorldScript Updater 1.0 must be installed first for the Chinese Language Kit to work on the Power Macintosh 7200/7500/8500/9500 series of computers.

Installation Steps

You must perform the installation in the following order:

Step 1

Install WorldScript Updater 1.0

Step 2

Install Chinese Language Kit 1.1

Step 3

Install Chinese Language Kit Updater 1.1.1

If you install WorldScript Update 1.0 last, your System file could end up being corrupted. If this occurs, you need to perform a "clean install" of the System Software, then reinstall the preceding items in that order.

Additional Information

Refer to the Tech Info Library article titled "System 7.5: Clean Install Procedure" for clean install instructions or the article titled System 7.5 Clean Install in the "Information Alley" Volume I, Issue 18, Page 8.

This article was published in the "Information Alley":

Macintosh Performa 6116CD: Description (4/97)

=====

Article Created: 14 July 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides a description of the Macintosh Performa 6116CD computer.

DISCUSSION -----

Overview

=====

The Macintosh Performa 6116CD brings together the performance of Power PC technology with world class ease-of-set up and use and price/performance in a complete system. It is targeted at families and individuals looking for a complete high performance multimedia com-puter system. All systems include the CPU, monitor, fax modem, Apple Design Keyboard and Mouse as well as leading third party software applications.

In addition, the Macintosh Performa 6116CD with PowerPC Technology is bundled with 18 software applications to take advantage of Power Macintosh capabilities of two to six times the speed of previous Macintosh computers based on the 040 chip. It also supports MS-DOS and Windows applications when using SoftWindows software or when using an optional DOS Compatibility card.

Based on the 60-megahertz PowerPC 601 microprocessor co-developed by Apple, IBM, and Motorola, the Macintosh Performa 6116CD has built-in, floating-point math coprocessors and comes with a 700 MB hard disk with 8 megabytes of RAM, expandable to up to 72 megabytes in addition to a built in CD-ROM. It also provides on-board high-speed Ethernet support.

Additionally, the Performa 6116CD can easily be expanded as it includes eight built-in ports and one expansion slot.

This affordable computer includes an Apple 14" diagonal high-resolution color display along with a fast, Global Village 14.4k-bps modem, as well as speech-recognition, and text-to-speech capabilities that are built into the

computer. With an AV expansion kit the Macintosh Performa 6116CD can add the functionality of S-video and composite video input as well as output for use with televisions, video cameras, and video recorders. The Macintosh Performa 6116CD provides an affordable gateway to Power PC technology and the future of personal computing.

Features

=====

Fast, easy setup

- Simple to set up and learn; your system is ready to go the first time you turn it on
- Includes 14" color display (11.9 inch diagonal viewable image size), keyboard, mouse, digital sound, and internal speaker all in one box
- Built-in, double speed, tray-loading CD-ROM player
- Includes 14.4K-bps Global Village modem

Compatibility

- Runs Macintosh applications
- Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats

Communications

- GeoPort- and LocalTalk-compatible serial ports
- 16-bit stereo audio input and output
- Built-in AppleTalk networking
- Built-in Ethernet networking

Power and memory

- PowerPC 601 RISC microprocessor
- 8 MB of RAM standard, expandable to 72 MB

Audio System

- 16-bit stereo in and out
- Output port for stereo compact disc audio and stereo computer-generated sound.
- Input port for stereo sound input (supports 16-bit stereo audio)

System 7.5 software

- PC Exchange for reading and writing MS-DOS and Windows disks
- AppleScript for scripting in and between Macintosh applications
- QuickTime for working with video and sound as easily as text and graphics • TrueType fonts for outstanding results on the screen and the page
- Apple Guide

DISCUSSION -----

Overview

=====

The Apple Macintosh Performa 636CD computer is one of the most affordable and flexible Apple multi-media system. It is upgradeable to take advantage of PowerPC technology, so it can bring you multimedia opportunities for years to come.

Packed in one box are the computer, keyboard, mouse, and fax/modem, as well as operating system software. Configured specifically for higher education, the computer includes useful education and personal productivity programs. Like all Macintosh computers, the Performa is very easy to learn about and use, and it runs thousands of Macintosh education, business, and multimedia programs.

The Performa 636CD also has advanced multimedia expansion options that offer new ways to interact with information. You can connect it to an external video source such as a VCR or camcorder to cut and paste video images. You can also add an option to connect your computer to a large-screen TV for displaying presentations. And you can add an internal TV tuner to view television channels in a window on your display.

This affordable computer in-cludes many standard features that are expensive add-ons for other computers. It provides 16-bit CD stereo sound; support for Apple and third-party displays; and AppleTalk networking for access to printers, electronic mail, and file sharing. With its wealth of software, the Macintosh Performa 636CD computer adds up to expandable, flexible multimedia systems.

Features

=====

Complete system

- Ready to run, right out of the box
- Easy to set up, learn, and use
- Includes built-in, double-speed, tray-loading CD-ROM player
- Includes energy-saving feature that reduces power consumption by 50 percent for EPA Energy Star compliance

Expansion

- Ready for PowerPC upgrade
- Comes with built-in ports for hard drives, printers, scanners, and modems • Supports most processor-direct cards compatible with Macintosh Performa 400 and 500 series and Macintosh LC computers via internal expansion slot
- Includes a communications slot for an Ethernet connection or 14.4K bps fax/data modem
- Has video slot for NTSC, PAL, and SECAM video-input cards
- Standard monitor port also provides expansion via external drop box for NTSC or PAL video output
- Includes connector for TV tuner

Power and speed

- 66/33-MHz Motorola 68LC040 with 32-bit data bus
(66-MHz processor/33-MHz data bus)

Memory

- 8 MB RAM expandable up to 52 MB

Display

- Supports Apple displays of up to 15 inches
- Works with a wide range of third-party VGA and SVGA displays
- 1MB DRAM display support, independent from system DRAM
- Standard 16-bit color for display of up to 32,768 colors on monitors of up to 14 inches and on 15-inch monitors at 640- by 480-pixel resolution
- Standard 8-bit color for display of 256 colors on 15-inch monitors at 800-pixel by 600-pixel resolution

Audio System

- 8-bit on-board Stereo sound output and mono sound in
- Stereo 16-bit CD playback
- One sound-in port
- Front and rear headphone jacks

Macintosh Performa 6116CD: Technical Specifications (4/97)

Article Created: 14 July 1995
Article Reviewed/Updated: 24 July 1995

TOPIC -----

This article gives the technical specifications for the Macintosh Performa 6116CD computer.

NOTE:

Because of differences in bundling and configuration, other Macintosh Performa 6100 series computers are not included in this article. See the article titled "Performa 6100 Series: Specifications" for information about these other models.

DISCUSSION -----

Microprocessor

- 60-MHz PowerPC 601 RISC Processor

Memory

- 4 MB ROM
- 256 bytes of non-volatile parameter memory
- 8 MB of RAM standard, expandable to 72 MB
- 2 SIMM slots (1 pair)
- 80 ns (nanosecond) SIMMs or faster
- SIMMs can be 4 MB, 8 MB, 16 MB or 32 MB, but must be installed in pairs of the same size. For example, you should install two 8 MB SIMMs in first two adjoining slots.
- Possible RAM configurations are 8, 16, 24, 40 and 72 MB.
- L2 Cache Slot for Optional 256K Macintosh Cache Card

RAM note: All 8MM RAM configurations come with 8MB of RAM soldered onto the logic board

Form Factor

- Modular desktop enclosure (similar to Quadra 610, 660av enclosure)

Disk Drives

- One Built-in Apple SuperDrive 1.4 MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- Support for one internal one-third, 5.25-inch height SCSI devices, one of which may be used for removable media, such as an internal CD-ROM drive.
- One 700 MB internal one-third height hard disk
- Internal Apple CD-ROM drive; AppleCD 300i drive
- Optional external SCSI hard disk drive (many capacities available)

Video Display

- Comes with Performa Plus 14 Display
- DRAM based video: 16 bit on 14-inch monitors, 8 bit on 16-inch monitors. DRAM based video is not expandable. (The table below details support for specific monitors.)
- VRAM based video: No VRAM video support or expansion.

Monitor:	Resolution:	Colors or Grays:
12-inch Color	512 by 384	thousands
12-inch Monochrome	640 by 480	256
13-inch or 14-inch Color or VGA	640 by 480	thousands
15-inch Portrait Monochrome	640 by 870	256
16-inch Color	832 by 624	256
Multiple Scan 15 Display	640 by 480	thousands
Multiple Scan 15 Display	832 by 624	256

Note: Built-in video (HDI-45 with 640K DRAM support) doesn't support any monitor with a resolution greater than 832 by 624. To use a larger monitor (19-inch, 20-inch, or 21-inch), a third-party video card or the AV card must be used.

Interfaces

- One internal Nubus 90 PDS slot. Support block transfers to and from main memory, 2x block transfers card to card. There is a NUBUS adapter for the Power Macintosh 6100. A NuBus card Requires an adapter card & bracket. There is only one slot, so it supports one PDS card OR one NuBus card.
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices.
- One AAUI-15 Ethernet connector.
- Two serial (RS-232/RS-422) ports.
(1 Printer/LocalTalk, 1 Modem, both support GeoPort)
- SCSI interface for connecting up to a total of seven SCSI devices.
- Sound output port for stereo compact disc audio and stereo computer-generated sound.
- Sound input port for stereo sound input (supports 16-bit stereo audio)

- One AV Display Connector supports the Apple AudioVision 14 Display. The bundled Video Adapter Cable (Part #M2681LL/A) allows you to connect a monitor with a standard DB-15 connector to your Power Macintosh built-in video.
- One internal 601 PDS (processor direct slot)
- One internal L2 (Level 2) cache slot

Audio System

- 16-bit stereo in and out
- Sample rates of 48, 44.1, 24, 22.05 kilohertz (kHz)
- Input line level: 1 volt peak-to-peak
- Output line level: 1 volt peak-to-peak
- Input SNR (signal-to-noise ratio): 82 decibels (dB) with no audible discrete tones
- Output SNR: 85 dB with no audible discrete tones
- Bandwidth: 20 Hz-20 kHz (+/- 2 dB) at 44.100 kHz sample rate
- THD+N (Total harmonic distortion plus noise): Less than 0.05 percent; measured 20 Hz-20kHz with a 1-Vrms sine wave input.

Networking

- Built-in Ethernet
- Serial port for AppleTalk
- Integrated GeoPort telecommunications architecture for data, fax, and voice connectivity.

Keyboard

- AppleDesign keyboard included

Mouse

- Apple Desktop Bus Mouse II

Clock/Calendar

- CMOS custom chip with long-life lithium battery.

Apple PlainTalk Microphone (optional)

- The microphone is unidirectional and optimized for use with speech recognition.

Modem

- Comes with TelePort/Gold II for Performa from Global Village Communications: 14,400-bps send and receive fax and 14,400-bps send and receive data.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured

- Frequency: 50 to 60 hertz, single phase
- Power Supply Output Rating (Power available for internal devices)
 - Continuous output 86W
- A/C Line Input (Power drawn by the Power Macintosh 6100/60)
 - Maximum continuous 132W
 - Peak input 201W

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws 10 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Size and Weight

Main unit

- Height: 3.4 inches (8.5 cm)
- Width: 16.3 inches (41.5 cm)
- Depth: 15.6 inches (39.7 cm)
- Weight*: 14.0 pounds (6.4 kg)

*Weight varies based on internal devices installed

Mouse

- Height 1.3 inches (33 mm)
- Width 2.4 inches (61.7 mm)
- Depth 4.2 inches (107.3 mm)
- Weight 4 ounces (0.10 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F (-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048m)

Macintosh Performa 636CD: Technical Specifications (4/97)

Article Created: 14 July 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article gives the technical specifications for the Macintosh Performa 636CD computer.

DISCUSSION -----

Microprocessor

- 66/33-MHz Motorola 68LC040 with 32-bit data bus
(66-MHz processor/33-MHz data bus)

Memory

- 8 MB RAM, expandable to 36 or 52 MB (depending on the model*)
- RAM expansion via one or two 72-pin SIMM sockets (depending on the model*)
(one double-sided SIMM can take up to 32 MB; one single-sided SIMM can be up to 16 MB)

*Note: Later models have two SIMM slots. Earlier models have one.

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 500 MB IDE type hard disk
- AppleCD 300i Plus CD-ROM player

Video Display

- Supports Apple displays of up to 15 inches
- Works with a wide range of third-party VGA and SVGA displays
- 1MB DRAM display support, independent from system DRAM
- Standard 16-bit color for display of up to 32,768 colors on monitors of

..TIL18169-Macintosh_Performa_636CD-Technical_Specifications_4-97.pdf

up to 14 inches and on 15-inch monitors at 640- by 480-pixel resolution

- Standard 8-bit color for display of 256 colors on 15-inch monitors at 800-pixel by 600-pixel resolution

Modem

- Comes with TelePort/Gold II for Performa from Global Village Communications: 14,400-bps send and receive fax and 14,400-bps send and receive data.

Interfaces

- One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other devices
- Two (RS-232/RS-422) serial ports
- SCSI interface port for connecting up to five external peripheral devices
- Internal expansion slot compatible with most Macintosh Performa 400 and 500 series, Macintosh Quadra 605, Macintosh LC II, LC III, LC 475, LC 520, and LC 575 processor-direct cards
- Communications slot for future addition of either Ethernet card or 14.4-baud fax/modem card
- Video slot for NTSC, PAL, and SECAM video-input card
- Dedicated connector for internal TV tuner
- One standard monitor port also supports connection to external video-out (NTSC or PAL) drop box

Audio capabilities

- 8-bit on-board Stereo sound output and mono sound in
- Stereo 16-bit CD playback
- One sound-in port
- Front and rear headphone jacks

Networking

- Built-in AppleTalk port

Keyboard and Mouse

- AppleDesign Keyboard
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and the ability to substitute visual cue for beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

Electrical Requirements

100-240 volts AC, 50-60 Hz

Power: 45 W maximum, not including monitor

ADB Power Requirements

500ma maximum draw

Size and Weight

-
- Height: 4.3 in. (10.95 cm)
 - Width: 12.6 in. (32 cm)
 - Depth: 16.5 in. (41.95 cm)
 - Weight: 19 lb. (8.6 kg) with CD-ROM player
(varies based on internal devices installed)

Operating Environment

Operating temperature 50° F to 104° F (10° C to 40° C)

Storage temperature -40° F to 116.6° F (-40° C to 47° C)

Relative Humidity 5% to 95% noncondensing

Altitude Works below 10,000 feet (3,048 m)

Software

Macintosh Performa 640CD DOS Compatible: Description (4/97)

=====

Article Created: 14 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article provides a description of the Macintosh Performa 640 DOS Compatible computer.

DISCUSSION -----

Overview

=====

The Apple Macintosh Performa 640CD DOS Compatible computer is the perfect choice for your family when you want to keep your compatibility options open. It runs DOS, Windows, and Macintosh applications simultaneously, which essentially makes it two advanced CD multimedia computers in one.

The Performa 640CD DOS Compatible features dual microprocessors. Its 68LC040 processors provide excellent performance for easy-to-use Mac OS applications, while its 486DX2 processor delivers strong performance for DOS and Windows applications.

Because it's DOS-compatible, you can now easily use DOS and Windows applications, CDs, and games on a Macintosh. You can instantly switch between the Macintosh operating system (Mac OS) and the DOS or Windows environment. You can even cut, copy, and paste information between them. And it allows you to use Macintosh printers and peripherals with both operating systems.

Packed in one box are the computer, display, keyboard, mouse, fax/modem, and operating system soft-ware. In addition, this Performa in-cludes useful home, education, and home-business software programs, as well as CD-ROM reference titles.

Its advanced multimedia expansion options let you tailor it to fit your needs. You can connect it to an external video source such as a VCR or camcorder to cut and paste video images. You can also add an option to connect your computer to a

large-screen TV for displaying presentations. And you can add an internal TV tuner to view television channels in a window on your display.

The Macintosh Performa 640CD DOS Compatible computer delivers DOS and Windows compatibility, Macintosh usability, and advanced multimedia capabilities—making it one of the most versatile and capable multimedia computers ever built.

Features

=====

Complete, compatible system

- Ready to run Macintosh, DOS 6.22, and Windows 3.1 programs, right out of the box
- Includes Microsoft MS-DOS 6.22, Windows 3.1, and Macintosh System 7.5 software
- Easy to set up, learn, and use
- Includes Macintosh and DOS-compatible computer capabilities, color 15-inch display (13.3-inch viewable image size), built-in tray-loading CD-ROM player, keyboard, mouse, digital sound, and internal speaker all in one box
- Comes with external fax/modem that supports both Macintosh and Windows
- Requires no additional software or cables

Compatibility

- Built-in 68LC040 and 486DX2 microprocessors allow it to run MS-DOS, Windows 3.1, and Macintosh applications simultaneously
- Runs MS-DOS and Windows 3.1 applications, games, and CD-ROM discs directly on a 486 processor
- Supports Sound Blaster 16 sound output for PC multimedia compatibility
- Supports VGA and SVGA monitors
- Includes ODI driver for Novell NetWare IPX and TCP/IP support in the DOS and Windows environments
- Supports DOS-formatted floppy disks
- Includes PC game port

Integration

- Lets you copy and paste between Mac OS and DOS or Windows environments
- Allows you to share folders and disks between Mac OS and DOS or Windows environments
- Includes Macintosh PC Exchange, which you can customize to launch Mac OS applications when opening a DOS or Windows file
- Lets you print from either environment with a Macintosh-compatible printer

Processor and Memory

- 66/33 MHz 68LC040 microprocessor
 - 8MB of RAM (expandable to 52 MB of RAM)
- 1MB ROM
- 66 MHz 80486 DX2 microprocessor
 - 4MB of RAM (expandable to 32 MB of RAM)

Audio System

- 8-bit stereo sound in Macintosh environment
- Stereo 16-bit CD playback in Macintosh environment
- Sound Blaster 16-compatible 16-bit stereo sound output in DOS and Windows environments
- One sound-in and one sound-out port for Macintosh environment
- Front and rear headphone jacks
- Front panel push-button volume control

Upgrades

- The DOS-Compatibility Card uses the single PDS slot. Thus, the Macintosh Performa 640 DOS Compatible cannot be upgraded to a PowerPC processor.

Software

=====

System software

- Mac OS 7.5.1
- MS-DOS 6.22

Macintosh: Video Mirroring Compared To Dual Video (9/95)

Revised: 9/29/95
Security: Everyone

Macintosh: Video Mirroring Compared To Dual Video (9/95)

=====

Article Created: 14 July 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

What is the difference between video mirroring and dual video?

DISCUSSION -----

Video mirroring lets you display the same Macintosh image, complete with the menu bar, on two screens simultaneously. The second device can be a monitor, television, or overhead projector depending on the connection you have available. This capability is most useful for those in education or training environments who want to connect large monitors or projection screens to their computer.

Video mirroring is built-in on some PowerBooks, and an add-on option to both the Macintosh LC 580 and Power Macintosh 5200 computers. If you do not have built-in or add-on video mirror support, you can still get the benefits of this type of technology if your computer has a standard DB-15 video-out port, by using the Apple Presentation System or similar products from third party vendors.

Dual Video

Dual video means there are two independent video channels, each with its own dedicated Video RAM (VRAM). On Macintosh computers, this always means there is at least one video card installed. For example, the Power Macintosh 6100 series has built-in video capability, but the addition of a Power Macintosh AV card adds an independent additional video-out capability with a separate amount of VRAM. If you connect one monitor to each port on the Power Macintosh 6100 AV, you would see a "virtual desktop". You could have a window on one screen, your primary display, and a window on the second screen, the secondary display. You can arrange the orientation of the monitors so that the mouse will move between the two monitors at the point where they touch in the Monitors control panel. Only one monitor can display the menu bar, but you can choose which is the main monitor in the Monitors control panel. You do not get two identical images when

using dual video.

Due to the highly integrated characteristics of this type of multiple device support, you can theoretically have as many displays as you have slots. You could, for example, populate each available expansion slot on your Macintosh computer with a video card, and have that many monitors creating a large virtual desktop.

There is no processor performance degradation from the use of multiple displays. The relative performance of each display depends on the performance characteristics of the attached video card.

TITLE

MacTCP: Error Codes Defined

Article ID: 18173
Created: 7/14/95
Modified: 2/3/98

TOPIC

The following list defines error message name-to-number mapping, Internet Control Message Protocol(ICMP), and other miscellaneous types throughout the MacTCP driver.

DISCUSSION

These error messages DO NOT apply to Open Transport.

Error Messages

-23000	ipBadLapErr	Unable to initialize the local network handler.
-23001	ipBadCnfgErr	The manually set address is configured improperly.
-23002	ipNoCnfgErr	A configuration resource is missing.
-23003	ipLoadErr	Not enough room in the application heap (Macintosh 512K enhanced only)
-23004	ipBadAddr	Error in getting an address from a server or the address is already in use by another machine.
-23005	connectionClosing	A TCPClose command was already issued so there is no more data to send on this connection.
-23006	invalidLength	The total amount of data described by the WDS was either 0 or greater than 65,535 bytes.
-23007	connectionExists	The TCP or UDP stream already has an open connection.
-23008	connectionDoesntExist	The TCP stream has no open connection.
-23009	insuuficientResources	64 TCP or UDP streams are already open.
-23010	invalidStreamPtr	The specified TCP or UDP stream is not open.
-23011	streamAlreadyOpen	An open stream is already using the receive buffer area.
-23012	connectionTerminated	The TCP connection was broken; the reason will be given a terminate ASR.
-23013	invalidBufPtr	The receive buffer area pointer is 0 (nil).
-23014	invalidRDS	The RDS refers to receive buffers not

..TIL18173-MacTCP_Error_Codes_Defined_(TA34071).pdf

.		owned by the user.
-23014	invalidWDS	The WDS pointer was 0 (nil).
-23015	openFailed	The connection came halfway up and then failed.
.		
-23016	commandTimeout	The specified command action was not completed in the specified time period.
.		
-23017	duplicateSocket	A stream is already open using the local UDP port or a TC connection already exists between the local IP address and TCP port, and the specified remote IP address and TCP port.
.		
.		
.		
-23032	ipDontFragErr	The pack is too large to send without fragmenting and the Don't Fragment flag is set.
.		
.		
-23033	ipDestDeadErr	The destination host is not responding to address resolution requests.
.		
-23035	icmpEchoTimeoutErr	The icmp echo packet was not responded to in the indicated timeout period.
.		
-23036	ipNoFragMemErr	Insufficient internal driver buffers available to fragment this packet on send.
.		
-23037	ipRouteErr	No gateway available to manage routing of packets to off-network destinations.
.		
-23041	nameSyntaxErr	The <<hostname>> field had a syntax error. The address was given in dot notation (that is, W.X.Y.Z) and did not conform to the syntax for an IP address.
.		
.		
.		
.		
-23042	cacheFault	The name specified cannot be found in the cache. The domain name resolver will now query the domain name server and return the answer in the callback procedure.
.		
.		
.		
.		
-23043	noResultProc	No result procedure is passed to the address translation call when the resolver must be used to find the address.
.		
.		
.		
-23044	noNameServer	No name server can be found for the specified name string.
.		
-23045	authNameErr	The domain name does not exist.
-23046	noAnsErr	None of the known name servers are responding.
.		
-23047	dnrErr	The domain name server has returned an error.
.		
-23048	outOfMemory	Not enough memory is available to issue the needed DNR query or to build the DNR cache.
.		
.

MacTCP: How It Uses FTP Address to Connect (9/95)

Revised: 9/26/95
Security: Everyone

MacTCP: How It Uses FTP Address to Connect (9/95)

=====
Article Created: 14 July 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

I am beginning to use MacTCP and some Internet software for the first time. I have noticed that many times I type a hostname and do not connect to the server I intended to.

DISCUSSION -----

When you ask MacTCP to connect to a hostname, several steps occur before MacTCP connects.

If the Name is "Fully Qualified"
=====

MacTCP checks the hostname for a period. If the hostname ends in a period, MacTCP looks up exactly what was typed. This applies to names of any length. The default domain in MacTCP is ignored.

Examples

- If you ftp to ftp.info.apple.com, MacTCP always connects you to ftp.info.apple.com. (since it ends in a period).
- If you ftp to ftp. MacTCP looks for ftp. (it also ends in a period).

If the Name is "Partially Qualified"
=====

If the name typed is longer than one word (separated by periods), MacTCP connects to whatever was typed. The default domain in MacTCP is ignored.

Examples

- If you type ftp.info.apple.com, MacTCP looks for ftp.info.apple.com.
- If your default domain is apple.com and you type ftp.info, MacTCP ignores the domain and looks for ftp.info.

NOTE: Most Macintosh users expect this behavior, but it is important to remember that other TCP/IP software (UNIX, Open Transport, DOS software) may behave differently. Ideally, the second example would have resulted in a lookup for ftp.info.apple.com.

If the Name is Just a Hostname
=====

If the name is one word, then add the "default domain" from the MacTCP control panel.

Example

- If your domain is info.apple.com and you type ftp, MacTCP looks for ftp.info.apple.com.
- If the hosts file or domain name servers have information on the host and the host is working, you should connect to the desired machine.

System 7.5: Installing From Non-Apple CD-ROM (7/95)

Revised: 7/14/95
Security: Everyone

System 7.5: Installing From Non-Apple CD-ROM (7/95)

Article Created: 14 July 1995

TOPIC -----

I have installed System 7.5 from CD on my Macintosh computer and when I restart, my machine crashes immediately. I have tried starting with extensions off, but it still fails to get to the "Welcome to Macintosh" screen. I want to reinstall the System 7.5 software again but, I have a non-Apple CD-ROM drive and the CD will not mount when I start up off Disk Tools. How can I reinstall from the CD-ROM drive?

DISCUSSION -----

The proper way to install any system software is to start your computer off a volume other than the one to which the software is to be installed. This is most commonly done by starting off the Disk Tools disk and installing onto the volume you want to upgrade. When you want to install from a CD-ROM disc, you boot from the Disk Tools disk and then put in the CD-ROM disc and install on the hard drive. This procedure works for Apple CD-ROM Drives only because Apple's Disk Tools disk may not have the necessary drivers to mount your CD-ROM drive.

Because you have a third party CD-ROM drive, you were forced to insert the CD-ROM disc after you already were running your computer off the System software on your hard drive. You were then installing new system software over your existing active system software which may not execute properly.

The steps to remedy this situation is to re-install the previous system software and then to re-install the CD-ROM drive software which came with the your third party CD-ROM drive. You can now access the System 7.5 CD-ROM disc and use the disk images to make floppy disks of the System 7.5 install disks. You can then use these disks to follow the procedure for installing System 7.5 from floppies.

Page 10 of the System 7.5 Upgrade Guide contains the following:

"IMPORTANT: If you are installing from a CD onto a Macintosh with a non-Apple

CD-ROM drive, make a backup copy of the System 7.5 software before you begin installation. If you encounter problems during installation, you can install System 7.5 from the backup disks. (You won't be able to use your CD-ROM drive again until the System 7.5 software is installed on your computer. The startup disk that comes with your CD recognizes only Apple CD-ROM drives.) For instructions and disk images, see the Back-up CD folder on your CD."

Power Macintosh 9500: Which Shared Library Manager? (5/96)

=====

Article Created: 17 July 1995
Article Reviewed/Updated: 17 May 1996

TOPIC -----

Do any Power Macintosh series computers need both the Shared Library Manager and the Shared Library Manager PPC to run correctly?

Since I have a Power Macintosh series Computer should I remove the Apple Shared Library Manger and keep only the Shared Library Manager PPC?

DISCUSSION -----

You should not remove either of these components from the Extensions folder. Your Power Macintosh series computer needs both extensions so it can work properly with all native and emulated Apple Shared Library Manager (ASLM) clients and libraries.

PowerBook 550c (Japan Only): Technical Specifications (7/95)

=====

Article Created: 7 July 1995

TOPIC -----

This article provides technical specifications for the Macintosh PowerBook 550c computer.

****NOTE:** This is a product released only in Japan.**

DISCUSSION -----

On May 30, 1995, Apple Japan introduced the PowerBook 550c. The PowerBook 550c features five major changes over the previous PowerBook 500 series computers:

- Uses 66/33 MHz 68040 microprocessor with built-in Floating Point Unit . (FPU) - also called a math coprocessor.
- Includes 750 MB internal hard disk drive
- Uses 10.4 inch (264 mm) active matrix color display
- Weighs 6.8 lbs (3.1 kg). Approximately 7 oz. (200 gm) lighter than the . PowerBook 540c.
- The entire unit is a dark grey (versus the current duo tone color).

Also, since this is a Japanese Macintosh PowerBook 500 series computer, the keyboard has a Japanese Industrial Standard (JIS) layout.

Microprocessor

- 66/33-MHz 68040 microprocessor (with FPU). (the two speeds refer to the . internal processor and bus interface, respectively)
- 32-bit Address and Data bus
- Daughterboard (memory expansion) has a 32-bit bus running at 33MHz

RAM

- 4 MB RAM on logic board.
- Expandable to 36 MB with 70ns low power self-refreshing RAM (Apple 8 MB

. RAM Expansion Kit, or Third Party higher density RAM card)

Storage

- One built-in 1.4 MB Apple SuperDrive disk drive that uses high-density . floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and . ProDOS disks.
- One internal 750 MB hard disk.

Display/Video Out

- 10.4-inch (diagonal), backlit, active matrix color display
- 640 x 480 pixels, with 256 colors by 400 pixels with thousands of colors
- Sleeps on close
- User-configurable
- External display port (micro DV-14) supports 8-bit video
- External display options:
 - . Macintosh 12" Monochrome Display
 - . Macintosh 12" RGB Display
 - . AppleColor High Resolution RGB Display
 - . Macintosh Color Display
 - . Macintosh 16" Color Display
 - . Macintosh Portrait Display
 - . Some VGA and SVGA monitors (third party adapter required)
- Two video-out modes:
 - Video mirroring for simultaneous display of the same image on two . screens.
 - Dual display for full use of both screens.

Networking

- Serial/LocalTalk
- Built-in High Speed Ethernet with Apple AUI connector

System Software

- Requires KanjiTalk System 7.5 or later
- No Enabler is required

Battery

- Nickel-metal-hydride PowerBook Intelligent Batteries each provide up to . 3.5 hours of use before recharge.
- EverWatch battery-saver technology
- Batteries recharge in two hours when computer is in sleep or shutdown; . four hours when running.
- PowerBook Control Strip allows user to monitor time remaining, charge . time, and battery usage
- Backup rechargeable lithium battery maintains RAM in sleep modem while . main battery is removed for up to three minutes.

Keyboard and Tracking Device

- Built-in keyboard with standard size JIS keyboard with 79 keys including
. 12 function keys
- Two-level tilt adjustment
- Power-on key located on Keyboard
- Solid-state trackpad provides precise cursor control in response to the
. user's fingertip over its surface

Clock/Calendar

- CMOS custom chip with long-life lithium battery.

Microphone

- Built-in omnidirectional; output voltage is 4 mV, peak to peak, at
. normal volume

Interfaces

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices.
- One RS-422 serial port for LocalTalk networking, printers, modems, and
. other devices.
- One high-speed Ethernet port
- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other
. devices (up to 6 devices can be chained).
- One slot for optional modem.
- One video-out port, supporting 8 bit density and 256 colors.
- One stereo sound output port for external audio amplifier or headphones.
- One stereo sound-in port.
- Security slot for use with third-party equipment to lock the computer.
- 90-pin processor direct slot (PDS) for connecting PDS devices or
. optional PowerBook PCMCIA Expansion Module allows use of two Type II
. or one Type III PCMCIA-type card).
- One RAM slot

Modem

- Optional Apple Express Modem II

Built-in Stereo Sound

- CD-quality, 16-bit stereo sound capable of driving headphones or other
. stereo equipment.
- Two built-in stereo speakers
- Digital-to-analog and analog-to-digital conversion sampled
. at 11.035, 22.050, or 44.100 kHz.

Disability Access

- Easy Access and the ability to substitute visual cue for beep included
. with system software. These built-in solutions and third-party options
. provide alternative input and output devices for people with
. disabilities.

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 mA (a maximum of . three ADB devices is recommended)

Electrical Requirements

- Line voltage: 100 to 240 volts, 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage Temperature: -13°F to +140°F (-25 to +60° C)
- Relative humidity: 20% to 80% noncondensing
- Altitude: max. 10,000 ft. (3,048 m)
- Maximum Storage Altitude: 15,000 ft. (4,722 m)

Size and Weight

- Height: 2.3 in. (5.7 cm)
- Width: 11.5 in. (29.2 cm)
- Depth: 9.7 in. (24.5 cm)
- Weight: 6.8 lb. (3.1 kg)

Noise Level

- Noise free except for disk drive use.

Security

- Slot for security cable

LaserWriter 8.3: Desktop Print Spooler Causes Lockup (7/95)

Revised: 7/14/95
Security: Everyone

LaserWriter 8.3: Desktop Print Spooler Causes Lockup (7/95)

=====

Article Created: 14 July 1995

TOPIC -----

When I start up my computer, I am unable to select any menus or click on anything without the computer locking up. This started after installing the LaserWriter 8.3 driver.

DISCUSSION -----

These symptoms can occur when using PowerTalk on a Macintosh computer that is not a Power Macintosh. The solution is to update the Desktop Print Spooler, which was included with the LaserWriter 8.3 driver. The latest version is 1.0.2, and it is available on many online services.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Changing Names of Speech Setup Characters (7/95)

Revised: 7/14/95
Security: Everyone

Changing Names of Speech Setup Characters (7/95)

=====

Article Created: 19 Jan 1995
Article Reviewed/Updated: 14 July 1995

TOPIC -----

Customer has asked if any of the cartoon characters used in the speech set up menu can be changed along with their names.

DISCUSSION -----

Although it is NOT supported by Apple Computer, Inc., it is possible to change the character names and icons using ResEdit. You will need to modify the "SR Monitor" extension.

Character names can be found in the "STR " resource. Character icons can be found in the "PICT" resource.

*** WARNING ***

The instructions in this article refer to using ResEdit to alter your system software. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software. The User Assistance Center phone representatives (at 800-SOS-APPL) do not provide technical support for ResEdit. They will not help you to perform the procedure described here. ResEdit is supported by APDA. For contact information on APDA, search the Tech Info Library under "APDA".

Multiple System Folders On A Single Volume (7/95)

Revised: 7/14/95
Security: Everyone

Multiple System Folders On A Single Volume (7/95)

=====

Article Created: 8 February 1995
Article Reviewed/Updated: 14 July 1995

TOPIC -----

Is it okay to have a copy of the System in a folder labeled "Copy of System?"

DISCUSSION -----

With System 6.0.x, it was NOT okay to have two different System Folders, even if the names of the folders were different.

With System 7.x, it is possible to have multiple System Folders on a volume, as long as one folder is the "blessed" System Folder (that is, the blessed folder has a small Macintosh icon inside the icon of the folder). However, Apple Computer, Inc. still recommends using only one System Folder per volume. Any other situation is entered at your own risk. Apple Assistance Phone representatives will not help you manage multiple System Folders on one volume during troubleshooting.

Color LaserWriter 12/600 PS: Order of Toner Application (7/95)

Revised: 7/17/95
Security: Everyone

Color LaserWriter 12/600 PS: Order of Toner Application (7/95)

Article Created: 17 July 1995

TOPIC -----

What is the order of application in which the colored toner is applied to the paper on the Color LaserWriter 12/600 PS ?

DISCUSSION -----

The Color LaserWriter 12/600 PS uses monocomponent toner cartridges to transfer each individual color to the Organic Photo Conductor (OPC). This process is referred to as CMYK (or, C=Cyan, M=Magenta, Y=Yellow, and K=Black). CMYK is often confusing to some customers who interpret CMYK as the order in which the monocomponent toner is attracted to the OPC and then imparted to the paper. The order in which the toner is applied and attracted to the paper is:

Normal Print Mode

-
1. Magenta monocomponent toner
 2. Cyan monocomponent toner
 3. Yellow monocomponent toner
 4. Black monocomponent toner
 5. Fuser assembly, exit path

Best Print Mode

-
1. Paper attached to transfer drum for one complete revolution
 2. Magenta monocomponent toner
 3. Cyan monocomponent toner
 4. Yellow monocomponent toner
 5. Black monocomponent toner
 6. Fuser assembly, exit path

LW 16/600 and 12/600: Install Drivers on Windows NT (12/95)

Revised: 12/5/95
Security: Everyone

LW 16/600 and 12/600: Install Drivers on Windows NT (12/95)

Article Created: 17 July 1995
Article Reviewed/Updated: 5 December 1995

TOPIC -----

This article explains how to install the LaserWriter 16/600 PS and Color LaserWriter 12/600 PS drivers on Windows NT 3.5.

DISCUSSION -----

Step 1

From Windows NT 3.5, choose Create Printer from the Print Manager's Printer menu. The Create Printer dialog box appears.

Step 2

Select Other (at the bottom of the list) in the Driver Combo box.

Step 3

Insert the Apple Windows Printer Disk 2 into the floppy disk drive.

Step 4

Verify that the correct floppy drive is indicated in the Install Driver dialog box and click OK. A list of printer drivers appears.

Step 5

Select the printer driver that corresponds to your printer and click OK.

Step 6

Follow the instructions on the screen. If you are installing software from the Windows NT 3.5 CD, you may need to type the path for your driver location. The

path may be similar to this:

"c:\windows\system32\spool\drivers\w32x86\1\".

Click Continue and OK to complete the installation.

Step 7

If you are installing Windows NT 3.5 software from floppy disks, you copy the following files (followed by their locations) to the path of your driver location:

PSCRIPTUI.DLL (Disk 13)

PSCRIPT.DLL (Disk 13)

PSCRIPT.HLP (Disk 18)

Article Change History:

05 Dec 1995 - Included Color LaserWriter 12/600 PS.

Power Macintosh 9500 Series: Cannot Print to HP Printer (7/95)

Revised: 7/17/95
Security: Everyone

Power Macintosh 9500 Series: Cannot Print to HP Printer (7/95)

=====

Article Created: 17 July 1995

TOPIC -----

I have a Power Macintosh 9500 computer, and I cannot print to my Hewlett Packard 550c printer when connected via the serial port.

DISCUSSION -----

There is a known problem with serial printing to a 500 series based HP (Hewlett Packard) printer from a Power Macintosh 9500/120. As a workaround, you can print with LocalTalk. To do this, follow these steps:

1. Use LocalTalk connectors and cable; do not use a serial cable.
2. Verify that the correct port is selected in the Chooser. For example, if the LocalTalk cable is connected to the printer port, the printer port must be chosen in the Chooser.
3. Select the HP AppleTalk driver in the Chooser. Be sure to have the printer turned on before selecting the driver, or the printer may not appear in the chooser.

Hewlett Packard and Apple are working together on this issue, and this article will be updated when more information is available.

Power Macintosh 5200/75 LC: Mirrored Video Port Pin-Outs (7/95)

Revised: 7/17/95
Security: Everyone

Power Macintosh 5200/75 LC: Mirrored Video Port Pin-Outs (7/95)

=====

Article Created: 17 July 1995

TOPIC -----

Could you provide the Mirrored Video Port (MVP) pin-out information for the Macintosh 5200/75 LC and Performa computers?

DISCUSSION -----

Because the MVP Video output is a mirrored version of the internal video, the display resolution is set by the internal monitor setting. The MVP port retains the same monitor size as is set for the internal monitor.

The pin-outs are as follows:

Mirrored Video Port (MVP)

DB-15	MVP Con	Description
=====	=====	=====
1	1	Ground
2	3	Red Video
3	5	Composite Sync
4	7	NO Connection
5	9	Green Video
6	11	Ground
7	13	NO Connection
8	15	Attn Dot Clk Signal
9	2	Blue Video
10	4	NO Connection
11	6	Ground
12	8	Vertical Sync
13	10	Ground
14	12	Ground
15	14	Horizontal Sync
Shell	16	Ground

How De-installing QuickDraw GX Affects Fonts (9/95)

Revised: 9/28/95
Security: Everyone

How De-installing QuickDraw GX Affects Fonts (9/95)

=====

Article Created: 17 July 1995
Article Reviewed/Updated: 28 September 1995

TOPIC -----

The following discussion is a list of common Questions and Answers (Q&A) about how fonts are handled when QuickDraw GX is de-installed.

DISCUSSION -----

QUESTION: Does De-installing QuickDraw GX un-convert the fonts, or does it simply copy the archived fonts back into the Fonts folder?

ANSWER: Performing a "Custom Remove" of ATM GX using the QuickDraw GX Installer deletes the "converted" Type 1 font(s) and copy back the screen and printer Type 1 fonts from the Archived Type 1 fonts folder to the Fonts folder.

The only fonts "converted" when installing QuickDraw GX are Type 1 fonts. However, these fonts were actually not "converted," but instead a new font is created from the screen and printer fonts. The screen and printer fonts are then placed into the Archived Type 1 fonts folder.

NOTE: This process ONLY takes place if ATM GX is selected as part of the QuickDraw GX installation, otherwise the Type 1 screen and printer fonts are left unprocessed in the Fonts folder.

QUESTION: Are the QuickDraw GX-modified fonts which are trashed during De-installation from the removed Fonts folder?

ANSWER: They are not "trashed" -- the originals are moved back as explained in the previous answer.

QUESTION: What if non-QuickDraw GX-converted fonts are in the System Folder's Fonts folder?

ANSWER: If there are "non-converted" screen and printer Type 1 fonts in the Fonts folder when the de-install takes place, they are left alone. The only fonts deleted are the "converted" Type 1 fonts in the Fonts folder.

QUESTION: Is this process of converting the fonts the same as the Type 1 Enabler program?

ANSWER: Yes.

QUESTION: How are the fonts modified?

ANSWER: A totally new font is created from the screen and printer Type 1 fonts. Basically, the screen font is duplicated and the Type 1 data is added to the new font.

Color StyleWriter Pro: Watermark, N-up, Desktop Printing (7/95)

Revised: 7/17/95
Security: Everyone

Color StyleWriter Pro: Watermark, N-up, Desktop Printing (7/95)

=====

Article Created: 17 July 1995

TOPIC -----

We have several Color StyleWriter Pro printers. We would like to use some of the new features that are included with the new print drivers for the StyleWriter 1200, 2200 and 2400. My questions are:

1. Will any of these drivers work on a Color StyleWriter Pro and allow the use of Desktop Printing, WaterMarking and N-up printing? If so, which driver?
2. Is this a supported solution?

DISCUSSION -----

None of the new drivers will work with the Color StyleWriter Pro. Watermark and N-up features are built in to these specific drivers so those functions are not available for the Color StyleWriter Pro.

However, you can use your original Color StyleWriter Pro print driver and still get desktop printing capability. The desktop printing software is backward compatible with and supported on any Apple print driver that uses PrintMonitor.

The desktop printing software is not currently available separately. However, it is included with the LaserWriter 8.3 software. The software is also included in the original disk sets of the StyleWriter 1200, 2200, and 2400 printers.

NOTE:

Desktop printing REQUIRES Finder version 7.1.3 or greater to operate, thus requiring Systems 7.1.1 or greater.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Color LaserWriter 12/600 PS: 4-Pass and 1-Pass Printing (7/95)

Revised: 7/17/95
Security: Everyone

Color LaserWriter 12/600 PS: 4-Pass and 1-Pass Printing (7/95)

Article Created: 17 July 1995

TOPIC -----

When I print a grayscale picture on the Color LaserWriter 12/600 PS, I notice that the printer still uses the four-pass printing mode. Why is this, and is there any way around this? Also, what does the printer look for when determining if it is going to use the single-pass or four-pass mode?

DISCUSSION -----

Four-pass printing (which uses all the cartridges, CMYK) is not automatic when Color/Grayscale is selected in the Print dialog of the LaserWriter 8.3 driver. On the Color LaserWriter 12/600 PS, the printer controller primarily determines whether to switch between single-pass and four-pass printing modes. It does this by parsing the PostScript input stream for any "color information". If found, the printer is placed into four-pass mode by the controller. The following should help in characterizing the manner in which the Color LaserWriter 12/600 PS is placed into four-pass mode:

The Color LaserWriter 12/600 PS WILL be placed into four-pass mode IF:

- The document to be printed contains a bitmapped image, black and white or color (in other words, if the PostScript "image" operator is used).

It would take an enormous amount of "processing" time in the printer to look at the bitmapped data to check for any color information.

- The document to be printed contains one or more non-black pixels.

If the entire page has only black and white data, but there is one color pixel in the page, then the printer will go to four-pass mode.

- An EPS file being printed contains any references to color usage.

If the EPS file uses PostScript "color operators" such as "setcmyk", the printer

will go into four-pass mode even if "Black and White" is selected in the driver.

- The document to be printed is a Legal-sized page, and there is only 12 MB of RAM in the printer.

An exception to this occurs if only black and white text is being printed. In that case, the printer will use single-pass mode. Otherwise, the reasoning for going into four-pass mode is strictly for less memory usage.

- An application uses anything other than the PostScript "setgray" operator.

Color LaserWriter 12/600 PS: Duplex Printing Not Supported (7/95)

Revised: 7/17/95
Security: Everyone

Color LaserWriter 12/600 PS: Duplex Printing Not Supported (7/95)

=====

Article Created: 17 July 1995

TOPIC -----

Can I print on both sides of the paper using a Color LaserWriter 12/600 PS?

DISCUSSION -----

Duplex printing is not supported on the Color LaserWriter 12/600 PS. Using duplex printing can cause complications with the printer.

The toner material, if already applied and fused to the paper, can become sticky if passed through the fuser assembly again. It could then possibly adhere itself to the heater rollers in the fuser making it very difficult to remove. Damage to the fuser's heater rollers is possible.

Once the paper passes through the fuser assembly, and moisture is evaporated from it by the fuser's heater bulbs, the paper may tend to curl slightly. This may also cause potential paper jams or misfeeds.

Color LaserWriter: Changing Communications Settings (8/96)

Revised: 8/28/96
Security: Everyone

Color LaserWriter: Changing Communications Settings (8/96)

Article Created: 17 July 1995
Article Reviewed/Updated: 28 August 1996

TOPIC -----

How do I change the communications settings on my Color LaserWriter 12/600 PS?
Is that the purpose of the toggle switch on the back of the printer?

DISCUSSION -----

You can adjust many of the Color LaserWriter 12/600 PS communication settings. Though the standard (factory default) communication settings work well for most environments, you might want to customize communication settings to turn off network interfaces you do not need. For example, if you know the printer will never receive a NetWare message over the network, you can turn off the interface and stop the printer from sending out unnecessary NetWare packets.

There is a small toggle switch on the back of the Color LaserWriter 12/600 PS. It is located on the right of the I/O board on the top rear of the printer, has a solid square box to the left of it and an outlined box to the right. Using this switch and the Apple Printer Utility, you can change the default communications settings of the printer.

When the switch is set to the right, the Apple Printer Utility can be used to change the default settings. However, when the switch is set to the left, settings cannot be changed. Settings for some of the options, such as the startup page for example, are not affected by the position of the switch.

If you attempt to change the settings while the switch is in the left position, you get a message stating that some settings will not be saved on the next power cycle.

To reset the printer to the default settings, use the Printer Utility and click on the Set Defaults option. If you do not have access to the Printer Utility, move the switch to the left, and restart the printer. Keep the switch in this position while the printer starts up. Then, move the switch back to the right to

change the settings. Moving the switch while the printer is on does not harm the printer. Resetting the switch will not erase the IP number assigned through a printer utility.

This article was published in the "Information Alley":
Volume II, Issue 9, Page 18

QuickDraw GX 1.1.2: Desktop Printer Icons Won't Stay Put (8/95)

Revised: 8/28/95
Security: Everyone

QuickDraw GX 1.1.2: Desktop Printer Icons Won't Stay Put (8/95)

Article Created: 17 July 1995
Article Reviewed/Updated: 28 August 1995

TOPIC -----

It appears that the latest QuickDraw GX 1.1.2 does not retain the positions of the desktop printer icons on the Finder Desktop like QuickDraw GX 1.1.1 did. How can I fix this?

DISCUSSION -----

This is a known problem with QuickDraw GX 1.1.2, and will be fixed in the next major release of QuickDraw GX.

Workaround

Fortunately, there is a quick workaround for this problem. Follow these steps:

Step 1

Starup with Extensions off.

Step 2

Move the desktop printer icons to where you want them on the desktop.

Step 3

Restart

The desktop printers should remain where you have placed them.

Power Macintosh: Composite DIMMs Not Recommended? (7/95)

Revised: 7/18/95
Security: Everyone

Power Macintosh: Composite DIMMs Not Recommended? (7/95)

=====

Article Created: 18 July 1995

TOPIC -----

I know there was an issue with composite SIMMs and Power Macintosh computers. I was wondering if there was a similar issue concerning Power Macintosh computers using Composite or Non-Composite DIMMs.

DISCUSSION -----

Apple does not recommend or support composite DIMMs in any Macintosh model which uses 168-pin DIMMs.

Composite DIMMs, like composite SIMMs, are made up of lower-density components to construct a single bank of memory. Combining multiple chips to achieve a larger sum of memory can load down the signal to a point where the signal becomes unreliable.

Apple's Developer Note states the following:

The number of DRAM devices in a RAM DIMM for the Power Macintosh 9500 computers is constrained by the load limits of the unbuffered signals. On each DIMM, a maximum of two devices can be connected to each data line and a maximum of eight devices can be connected to each /RAS line.

DIMMs used with Apple's products are to meet the following JEDEC Joint Electron Device Engineering Council standards. Its mechanical design is defined by the MO-161 specification published by the JEDEC JC-11 committee; its electrical characteristics are defined by the JEDEC Standard No. 21-C.

Power Macintosh 9500 Series: Memory Questions & Answers (1/96)

Revised: 1/24/96
Security: Everyone

Power Macintosh 9500 Series: Memory Questions & Answers (1/96)

=====

Article Created: 18 July 1995
Article Review/Updated: 24 January 1996

TOPIC -----

The following is a list of common questions and answers (Q&A) concerning the new type of RAM, DIMMs (Dual Inline Memory Modules) used in the Power Macintosh 9500 series computers.

Questions Answered in this Article:
=====

1) How many SIMM (Single Inline Memory Module) slots are available in the Power Macintosh 9500 computers?

2) What are the sizes and specifications of the DIMMs that I can use in the Power Macintosh 9500?

3) Is the 16 MB standard configuration of these computers using up any slots or is the RAM soldered onto the logic board?

4) Does memory (DIMMs) have to be installed in pairs?

5) Are there any guidelines I should follow if I want to take advantage of memory interleaving?

DISCUSSION -----

1) Question: How many SIMM (Single Inline Memory Module) slots are available in the Power Macintosh 9500 computers?

Answer: There are no SIMM slots in the Power Macintosh 9500 computers. Memory expansions slots on the Power Macintosh 9500 are called Dual Inline Memory Module (DIMM) slots, not SIMM slots. There are 12 DIMM slots total in the Power Macintosh 9500.

2) Question: What are the sizes and specifications of the DIMMs that I can use in the Power Macintosh 9500?

Answer: Your computer can use any DRAM configuration with DIMMs of these sizes: 8, 16, 32, or 64 MB. The exact configuration depends on the density of the DRAM chips that are mounted on the DIMMs. (The DIMMs support both 2K and 4K refresh rates.)

You can increase you computer's DRAM to up to 768 MB using 16-megabit (Mbit) DRAM technology. The main logic board has 12 slots (each with a 64-bit data bus) where DIMMs can be installed.

Note: The Power Macintosh 9500 series is designed to expand to a DRAM capacity of up 1.5 gigabyte (GB) using 128 MB DIMMs. However, these DIMMs are not currently readily available and have not been tested by Apple Computer, Inc. for use in the Power Macintosh 9500 series computers.

****IMPORTANT****

The DIMMs should be 5-volt, 64-bit-wide, 168-pin fast-paged mode, with 70-nanosecond (ns) RAM access time or faster. DIMMs taller than 1.25 inches cannot fit in to the Power Macintosh 9500 computer. The Single Inline Memory Modules (SIMMs) from older Macintosh computers are not compatible with the 9500 and cannot be used.

3) Question: Is the 16 MB standard configuration of these computers using up any slots or is the RAM soldered onto the logic board?

Answer: The Power Macintosh 9500 series computers come standard with 16 MB of memory. Since there is no memory soldered on to the logic board Apple currently configures the computer with either two 8 MB DIMMs or one 16 MB DIMM depending on availability.

4) Question: Does memory (DIMMs) have to be installed in pairs?

Answer: Unlike the original Power Macintosh computers, the Power Macintosh 9500 DIMMs do not have to be installed in pairs. If you decide to have additional DRAM installed in your computer, the DIMMs can be installed one-at-a-time in any order in any of the memory slots.

However, if you intend to take advantage of the increase in performance that memory interleaving offers, you will need to install the DIMMs in identical pairs. With memory interleaving you can see up to an 8% increase in performance depending on various factors including the applications being used.

One of the main reasons that the SIMMs have to be installed in pairs on the original Power Macintosh computers is that the 72-pin SIMMs used in those computers are 32-bit wide SIMMs. However, the data buses of the Power Macintosh computers prior to the 9500 series are 64-bits wide. Thus you have to install two SIMMs to accommodate the 64-bit wide data bus.

The Power Macintosh 950, on the other hand, uses 168 pin, 70ns or faster DIMMs which are 64-bit wide. Therefore, it only takes one DIMM to meet the 64 bit wide data bus requirement, and you only have to install one DIMM at a time.

5) Question: Are there any guidelines I should follow if I want to take advantage of memory interleaving?

Answer: if you wish to take advantage of the Power Macintosh 9500 series computers' memory interleaving capability, which provides maximum performance, you must have the DIMMs installed in pairs, and in paired slots. (A1 and B1 are the first pair of slots, A2 and B2 are the second, and so on.) Memory interleaving allows the computer to read or write its memory while other memory reads or writes are occurring, thus providing faster performance.

Paired DIMMs should be the same size and speed. DIMMs purchased for different manufacturers can be paired as long as they are the same size and speed.

Article Change History:

24 Jan 1996 - Added information about memory interleaving and revised format.

08 Aug 1995 - Added information about size of DIMMs included.

28 Jul 1995 - Added explanation on number of DIMM slots

Power Mac 7500,7600,8500,9500 Series: SCSI-2 Compliance (2/97)

Revised: 2/26/97
Security: Everyone

Power Mac 7500,7600,8500,9500 Series: SCSI-2 Compliance (2/97)

Article Created: 5 July 1995
Article Reviewed/Updated: 26 February 1997

TOPIC -----

This article contains the answers to questions about the SCSI (Small Computer Systems Interface) buses in the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers.

Questions Answered in this Article:
=====

- 1) How many SCSI buses do the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers have?
- 2) What are the speeds of the SCSI buses?
- 3) How many SCSI devices can I attach to these computers internally?
- 4) How many SCSI devices can I attach to these computers externally?
- 5) Does one SCSI bus have precedence over the other?
- 6) Is the external SCSI port SCSI-2 or Fast SCSI-2?
- 7) Is our MESH Fast SCSI controller fully compliant with the SCSI-2 'Fast' specification as defined in the SCSI-2 spec?
- 8) Since the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers are SCSI-2 compliant will we see better SCSI performance?
- 9) Did Apple implement SCSI disconnect/reconnect?
- 10) Will third-party manufacturers be able to optimize their equipment to take advantage of Fast SCSI-2?

11) If I remove the internal Apple hard drive, is the internal SCSI bus terminated or not?

12) Are the internal hard drives included with the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers Fast SCSI devices?

13) What is meant by "dual-channel asynchronous SCSI"? How does this affect the internal SCSI termination on these computers?

DISCUSSION -----

1) Question: How many SCSI buses do the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers have?

Answer: There are two SCSI buses on the Power Macintosh Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers. There is an internal bus and an external bus.

2) Question: What are the speeds of the SCSI buses?

Answer: The internal bus has a maximum transfer rate of 10 MB/sec. The external bus has a maximum transfer rate of 5 MB/sec.

3) Question: How many SCSI devices can I attach to these computers internally?

Answer: There is a connector for the external bus inside the computer on the logic board, however, it is generally easier to simply hook internal devices to the internal bus.

There are 4 drive bays inside the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers but one is used by the floppy drive. If your computer has a hard drive and CD-ROM drive you will have room for one more internal SCSI device for a maximum of three (3) on the internal SCSI chain due to physical constraints.

4) Question: How many SCSI devices can I attach to these computers externally?

Answer: The external bus can have up to 7 SCSI devices attached to it. Make sure that you do not exceed the maximum cable length (6 meters or 20 feet) including the cables inside the devices. Additionally all SCSI devices must be powered on when your Macintosh is on.

5) Question: Does one SCSI bus have precedence over the other?

Answer: Because you can have two SCSI devices at the same SCSI address (one on each bus) the internal bus (all addresses) is set up to take precedence over the external bus. For startup drives the setting in the Startup Disk control panel is used.

6) Question: Is the external SCSI port SCSI-2 or Fast SCSI-2?

Answer: The external SCSI channel on the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers is SCSI-2 compliant but does not support Fast SCSI-2. The external SCSI channel supports the SCSI-2 standard at 5 MB per second. The internal SCSI channel supports the Fast SCSI-2 standard at 10 MB per second for a hard disk array. Both internal and external buses are 8-bit only, not wide.

7) Question: Is the MESH Fast SCSI controller fully compliant with the SCSI-2 'Fast' specification as defined in the SCSI-2 spec?

Answer: The Fast mode is completely SCSI-2 compliant.

8) Question: Since the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers are SCSI-2 compliant will we see better SCSI performance?

Answer: By itself, SCSI-2 does not mean added performance, although, generally speaking SCSI-2 products are newer and tend to be faster just because they take advantage of the latest software and hardware advances. Optional SCSI-2 modes like 'FAST' and 'WIDE' offer improved SCSI performance.

9) Question: Did Apple implement SCSI disconnect/reconnect?

Answer: Yes, Apple implemented disconnect/reconnect per the SCSI-2 standard.

10) Question: Will third-party manufacturers be able to optimize their equipment to take advantage of Fast SCSI-2?

Answer: Apple cannot comment on the compatibility of third-party products. Please check with the manufacturer of your third-party products for compatibility with the Fast SCSI-2 standard on the internal SCSI channel of these Power Macintosh computers.

11) Question: If I remove the internal Apple hard drive, is the internal SCSI bus terminated or not?

Answer: The Apple internal drive supplies termination to the internal SCSI bus when it ships from the factory. If the drive is removed and another drive is installed, then that drive should be terminated. If no drive is installed on the internal SCSI bus, then the ribbon cable should be removed from the logic board to prevent problems with termination.

12) Question: Are the internal hard drives included with the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers Fast SCSI devices?

Answer: Yes, the internal hard disks shipped with the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 are Fast SCSI devices capable of up to 10 MB per second transfer rates.

14) Question: What is meant by "dual-channel asynchronous SCSI"? How does this affect the internal SCSI termination on these computers?

Answer: Computers with dual-channel asynchronous SCSI have a single SCSI controller which manages SCSI communications across two separate SCSI buses: an internal/external SCSI bus (Bus 1) and an internal SCSI bus (Bus 0).

There are no devices attached internally to Bus 1 in Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers.

Bus 1 has automatic termination, which means that circuitry on the logic board senses whether or not there are any external SCSI devices attached. If there are no external SCSI devices connected, the logic board automatically terminates itself at the 50-pin logic board connector, thus terminating both ends of the SCSI chain.

Once an external SCSI device is connected to the 25-pin external connector, the circuitry senses the device and disables termination at the 50-pin logic board connector. The computer then relies on the external SCSI device to provide the proper termination.

Bus 0 is a completely separate SCSI bus with its own SCSI controller. In Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers, Bus 0 provides Fast SCSI communications up to 10 MB per second.

This bus has a 50-pin flat ribbon cable with two 50-pin connectors on it. Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 series computers ship with the internal hard drive and CD-ROM drive connected to this SCSI bus. The internal hard drive is terminated, which terminates the SCSI bus.

Unlike Bus 1, Bus 0 does not have automatic termination because it is exclusively an internal SCSI bus. If additional devices are added to Bus 0, only the last device should contain termination resistors.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

Color StyleWriter 2400: Installing LocalTalk Option (7/95)

Revised: 7/28/95
Security: Everyone

Color StyleWriter 2400: Installing LocalTalk Option (7/95)

=====

Article Created: 18 July 1995
Article Reviewed/Updated: 28 July 1995

TOPIC -----

This article describes the Color StyleWriter 2400 LocalTalk Option (M3458LL/A).

DISCUSSION -----

The Color StyleWriter 2400 LocalTalk Module allows Color StyleWriter 2400 users to connect their printers directly to LocalTalk networks, thereby eliminating the need for a dedicated host, as is necessary with ColorShare. The LocalTalk Module is user installable; it plugs directly into the printer's serial port.

This procedure covers the installation of the optional LocalTalk module, which enables the printer to connect to a LocalTalk network.

- Using a small flat-blade screwdriver, release the mounting tab and remove the interface cover from the rear case.
- Plug the LocalTalk connector into the serial port on the printer.
- Insert the upper edge of the LocalTalk module into the rear case of the printer, and then snap the bottom into place.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Article Change History:
28 Jul 1995 - Added part number.

Revised: 7/19/95
Security: Everyone

Imaging: Glossary of Terms (7/95)

=====

Article Created: 19 July 1995

TOPIC -----

This article describes some of the common terms used when discussing imaging technology.

DISCUSSION -----

1 bit

A bit is the smallest quantity of data. One bit of information can have two possible values: 1 or 0.

4 bits

4 bits of information have 16 possible values.

Application Programming Interface - An architecture that allows applications and drivers to request functions from a specific program or system extension.

ASIC

Stands for Application Specific Integrated Circuit. ASICs are designed to either reduce cost by putting many functions in one piece of silicon or improve performance by putting software functionality into hardware.

Bilevel data

Data that represents objects that have one of two states: typically black or white. Text and line art are examples of bilevel data.

Binary data

Objects that are represented by combinations of 1s and 0s. The other common form of data is ASCII, where objects are described by a combination of numbers and letters.

Bitmap

A pixel-by-pixel representation of an object.

CIE Committee

Commission International de l'Eclairage (International Commission on Illumination).

CIE XYZ and LaB

Device-independent color spaces defined by the CIE committee.

CMYK

Cyan, Magenta, Yellow and black. The three subtractive primary colors, plus black make the process printing colors.

Color Electronic Publishing Systems, or CEPS

Computer-based systems for inputting, manipulating, assembling and outputting data, both color and black and white, in various forms of media. Examples are from Linotype, Scitex, and Crosfield.

Color Management System

A system for communicating color fidelity across devices, such as input, display, and output devices.

Color Matching Method

The routine used by a color management system to apply transformations to color data.

Color separation

The process of separating color into the primary process colors in preparation for printing.

Color space

A set of parameters that describe color values, such as RGB (red, green, blue) or CMYK (cyan, magenta, yellow, black).

Colorants

The colors used by a color device to reproduce color. A printing press uses the CMYK colorants.

Continuous tone

An image that has no apparent steps between one shade and the next.

Controller

A circuit board that controls what the print engine outputs.

Decompress

The process of restoring a compacted version of an object to its full size.

Device calibration

The process of adjusting a device to compensate for differences due to manufacturing, age, environmental conditions, and media inconsistencies.

Device characterization

The process of creating a device profile, which involves measuring colors with a highly sensitive measuring device.

DPI

Dots per inch; the number of dots that can be placed horizontally and vertically. This is also known as printer resolution.

Fat Binary

An application that supports both PowerPC and 68000 processors.

Gamma

The overall darkness of a gray ramp.

Gamut

The range of colors that a device can reproduce.

Gamut mapping

The process of altering a color so that it can be reproduced on a particular device.

Gray

The intensity of a black-and-white object.

Grayscale

A range of gray levels.

Halftone

The process of converting multilevel data into bilevel data.

Halftone cell

The pattern of white-and-black pixels that is repeated.

Halftone screen

See halftone cell

Halftone screen dot

The black portion of the halftone cell. The most common halftone cells grow from the center so a "dot-like" structure is formed as darker grays are formed.

Halftone screen elements

The pixels that make up the halftone cell.

Halftone screen pattern

The shape that all of halftone elements form when combined.

Halftone screen (line screen)

A term to describe how many lines (dots) of resolution are available with a particular halftone cell. For example on a 300-dots-per-inch printer, a 3 x 3 halftone cell at 0 degrees gives a 100-dots-per-inch halftone screen. This can be calculated by dividing the resolution of the printer by the number of elements in the halftone cell.

Hi-Fi color process

The use of more than the four basic colors in the printing process to produce more vibrant color.

ICC profile

A cross-platform standard used to represent the color capabilities of device.

Ideal edge

The line the high-definition ASIC calculates to be the best edge for a particular segment of text or line.

Images

The term used to describe multibit scanned data.

Intermediate gray levels

Gray levels obtained by turning on less than a 300-dots-per-inch pixel.

International Color Committee (ICC)

A committee formed in 1993 to establish standards for electronic color publishing. The first standard is the ICC profile, which is a cross-platform specification for color management profiles.

Line screen

See halftone screen.

Lines per inch

Same as line screen.

Linear toner response

See grayscale linearity.

Multibit data

Objects that contain more than one bit of information (color or gray) per pixel.

Page buffer

Printer memory set aside to store the image prior to sending it to the laser printer.

Photosensitive drum

A cylinder coated with a material that holds a charge when exposed to light. A photosensitive drum is what the laser strikes in the toner cartridge of a laser printer.

Pixel

The smallest area that can be addressed in both the horizontal and vertical direction.

PostScript

A language that is used to described graphic objects. A PostScript interpreter is software that executes a PostScript language program and turns the description of an object into bits in a frame buffer.

Process colors

The four primary colors used in the printing process. These are CMYK (Cyan, Magenta, Yellow, and Black).

Profile

A file containing the color reproduction capabilities of a given input, display, or output device. Color management systems use profiles to interpret color data between devices.

Pulse

The term used to describe turning on the laser beam for a period of time. The laser can be pulsed for each pixel. With high definition, the laser is pulsed for a shorter period of time (or multiple times) to turn on less than one whole pixel.

Rendering styles

The method in which color is reproduced, taking into consideration the intent of the color. For example, photographic colors require less saturated rendering than business graphics do.

RET (Resolution Enhancement Technology)

Hewlett-Packard's technique to rapidly pulse the laser to smooth the edges of fonts and lines. RET is included in the Hewlett-Packard LaserJet III printer.

RGB

The additive colors Red, Green, and Blue. Combined, these colors make white and are usually used in color displays.

Screen angle

The angle at which the halftone cell repeats. Typically 45-degree halftone cells are used because they mask banding that the eye picks up with zero-degree cells.

Screen frequency

See line screen.

Simulation

Using one device to predict the results another device, usually a printing device.

Spectrophotometers

A device that measures the wavelength of a color.

Spot colors

Colors used in printing that are not part of the process ink set. These are usually used in addition to the process colors. Examples are Pantone, Toyo, and Focoltone.

Toner

The substance that is used in laser printers to form the black dots.

No Computer Sound Troubleshooting Steps (7/95)

Revised: 7/19/95
Security: Everyone

No Computer Sound Troubleshooting Steps (7/95)

Article Created: 19 July 1995

TOPIC -----

What could be causing my computer to not play sounds?

DISCUSSION -----

Step 1

Check the volume in the Sound control panel to make sure the volume is not turned all of the way down.

Step 2

Check to see if anything (such as a microphone) is plugged into the speaker port on the back of your computer. If you have a microphone, it must be connected to the microphone port and not to the speaker port. If you have external speakers connected, disconnect them and see if your computer will play sounds through the internal speaker. Having anything connected to the speaker port will automatically disable the internal speaker. If your computer will play sounds with nothing connected to the speaker port, you will need to examine your speakers.

Step 3

If you still cannot hear any sound and have nothing connected to the speaker port, you should reinstall your system software. If reinstalling system software does not resolve your issue, contact an Apple authorized service provider. You may locate one in your area by calling 800-538-9696.

Power Macintosh 9500: Pinouts (7/95)

=====

Article Created: 19 July 1995

TOPIC -----

This article presents the pinouts for Power Macintosh 9500 series computers. These pinouts include: ADB, GeoPort, SCSI, a floppy disk drive, built-in Ethernet, high-quality 16-bit stereo sound, and various levels of monitor support depending on the model.

DISCUSSION -----

Apple Desktop Bus (ADB)

One connector is located on the back panel of Power Macintosh computers. It is a 4-pin mini-DIN socket.

Pin	Description
---	-----
1	Data; grounded by an open collector or pulled to +5 V through 470
2	Power on, fed by +5 V through 100 k ; connect to pin 4 to turn on the system
3	+5 V at 500 mA maximum drain; protected by a 1.25-A circuit breaker
4	Ground return

Ethernet

All models of Power Macintosh contain built-in Ethernet. The 9500's offer two types of connection.

One AAUI-15 Ethernet connector

Pin	Description	Pin	Description
---	-----	---	-----
1	+5 V	8	+5 V
2	DI+	9	DO+

3	DI-	10	DO-
4	Ground	11	Ground
5	CI+	12	No Connection
6	CI-	13	No Connection
7	+5 V	14	+5 V

And One 10Base-T Ethernet connector (NOTE: If both 10BASE-T and AAUI connectors are plugged in, the computer uses the 10BASE-T connector by default.)

The pin configurations for 10BASE-T are as follows:

Contact:	Signal:
1	TD+
2	TD-
3	RD+
4	Not Used by 10BASE-T
5	Not Used by 10BASE-T
6	RD-
7	Not Used by 10BASE-T
8	Not Used by 10BASE-T

Serial Ports

The back panel of all Power Macintosh models contain two I/O ports for serial telecommunication data. Both sockets accept 9-pin plugs allowing either port to be independently programmed for asynchronous or synchronous communication formats up to 9600 bps. This includes AppleTalk and the full range of Apple GeoPort protocols.

Pin	Name	Function
1	SCLK(out)	Reset pod or get pod attention
2	Sync(in)/SCLK(in)	Serial clock from pod (up to 920 Kbit/sec.)
3	TxD-	Transmit -
4	Gnd/shield	Ground
5	RxD-	Receive -
6	TxD+	Transmit +

7	Wakeup/TxHS	Wake up CPU or do DMA handshake
8	RxD+	Receive +
9	+5 V	Power to pod (350 mA maximum)

SCSI Connection

The SCSI interface in Power Macintosh computers exists in two forms: an internal 50-pin ribbon connector for internal devices and an external DB-25 connector for external devices.

Pin Number		Description	Pin Number		Description
-----		-----	-----		-----
Internal	External		Internal	External	
1	7	Ground	2	8	/DATA0*
3	9	Ground	4	21	/DATA1
5	14	Ground	6	22	/DATA2
7	16	Ground	8	10	/DATA3
9	18	Ground	10	23	/DATA4
11	24	Ground	12	11	/DATA5
13		Ground	14	12	/DATA6
15		Ground	16	13	/DATA7
17		Ground	18	20	/DATAP
19		Ground	20		No connection
21		Ground	22		No connection
23		Ground	24		No connection
25		No connection	26	25	TERMPWR
27		Ground	28		No connection
29		Ground	30		No connection
31		Ground	32	17	/ATN
33		Ground	34		No connection
35		Ground	36	6	/BUSY
37		Ground	38	5	/ACK
39		Ground	40	4	/RST
41		Ground	42	2	/MSG
43		Ground	44	19	/SEL
45		Ground	46	15	/C/D
47		Ground	48	1	/REQ
49		Ground	50	3	/I/O

* A slash (/) before a signal name indicates that it is in the low state when active.

Floppy Disk Drive Connection

All Power Macintosh models contain one internal Apple superDrive floppy disk drive, which supports GCR and MFM formats for 1.44 MB disks.

Pin	Signal	Description	Pin	Signal	Description
---	-----	-----	---	-----	-----
1	GND	Ground	11	+5 V	+5 V
2	PH0	Phase 0 state control	12	SEL	Head select
3	GND	Ground	13	+12 V	+12 V

4	PH1	Phase 1 state control	14	/ENBL*	Drive enable
5	GND	Ground	15	+12 V	+12 V
6	PH2	Phase 2 state control	16	RD	Read data
7	GND	Ground	17	+12 V	+12 V
8	PH3	Phase 3 register write strobe	18	WR	Write data
9	NC	No connection	19	+12 V	+12 V
10	/WRREQ	Write data request	20	NC	No connection

* A slash (/) before a signal name indicates that it is in the low state when active.

Monitor Support

The Power Macintosh 9500/120 includes an accelerated display card based on the mach64 graphics accelerator from ATI Technologies, Inc.

Pin	Description	Pin	Description
---	-----	---	-----
1	Red ground	9	Blue video signal
2	Red video signal	10	Monitor sense 2
3	Composite synchronization	11	Synchronization ground
4	Monitor sense 0	12	Vertical synchronization
5	Green video signal	13	Blue ground
6	Green ground	14	Horizontal synchronization ground
7	Monitor sense 1	15	Horizontal synchronization
8	No connection		

The Power Macintosh 9500/132 requires a third-party (non-Apple) graphics accelerator for display support.

Sound I/O

All Power Macintosh computers contain external stereo 3.5mm jacks for sound I/O, connected through amplifiers to the AWAC chip.

Panel label	Description
-----	-----
Audio In	8 k impedance, 2 V rms maximum, 22.5 dB gain available
Audio Line Out	37 impedance, 0.9 V rms maximum, attenuated -22,5 dB (crosstalk degrades from -80 to -32 dB when the audio output is connected to 32 headphones)

Power Macintosh: Apple Accelerated Graphics Card Pinouts (7/95)

Revised: 7/19/95
Security: Everyone

Power Macintosh: Apple Accelerated Graphics Card Pinouts (7/95)

=====

Article Created: 19 July 1995

TOPIC -----

This article presents the pinouts for the Apple Accelerated Graphics Card available in the Power Macintosh 9500/120 computer.

DISCUSSION -----

The Apple Accelerated Graphics Card is based on the mach64 Graphics Accelerator card from ATI Technologies, Inc.

Pin	Description	Pin	Description
---	-----	---	-----
1	Red ground	9	Blue video signal
2	Red video signal	10	Monitor sense 2
3	Composite synchronization	11	Synchronization ground
4	Monitor sense 0	12	Vertical synchronization
5	Green video signal	13	Blue ground
6	Green ground	14	Horizontal synchronization ground
7	Monitor sense 1	15	Horizontal synchronization
8	No connection		

Note:

The Power Macintosh 9500/132 computer does not come with the Apple Accelerated Graphics Card. It requires a third-party (non-Apple) graphics accelerator for display support.

Power Macintosh 9500/120: Portrait Monochrome Display (12/95)

Revised: 12/12/95
Security: Everyone

Power Macintosh 9500/120: Portrait Monochrome Display (12/95)

Article Created: 19 July 1995
Article Reviewed/Updated: 12 December 1995

TOPIC -----

Does the video card that comes pre-installed in the Power Macintosh 9500/120 support the Apple Portrait Display? If so, does the card support 256 shades of gray?

DISCUSSION -----

The Apple portrait display (Monochrome 15-in. display) is supported by the Power Macintosh 9500/120 Apple Accelerated Graphics Card (ATI). The Technical Specification booklet which came with the computer lists the Portrait Display incorrectly as an RGB monitor. The color depth is also incorrect for both memory configurations.

The proper listing should be:

Monitor	Resolution	Max Colors	Max Colors
		2 MB	4 MB
-----	-----	-----	-----
15-in Portrait monochrome	640x870	8bpp (256 shades)	8bpp (256 shades)

Article Change History:
12 Dec 1995 - Corrected type of display in topic area.

LaserWriter Pro 630: Not Appearing on Novell 4.1 Network (7/95)

Revised: 7/19/95
Security: Everyone

LaserWriter Pro 630: Not Appearing on Novell 4.1 Network (7/95)

=====

Article Created: 19 July 1995

TOPIC -----

Our Novell server was just recently upgraded from NetWare 4.0.2 to 4.1. Since the upgrade, I am no longer able to see any of the LaserWriter 630 printers on the network even though other printers appear normally. The LaserWriter 630 printers do not appear using ATCON, nor do they appear from the Macintosh clients. What is causing this?

DISCUSSION -----

This situation can occur when NetWare OS versions are upgraded, but the Network Interface Card (NIC) driver on the NetWare server is not the current version. The upgrade from NetWare 4.0.2 to 4.1 involved a number changes to the Appletalk protocol stack and the network interface ODI and supporting NLM's (NetWare Loadable Module), which may require an updated driver. The network interface card manufacturer should be contacted to obtain the most current driver. You should also verify that the driver supports NetWare 4.1.

LaserWriter 360f: FAX Speed Unrelated to RAM Size (7/95)

Revised: 7/19/95
Security: Everyone

LaserWriter 360f: FAX Speed Unrelated to RAM Size (7/95)

=====

Article Created: 19 July 1995

TOPIC -----

How does the amount of RAM affect the faxing capabilities of LaserWriter 360f?
Will more RAM allow this printer to send faxes faster (by imaging them faster)?

DISCUSSION -----

Adding RAM will not significantly increase the speed of Fax jobs. Please note that in the tests we ran it seems to have run "slightly" faster with 16 MB. However, when you take into consideration switched phone lines and retries to the printer the time differences noted are insignificant.

Here are the results of the benchmark test.

Test 1 - 1 page document
=====

	From Start to dial tone	From Dial Tone to EOJ
7 MB	1 Minute 15 seconds	39 seconds
16 MB	1 Minute 5 seconds	38 seconds

Test 2 - 5 page document
=====

	From Start to dial tone	From Dial Tone to EOJ
7 MB	3 Minute 19 seconds	2 Min 46 seconds
16 MB	3 Minute 15 seconds	2 Min 46 seconds

Grolier's Encyclopedia: Map and Timeline Issues (1/96)

Revised: 1/4/96
Security: Everyone

Grolier's Encyclopedia: Map and Timeline Issues (1/96)

Article Created: 19 July 1995
Article Reviewed/Updated: 4 January 1996

TOPIC -----

I have a Macintosh Performa computer, which included the Grolier's Multimedia Encyclopedia '95 CD. However, the Maps and Timelines do not display on my computer.

DISCUSSION -----

This issue is documented in the 1995 Grolier Multimedia Encyclopedia Read Me file, which is included on the CD. If you have a Power Macintosh computer set to display in 256 colors, you may not see the timelines or maps. In order to properly view the CD on a Power Macintosh computer, the Monitors control panel must be set to thousands of colors or higher.

Note that with a multiple scan display if you have the monitor set at a high resolution, you can display fewer colors. If you view at a lower resolution, you can display more colors. So, you may need to change the resolution in order to view in thousands of colors. Follow these steps to change the number of colors being displayed:

Step 1

Open the Monitors control panel.

1. If Thousands is an option, select it, and close the Monitors control panel. You should be able to view the timelines and maps.

2. If Thousands is not an option, follow Step 2.

Step 2

Click on the Options button.

Step 3

Note what the current monitor setting is and try the next lower resolution. For example, if it is set to 832 x 624, try 640 x 480. Click on the OK button.

Step 4

1. If you can then select thousands, follow Step 5.

2. If you still cannot select Thousands, repeat Steps 2-3 until you can select Thousands.

Step 4

Once you are able to select Thousands in the Monitors control panel you should be able to view the timelines and maps. If not, contact Mindscape, the publisher of the Groliers encyclopedia, for additional assistance.

LaserWriter 7.x Driver Not Included With AppleShare 4.1 (7/95)

Revised: 7/19/95
Security: Everyone

LaserWriter 7.x Driver Not Included With AppleShare 4.1 (7/95)

=====

Article Created: 19 July 1995

TOPIC -----

I just installed System 7.5.1 and AppleShare Print Server 4.1 on my Workgroup Server 8150. I then received an error message something like, "Print server had trouble getting to the LaserWriter file. Please make sure the print drivers are installed correctly," when the server restarted. What is the problem?

DISCUSSION -----

You need the LaserWriter 7.x driver. The LaserWriter 7.x driver is not on the AppleShare 4.1 installer, and not on the System 7.5 Update 1.0 Installer.

You can find the LaserWriter 7.2 driver on the System Software 7.5 Installer by selecting Custom Install, Printing, and LaserWriter. You can also find LaserWriter 7.1.2 driver on the System Software 7.1.2 Installer, System Software 7.1 Installer, or LaserWriter II Installer v5.0 software by clicking the Custom button and scrolling to LaserWriter software.

TITLE

Apple Displays: Frequently Asked Questions

Article ID: 18216
Created: 7/19/95
Modified: 1/12/00

TOPIC

This document contains the answers to frequently asked questions (FAQ) about Apple displays.

Questions in this FAQ:

1. I have an Apple Multiple Scan 15 Display and a Macintosh IIsi and IIfx. The monitor will not work with either computer. Do I need an adapter?
2. I attached an Apple Multiple Scan Display to my computer and I am not able to switch resolutions, even though the computer I am using supports the different resolutions. What is causing this?
3. I have a monitor that uses a Sony Trinitron picture tube. About a third of the way from the top and/or bottom of the monitor, I see a very thin gray line. Is there something wrong with my monitor?
4. There is a large black border around the edge of the viewable area of my monitor and the picture does not fill the entire screen. Is there something wrong with my monitor?
5. I have a monitor experiencing one of the following symptoms:
 - a jittering or shaking picture
 - discolored areas in the picture
 - horizontal lines cycling across the screen
 - distorted image

What is causing this?

6. I purchased an Apple monitor and I cannot plug the power cable into the wall outlet. It has a shield around it that prevents this. How do I plug this monitor in?
7. I have changed some of the settings on my Apple Multiple Scan Display. How can I restore the monitor to the factory settings?
8. I connected my Multiple Scan 15 Display to my computer and I cannot get sound to play through the speakers on the monitor. Why is this?

DISCUSSION

1. **Question:** I have an Apple Multiple Scan 15 Display and a Macintosh IIsi and IIfx. The monitor will not work with either computer. Do I need an adapter?

Answer: Out of the box the Apple Multiple Scan 15 Display is not compatible with the Macintosh IIsi and IIfx. The problem is related to the sync lines. The IIfx and IIsi were designed to work with the 13-inch HighRes RGB, which uses a composite sync input. The Multiple Scan 15 Display only accepts sync on separate input lines, one for the horizontal and one for the vertical.

To use the monitor with either of these computers, you must either use a video card that is compatible with the Apple Multiple Scan 15 Display, or use a special display adapter available from some third-party companies.

Display adapters are available from several third-party companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

2. **Question:** I attached an Apple Multiple Scan Display to my computer and I am not able to switch resolutions, even though the computer I am using supports the different resolutions. What is causing this?

Answer: Many older Macintosh computers did not support resolution switching using software and require a cable adapter to produce different resolutions. Other computers do not provide the proper sync signals to work with the monitor and require an adapter to get any picture. The table below gives details for what is needed to use Apple computers with Apple Multiple Scan Displays.

The following (B revision) video cards can provide 832 x 624 resolution when used with a video adapter:

- Macintosh 4/8
- Macintosh 8/24
- Macintosh 8/24GC

The following computers do not produce the proper sync signal to produce a picture on the monitor. An adapter must be used to view a correct video signal on these computers. These computers can support a maximum 640 x 480 video signal.

- Macintosh LC
- Macintosh LC II
- Macintosh Performa 400, 405, 410, 430
- Performa 600, 600CD
- Macintosh IIfx
- Macintosh IISI
- Macintosh IICx

The following computers and video cards require a cable adapter to provide 832 x 624 resolution:

- PowerBook 180, 180c, 160, 165, 165c
- PowerBook 500 Series
- PowerBook MiniDock and DuoDock (the DuoDock does not require an adapter when used with System 7.5)
- Macintosh LC III
- Macintosh Performa 450, 460, 466, 467
- Macintosh Display Card 4*8, 8*24, and 8*24 GC

The following computers and video card do not require an adapter:

- Macintosh Quadra Series
- Macintosh Centris Series
- Macintosh LC 475
- Macintosh Performa 475 and 476
- Macintosh 630 family
- Power Macintosh Family
- Macintosh Display Card 8*24AC

Multiple Scan 17 and 20 Displays

To get higher resolutions, your computer must support that resolution. The number of colors at the various resolutions depends on the amount of Video RAM (VRAM) you have in your Macintosh.

The following computers and video cards require a cable adapter to provide different resolutions:

- Macintosh II series
- PowerBook 180, 180c, 160, 165, 165c
- PowerBook 500 Series
- PowerBook MiniDock and DuoDock (the DuoDock does not require an adapter when used with System 7.5)
- Macintosh LC, LC II, LC III
- Macintosh Performa 450, 460, 466, 467
- Macintosh Display Card 4*8, 8*24, and 8*24 GC

The following computers and video card do not require an adapter:

- Macintosh Quadra Series
- Macintosh Centris Series
- Macintosh LC 475
- Macintosh Performa 475 and 476
- Macintosh 630 family
- Power Macintosh Family
- Macintosh Display Card 8*24AC

Display adapters are available from several third-party companies such as Griffin Technology and MacAdapt.

3. **Question:** I have a monitor that uses a Sony Trinitron picture tube. About one third of the way from the top and/or bottom of the monitor, I see a very thin gray line. Is there something wrong with my monitor?

Answer: When you display a white or light background on some Apple color displays, you may notice a thin gray horizontal line or lines across the screen. These thin lines are supporting or stabilizing wires inside the CRT and are part of Sony's Trinitron CRT technology.

Sony Trinitron CRTs have a specially constructed aperture grill that improves the CRT's convergence and produces a sharp and clear image. The aperture grill is a grid of vertical wires located just behind the CRT screen. These CRTs require a horizontal stabilizing wire or wires to help support the aperture grill. The supporting wires, which are thinner than a human hair, stabilize the aperture grill against shocks.

The Macintosh 13-inch Hi-Res RGB Monitor and 14-inch Macintosh Color Display have a single support wire across the bottom third of the display. Other Apple displays that feature Sony's Trinitron or Mitsubishi's Diamondtron CRT's have two support wires visible across the top and bottom thirds of the screen.

Note: These are not screen defects. Their presence cannot be adjusted out or eliminated by repairing or replacing modules in the display.

4. **Question:** There is a large black border around the edge of the viewable area of my monitor and the picture does not fill the entire screen. Is there something wrong with my monitor?

Answer: It is normal for your monitor to have a black border around the displayed picture. The closer an image gets to the edges of a display, the lower its quality. The black border will vary in size, depending on the type of monitor you have. Some Apple displays allow you to fill most of the screen using a button on the front of the display.

5. **Question:** I have a monitor experiencing one of the following symptoms:

- a jittering or shaking picture
- discolored areas in the picture
- horizontal lines cycling across the screen
- distorted image

What is causing this?

Answer: These symptoms can all be caused by electromagnetic interference. All monitors are subject to electromagnetic interference. Larger monitors are affected more by this than smaller ones.

If your monitor is exhibiting any of the above symptoms, try temporarily moving it to a different location to check for interference. If the symptom does not occur after moving the monitor, then there was likely a source of interference in the area where the monitor was originally located.

Possible sources of electromagnetic interference include:

- other monitors
- fluorescent lights
- anything with a motor (fans, air conditioners, and so on)
- anything with a magnet (some mobile phones, speakers, and so on)

6. **Question:** I purchased an Apple monitor and I cannot plug the power cable into the wall outlet. It has a shield around it that prevents this. How do I plug this monitor in?

Answer: The power cable you are describing is designed to be connected to the power outlet on the back of your computer. Look on the back of the computer just above where the computer's power cord is connected. There will usually be a receptacle there with three prongs in it. Plug the shielded end of the monitor's power cable into this receptacle.

If your computer does not have such a receptacle (many older Macintosh models did not), you can obtain a regular power cord from most computer dealers and electronic stores. If you take the power cord you have to the location from which you purchased it, they may be able to swap it for the power cable you need.

7. **Question:** I have changed some of the settings on my Apple Multiple Scan Display. How can I restore the monitor to the factory settings?

Answer: You can restore the monitor to factory settings as follows:

- Multiple Scan 15 Display: open the front panel and press the Recall button.
- Multiple Scan 17 and 20 Displays: Open the front panel. On the extreme left, you will see a recessed button with a triangle icon over it and next to it, a button with a circle icon. Using a pen tip or something similar, hold in the button with the triangle and while holding it in, press the button with the circle.

This procedure may also help if the monitor is out-of-focus, has a tilted raster, is experiencing pin-cushioning, and so on.

8. **Question:** I connected my Multiple Scan 15 Display to my computer and I cannot get sound to play through the speakers on the monitor. Why is this?

Answer: To get computer sounds to play through the speakers of an attached Multiple Scan 15 Display, you must connect the sound out cable that came with the monitor from the sound output port on the back of your computer (the one with the speaker icon) to the sound port on the monitor.

- 5) I have a monitor experiencing one of the following symptoms:
 - A jittering or shaking picture
 - Discolored areas in the picture
 - Horizontal lines cycling across the screen
 - Distorted image

What is causing this?

- 6) I purchased an Apple monitor and I cannot plug the power cable into the wall outlet. It has a shield around it that prevents this. How do

I plug this monitor in?

- 7) I have changed some of the settings on my Apple Multiple Scan Display. How can I restore the monitor to the factory settings?
- 8) I connected my Multiple Scan 15 Display to my computer and I cannot get sound to play through the speakers on the monitor. Why is this?

DISCUSSION -----

1) Question:

I have an Apple Multiple Scan 15 Display and a Macintosh IIsi and IIfx. The monitor will not work with either computer. Do I need an adapter?

Answer:

Out of the box the Apple Multiple Scan 15 Display is not compatible with the Macintosh IIsi and IIfx. The problem is related to the sync lines. The IIfx and IIsi were designed to work with the 13-inch HighRes RGB, which uses a composite sync input. The Multiple Scan 15 Display only accepts sync on separate input lines, one for the horizontal and one for the vertical.

To use the monitor with either of these computers, you must either use a video card that is compatible with the Apple Multiple Scan 15 Display, or use a special display adapter available from some third-party companies.

Display adapters are available from several third-party companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

2) Question:

I attached an Apple Multiple Scan Display to my computer and I am not able to switch resolutions, even though the computer I am using supports the different resolutions. What is causing this?

Answer:

Many older Macintosh computers did not support resolution switching using software and require a cable adapter to produce different resolutions. Other computers do not provide the proper sync signals to work with the monitor and require an adapter to get any picture. The table below gives details for what is needed to use Apple computers with Apple Multiple Scan Displays.

The following (B revision) video cards can provide 832x624 resolution when used with a video adaptor:

- Macintosh 4/8
- Macintosh 8/24
- Macintosh 8/24GC

The following computers do not produce the proper sync signal to produce a picture on the monitor. An adapter must be used to view a correct video signal on these computers. These computers can support a maximum 640x480 video signal.

- Macintosh LC

- Macintosh LC II
- Macintosh Performa 400, 405, 410, 430
- Performa 600, 600CD
- Macintosh IIfx
- Macintosh IIsi
- Macintosh IICI

The following computers and video cards require a cable adapter to provide 832x624 resolution:

- PowerBook 180, 180c, 160, 165, 165c
- PowerBook 500 Series
- PowerBook MiniDock and DuoDock (The DuoDock does not require an adapter when used with System 7.5)
- Macintosh LC III
- Macintosh Performa 450, 460, 466, 467
- Macintosh Display Card 4•8, 8•24, and 8•24 GC

The following computers and video card do not require an adapter

- Macintosh Quadra Series
- Macintosh Centris Series
- Macintosh LC 475
- Macintosh Performa 475 and 476
- Macintosh 630 family
- Power Macintosh Family
- Macintosh Display Card 8•24AC

Multiple Scan 17 and 20 Displays

To get higher resolutions, your computer must support that resolution. The number of colors at the various resolutions depends on the amount of Video RAM (VRAM) you have in your Macintosh.

The following computers and video cards require a cable adapter to provide different resolutions

- Macintosh II series
- PowerBook 180, 180c, 160, 165, 165c
- PowerBook 500 Series
- PowerBook MiniDock and DuoDock (The DuoDock does not require an adapter when used with System 7.5)
- Macintosh LC, LC II, LC III
- Macintosh Performa 450, 460, 466, 467
- Macintosh Display Card 4•8, 8•24, and 8•24 GC

The following computers and video card do not require an adapter

- Macintosh Quadra Series
- Macintosh Centris Series
- Macintosh LC 475
- Macintosh Performa 475 and 476
- Macintosh 630 family
- Power Macintosh Family
- Macintosh Display Card 8•24AC

Display adapters are available from several third-party companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

3) Question:

I have a monitor which uses a Sony Trinitron picture tube. About one third of the way from the top and/or bottom of the monitor, I see a very thin gray line. Is there something wrong with my monitor?

Answer:

When you display a white or light background on some Apple color displays, you may notice a thin gray horizontal line or lines across the screen. These thin lines are supporting or stabilizing wires inside the CRT and are part of Sony's Trinitron CRT technology.

Sony Trinitron CRTs have a specially constructed aperture grill which improves the CRT's convergence and produces a sharp and clear image. The aperture grill is a grid of vertical wires located just behind the CRT screen. These CRTs require a horizontal stabilizing wire or wires to help support the aperture grill. The supporting wires, which are thinner than a human hair, stabilize the aperture grill against shocks.

The Macintosh 13-inch Hi-Res RGB Monitor and 14-inch Macintosh Color Display have a single support wire across the bottom third of the display. The Macintosh 16-inch Color Display and the Multiple Scan 17 and 20 Displays have two support wires visible across the top and bottom thirds of the screen.

Note that these are not screen defects. Their presence cannot be adjusted out or eliminated by repairing or replacing modules in the display.

4) Question:

There is a large black border around the edge of the viewable area of my monitor and the picture does not fill the entire screen. Is there something wrong with my monitor?

Answer:

It is normal for your monitor to have a black border around the displayed picture. The closer an image gets to the edges of a display, the lower its quality. The black border will vary in size, depending on the type of monitor you have. Some Apple displays allow you to fill most of the screen using a button on the front of the display.

5) Question:

I have a monitor experiencing one of the following symptoms:

- A jittering or shaking picture
- Discolored areas in the picture
- Horizontal lines cycling across the screen
- Distorted image

What is causing this?

Answer:

These symptoms can all be caused by electromagnetic interference. All monitors are subject to electromagnetic interference. Larger monitors are affected more by this than smaller ones.

If your monitor is exhibiting any of the above symptoms, try temporarily moving it to a different location to check for interference. If the symptom does not occur after moving the monitor, then there was likely a source of interference in the area where the monitor was originally located.

Possible sources of electromagnetic interference include:

- Other monitors
- Fluorescent lights
- Any thing with a motor (fans, air conditioners, and so on)
- Anything with a magnet (some mobile phones, speakers, and so on)

6) Question:

I purchased an Apple monitor and I cannot plug the power cable into the wall outlet. It has a shield around it that prevents this. How do I plug this monitor in?

Answer:

The power cable you are describing is designed to be connected to the power outlet on the back of your computer. Look on the back of the computer just above where the computer's power cord is connected. There will usually be a receptacle there with three prongs in it. Plug the shielded end of the monitor's power cable into this receptacle.

If your computer does not have such a receptacle (many older Macintosh models did not), you can obtain a regular power cord from most computer dealers and electronic stores. If you take the power cord you have to the location from which you purchased it, they may be able to swap it for the power cable you need.

7) Question:

I have changed some of the settings on my Apple Multiple Scan Display. How can I restore the monitor to the factory settings?

Answer:

You can restore the monitor to factory settings as follows:

- Multiple Scan 15 Display: open the front panel and press the Recall button.
- Multiple Scan 17 and 20 Displays: Open the front panel. On the extreme left, you will see a recessed button with a triangle icon over it and next to it, a button with a circle icon. Using a pen tip or something similar, hold in the button with the triangle and while holding it in, press the button with the circle.

This procedure may also help if the monitor is out-of-focus, has a tilted raster, is experiencing pin-cushioning, and so on.

8) Question:

I connected my Multiple Scan 15 Display to my computer and I cannot get sound to play through the speakers on the monitor. Why is this?

Answer:

To get computer sounds to play through the speakers of an attached Multiple Scan 15 Display, you must connect the sound out cable that came with the monitor from the sound output port on the back of your computer (the one with the speaker icon) to the sound port on the monitor.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Apple Remote Access: Frequently Asked Questions (11/95)

Revised: 2/12/96
Security: Everyone

Apple Remote Access: Frequently Asked Questions (11/95)

=====

Article Created: 19 July 1995
Article Reviewed/Updated: 10 November 1995

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Apple Remote Access (ARA).

Questions in this FAQ:
=====

- Why does ARA give me an error whenever I launch it?
- My modem is not on the list of ARA scripts, Where can I get the script for my modem?
- When I use ARA to dial the other computer, it connects for a few seconds, then hangs up.
- My modem will not connect at high speed. It is a 14.4 baud modem and I have selected the appropriate modem script, but I can only connect at 9600 baud. What can I do?
- I'm connected via ARA, but where is the stuff on my other computer?
- I can see the host network but the host network machines cannot see me. Why is this?
- Why can my 1.0 ARA not connect to my 2.0 server?
- Why does my ARA refuses to start up?
- I am using AppleShare and ARA and I cannot access my users and groups control panel.

DISCUSSION -----

Question:

Why does ARA give me an error whenever I launch it?

Answer:

You need to turn on AppleTalk. ARA cannot function without AppleTalk being turned on in the Chooser. It will give a number of artificial errors if AppleTalk is inactive, such as:

- "Every time I try to use ARA, my computer tells me to reinstall. I've tried reinstalling several times, to no avail."
- "I keep getting some sort of weird error on startup or launch of ARA" Common ones are no description, inits turned off, Error number -5555 or larger.
- "AppleTalk Remote Access Setup Error: No Description"

Question:

My modem is not on the list of ARA scripts, where can I get the script for my modem?

Answer:

If your Modem is not listed in the default set of ARA modem Scripts, please contact your modem manufacturer's technical support staff for information on their specific ARA script. Some modem companies provide a Bulletin Board Service (BBS) and others will mail you a modem script.

Question:

When I use ARA to dial the another computer, it connects for a few seconds, then hangs up.

Answer:

This is most likely a script problem. You need to call the manufacturer of your modem, and get the latest script. Refer to the answer above.

Question:

My modem will not connect at high speed. It is a 14.4 kbps modem and I have selected the appropriate modem script, but I can only connect at 9600 bps. What can I do?

Answer:

Make sure you are using a hardware handshake cable. You can check with the modem manufacturer to verify this.

Question:

I'm connected via ARA, but where is the stuff on my other computer?

Answer:

Connecting via ARA is just like being connected to the network. You still need to go to the Chooser, click on AppleShare, select a server, and so on. Do the

things you would normally do if you were connected to the network. Note: Other computers cannot see you. Refer to the question below.

Question:

I can see the host network but the host network machines cannot see me. Why is this?

Answer:

ARA only acts as a half router, it only goes one way. The caller can see the remote network but the remote network cannot see the callers network. If you want to set up a full router that will join the two networks you need to use the wide area features of the Apple Internet Router 3.0.

Question:

Why can my 1.0 ARA not connect to my 2.0 server.

Answer:

You need to download the ARA 1.0 Client Enabler which will let a 1.0 client call into a 2.0 server. Otherwise, ARA 1.0 is incompatible with 2.0 servers. However, you can put the 2.0 client into compatibility mode and dial into a 1.0 server.

Question:

Why does my ARA software refuses to launch?

Answer:

You need to be using at least AppleTalk version 57.04. Old installers will sometimes install an old version. Just reinstalling using the ARA installer after running an older installer will fix the problem.

Question:

I am using AppleShare and ARA and I cannot access my Users and Groups control panel.

Answer:

ARA uses the same Users and Groups file that is used by file sharing unless you have installed the AppleShare file server. In order to change the users and groups information under AppleShare you must run AppleShare Admin. The users dialog will have an "allow this user to log in" option below the standard preferences information if ARA has been installed. ARA is incompatible with AppleShare 2.0 and with AppleShare Pro.

Apple IDE Hard Disk and Creating Partitions (4/96)

Revised: 4/19/96
Security: Everyone

Apple IDE Hard Disk and Creating Partitions (4/96)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 19 April 1996

TOPIC -----

Is it possible to make partitions on an Apple IDE hard disk? What kind of software can I use?

DISCUSSION -----

Yes, it is possible to partition an IDE hard drive on a Macintosh. You may use Apple's Drive Setup software to accomplish this task. With Drive setup you may partition Apple hard drives as follows:

- 1 HFS Volume
- 2 HFS Volumes
- 3 HFS Volumes
- 4 HFS Volumes
- 5 HFS Volumes
- 6 HFS Volumes
- 7 HFS Volumes
- 8 HFS Volumes

- 1 ProDOS, 1 HFS Volume
- 2 ProDOS, 1 HFS Volume

Drive Setup 1.0.4 is included with System 7.5 Update 2.0, which is available on online services. Drive Setup supports the following computers:

Power Macintosh computers

Drive Setup is supported on all of the current Power Macintosh computers. This includes all the original Power Macintosh computers as well as the PCI-based Power Macintosh computers.

IMPORTANT: Drive Setup is not supported with the Macintosh Processor Upgrade. If the upgrade is installed in a 64040- or 68LC040-based desktop computer with an IDE drive, use the 601 Processor Upgrade control panel to turn the card off before using Drive Setup.

The original Power Macintosh upgrade card is not supported either.

Desktop computers with IDE drives

Drive Setup is supported on 68040- or 68LC040-based desktop computers that have IDE drives installed, which includes:

- Macintosh LC 580
- Macintosh 630 series (LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640)

IMPORTANT: Drive Setup is not supported on any 68LC040 processor equipped computers without IDE drives, even if the computer has a Power Macintosh Upgrade Card installed. If Drive Setup is launched on a computer that is not supported, a dialog box appears with the message, "Drive Setup cannot be launched on this computer," and an OK button.

PowerBook computers with IDE Drives

Drive Setup is supported on most PowerBook computers with an IDE drive, which includes:

- PowerBook 190
- PowerBook Duo 2300
- PowerBook 5300

IMPORTANT: The only exception is the PowerBook 150, which must use the Internal HD Format utility.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article was published in the "Information Alley":
Volume II, Issue 12, Page 5

Article Change History:

19 Apr 1996 - Added PowerBook information.
05 Oct 1995 - Added Info Alley information; updated article.
04 Oct 1995 - Further clarification on supported computer systems.

Apple LaserWriter Printers: Frequently Asked Questions (7/96)

Revised: 12/20/96
Security: Everyone

Apple LaserWriter Printers: Frequently Asked Questions (7/96)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Apple LaserWriter printers.

Questions in this FAQ:
=====

- 1) How do I share a printer on a network using Grayshare?
- 2) Some of my page size options don't show up (such as the 500-sheet tray) and/or, I get frequent PostScript errors when printing. What is causing this?
- 3) I have a PowerBook 500 series computer and a QuickDraw LaserWriter Printer. When I try to print, I get messages telling me to check my connections. My connections appear to be OK, what is causing this?
- 4) When I try to install the software for my Personal LaserWriter 300, I get a message saying that System 7 or greater is needed, but I already have system 7 installed.
- 5) When I select the LaserWriter icon in my Chooser, no printer name appears on the right. Why is this?
- 6) When I print from the manual feed tray with background printing on, I get a message telling me to select the PrintMonitor from the Applications Menu and then have to click OK. Is there any way to avoid these steps?

DISCUSSION -----

- 1) How do I share a printer on a network using Grayshare?

Answer:

QuickDraw LaserWriters cannot be directly connected to a network with LocalTalk cables. Some, however, can be shared on a network with Apple's Grayshare technology.

The following QuickDraw LaserWriters can use this technology:

LaserWriter Select 300

Personal LaserWriter 300

Personal LaserWriter LS (when using the LaserWriter 300 driver)

NOTE: The computer to which the printer is directly attached should have at least a 68020 processor.

Sharing a Printer

To share one the above LaserWriters with others, follow these steps:

Step 1

In order to share a printer, you must be connected to an AppleTalk network.

• LocalTalk Connection

The LocalTalk connector goes into the printer port. The peripheral-8 cable (serial cable) connects the printer to the Macintosh. It goes into the modem port.

• Ethernet or Token Ring Connection

Since both Ethernet and Token Ring connections don't require you to use a serial port on your Macintosh, you can use either the printer or modem port to connect the printer to your Macintosh.

Step 2

Open the Chooser and select the appropriate printer icon.

Step 3

Click the icon of the port your printer is connected to. If you are using the printer port to connect your Macintosh to the network, you must connect your LaserWriter to the modem port.

Step 4

Click the Setup button to open the Sharing Setup dialog box.

Step 5

Select the "Share this Printer" checkbox. This places an "X" in the checkbox. You have the option of naming your printer and entering a password. If you use a

password for the printer, only users who know the password can use the printer from their computers.

If you want a record of what is printed on your printer, select the "Keep Log of Printer Usage" checkbox.

Step 6

Click "OK" to close the Sharing Setup dialog box, then close the Chooser window.

Your printer is now available to others on the network.

Printing to a Shared Printer

To print to a shared printer, follow these steps:

Step 1

Open the Chooser and select the appropriate printer icon. A list of available printers displays.

Step 2

Click the name of the shared printer that you want to use. If the printer requires a password, a dialog appears, and you must enter the password.

Step 3

Close the Chooser

You are now ready to print to the shared printer.

2) Some of my page size options do not show up (such as the 500-sheet tray) and/or, I get frequent PostScript errors when printing. What is causing this?

Answer:

Symptoms like this can occur when you are using a PostScript printer with LaserWriter 8 Driver, and you have not setup the printer properly in the Chooser. Follow the instructions below to properly setup your printer.

Step 1

Open the Chooser

Step 2

Select the LaserWriter 8 icon

Step 3

Select the name of the printer from the list that appears on the right

Step 4

Select the Setup button

Step 5

Select Auto Setup

Step 6

The driver selects a PostScript Printer Description (PPD) for the printer. a message appears on the screen that reads "PostScript Printer Description File Selected:" followed by the name of your printer. If the name of your printer does not appear, use the Select PPD button to manually select the proper PPD. If the PPD is not listed, reinstall your printer software and try the process again.

Step 7

If you have added any paper trays or RAM to the printer, you may need to configure them before they will be accessible. Select the Configure button. If this button does not appear, select the More Choices button. You will see options for the various paper trays. If you have added a particular tray, make sure to change the option near the tray's name to read "Installed". If you have added additional RAM, make sure you change the option next to the RAM button to the closest value.

Step 8

Select OK to leave the Chooser

Your printer is now setup properly.

3) I have a PowerBook 500 series computer and a QuickDraw LaserWriter Printer. When I try to print, I get messages telling me to check my connections. My connections appear to be OK, what is causing this?

Answer:

The PowerBook 520c and 540c computers use a single serial port which is a combination Printer/Modem port. In order to use this port for serial printing, use the following information to properly configure your PowerBook 500 series computer:

Step 1

If the Express Modem is installed:

- A) Open the Express Modem control panel and select Use External Modem.
- B) Open the PowerBook Setup control panel and select Normal.

Step 2

Open the Chooser and do the following:

A) If you are using the PowerBook 200 series, turn OFF AppleTalk. If you are using the PowerBook 500 series, you do not have to disable AppleTalk. If you are using Ethernet; you MUST verify that the Network Control Panel is set for Ethernet.

- Select the serial printer driver.
- Select the "printer/modem" icon (or the modem icon if the printer/modem icon is not available).

Step 3

If the Assistant Toolbox extension is enabled, disable it using the Extensions Manager control panel.

NOTE:

U.S. PowerBook 500 series computers will have a Global Village PowerPort Mercury modem installed, not an Express modem, and therefore will only need to have the PowerBook Setup control panel set to normal for step #1.

A similar situation can also occur when using other serial printers. If you see no port selection choices, make sure the PowerBook Setup control panel is set for Normal.

4) Question: When I try to install the software for my Personal LaserWriter 300, I get a message saying that System 7 or greater is needed, but I already have System 7 installed.

Answer:

This message usually occurs when you are trying to install the printer software on a computer on which the driver is already installed.

Check the Chooser to verify the driver is not already there. If it is not, install the printer software.

Step 1

Insert the printer installation disk and double-click the Installer

Step 2

When the Welcome to the Installer screen appears, click OK

Step 3

When the Install screen appears, select Customize or Custom Install

Step 4

Choose the individual portions of software you want to install. If you have System 7.5, elect to install software for system 7.1.

Step 5

Click Install

5) Question: When I select the LaserWriter icon in my Chooser, no printer name appears on the right. Why is this?

Answer: There could be many things causing this. Try the following (these steps apply only to PostScript LaserWriters which use the LaserWriter or LaserWriter 8 driver):

- Check the cable connection. Disconnect the cables and re-connect them. Be sure you are using the correct type of cables. Many older LaserWriters use LocalTalk cables and have not been tested with serial cables. Check the printer manual to see if this is the case.

- If you are using AppleTalk, make sure the printer is connected to the printer port and not the modem port.

- Make sure AppleTalk is set to Active in the Chooser. If it is inactive, make it active and restart.

- Make sure your Network control panel is set correctly. If you are using AppleTalk, set it to "LocalTalk Built In". If you are using EtherTalk, make sure it is set to EtherTalk.

- Verify the switch setting on the printer. Most printers have some method of setting the port settings on the printer. Depending on the type of printer, it may be a SCSI-ID type switch, a set of DIP switches, or a dial. Set the switch as follows:

- For an original LaserWriter or LaserWriter Plus, set it to AppleTalk
- If the printer has a SCSI-ID type switch, set it to 0 (zero)
- For a LaserWriter IInt or IIntx set all DIP switches up
- For a LaserWriter 16/600 PS, set the switch down

The above steps will resolve most problems. If the cable is damaged the above steps will not let you see the printer, and you must replace the damaged cable.

6) Question: When I print from the manual feed tray with background printing on, I get a message telling me to select the PrintMonitor from the Applications Menu and then have to click OK. Is there any way to avoid these steps?

Answer:

To disable the notification message, do this:

Step 1

Open the System Folder and then open the Extensions folder

Step 2

Double-click the PrintMonitor application

Step 3

Select Preferences from the File menu

Step 4

Where it says "When manual feed job starts:" select "Give no notification"

This disables the message.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Apple LaserWriter Printers: Frequently Asked Questions (7/96)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Apple LaserWriter printers.

Questions in this FAQ:
=====

- 1) How do I share a printer on a network using Grayshare?
- 2) Some of my page size options don't show up (such as the 500-sheet tray) and/or, I get frequent PostScript errors when printing. What is causing this?
- 3) I have a PowerBook 500 series computer and a QuickDraw LaserWriter Printer. When I try to print, I get messages telling me to check my connections. My connections appear to be OK, what is causing this?
- 4) When I try to install the software for my Personal LaserWriter 300, I get a message saying that System 7 or greater is needed, but I already have system 7 installed.
- 5) When I select the LaserWriter icon in my Chooser, no printer name appears on the right. Why is this?
- 6) When I print from the manual feed tray with background printing on, I get a message telling me to select the PrintMonitor from the Applications Menu and then have to click OK. Is there any way to avoid these steps?

DISCUSSION -----

- 1) How do I share a printer on a network using Grayshare?

Answer:

QuickDraw LaserWriters cannot be directly connected to a network with LocalTalk cables. Some, however, can be shared on a network with Apple's Grayshare technology.

The following QuickDraw LaserWriters can use this technology:

LaserWriter Select 300

Personal LaserWriter 300

Personal LaserWriter LS (when using the LaserWriter 300 driver)

NOTE: The computer to which the printer is directly attached should have at least a 68020 processor.

Sharing a Printer

To share one the above LaserWriters with others, follow these steps:

Step 1

In order to share a printer, you must be connected to an AppleTalk network.

• LocalTalk Connection

The LocalTalk connector goes into the printer port. The peripheral-8 cable (serial cable) connects the printer to the Macintosh. It goes into the modem port.

• Ethernet or Token Ring Connection

Since both Ethernet and Token Ring connections don't require you to use a serial port on your Macintosh, you can use either the printer or modem port to connect the printer to your Macintosh.

Step 2

Open the Chooser and select the appropriate printer icon.

Step 3

Click the icon of the port your printer is connected to. If you are using the printer port to connect your Macintosh to the network, you must connect your LaserWriter to the modem port.

Step 4

Click the Setup button to open the Sharing Setup dialog box.

Step 5

Select the "Share this Printer" checkbox. This places an "X" in the checkbox. You have the option of naming your printer and entering a password. If you use a

password for the printer, only users who know the password can use the printer from their computers.

If you want a record of what is printed on your printer, select the "Keep Log of Printer Usage" checkbox.

Step 6

Click "OK" to close the Sharing Setup dialog box, then close the Chooser window.

Your printer is now available to others on the network.

Printing to a Shared Printer

To print to a shared printer, follow these steps:

Step 1

Open the Chooser and select the appropriate printer icon. A list of available printers displays.

Step 2

Click the name of the shared printer that you want to use. If the printer requires a password, a dialog appears, and you must enter the password.

Step 3

Close the Chooser

You are now ready to print to the shared printer.

2) Some of my page size options do not show up (such as the 500-sheet tray) and/or, I get frequent PostScript errors when printing. What is causing this?

Answer:

Symptoms like this can occur when you are using a PostScript printer with LaserWriter 8 Driver, and you have not setup the printer properly in the Chooser. Follow the instructions below to properly setup your printer.

Step 1

Open the Chooser

Step 2

Select the LaserWriter 8 icon

Step 3

Select the name of the printer from the list that appears on the right

Step 4

Select the Setup button

Step 5

Select Auto Setup

Step 6

The driver selects a PostScript Printer Description (PPD) for the printer. a message appears on the screen that reads "PostScript Printer Description File Selected:" followed by the name of your printer. If the name of your printer does not appear, use the Select PPD button to manually select the proper PPD. If the PPD is not listed, reinstall your printer software and try the process again.

Step 7

If you have added any paper trays or RAM to the printer, you may need to configure them before they will be accessible. Select the Configure button. If this button does not appear, select the More Choices button. You will see options for the various paper trays. If you have added a particular tray, make sure to change the option near the tray's name to read "Installed". If you have added additional RAM, make sure you change the option next to the RAM button to the closest value.

Step 8

Select OK to leave the Chooser

Your printer is now setup properly.

3) I have a PowerBook 500 series computer and a QuickDraw LaserWriter Printer. When I try to print, I get messages telling me to check my connections. My connections appear to be OK, what is causing this?

Answer:

The PowerBook 520c and 540c computers use a single serial port which is a combination Printer/Modem port. In order to use this port for serial printing, use the following information to properly configure your PowerBook 500 series computer:

Step 1

If the Express Modem is installed:

- A) Open the Express Modem control panel and select Use External Modem.
- B) Open the PowerBook Setup control panel and select Normal.

Step 2

Open the Chooser and do the following:

A) If you are using the PowerBook 200 series, turn OFF AppleTalk. If you are using the PowerBook 500 series, you do not have to disable AppleTalk. If you are using Ethernet; you MUST verify that the Network Control Panel is set for Ethernet.

- Select the serial printer driver.
- Select the "printer/modem" icon (or the modem icon if the printer/modem icon is not available).

Step 3

If the Assistant Toolbox extension is enabled, disable it using the Extensions Manager control panel.

NOTE:

U.S. PowerBook 500 series computers will have a Global Village PowerPort Mercury modem installed, not an Express modem, and therefore will only need to have the PowerBook Setup control panel set to normal for step #1.

A similar situation can also occur when using other serial printers. If you see no port selection choices, make sure the PowerBook Setup control panel is set for Normal.

4) Question: When I try to install the software for my Personal LaserWriter 300, I get a message saying that System 7 or greater is needed, but I already have System 7 installed.

Answer:

This message usually occurs when you are trying to install the printer software on a computer on which the driver is already installed.

Check the Chooser to verify the driver is not already there. If it is not, install the printer software.

Step 1

Insert the printer installation disk and double-click the Installer

Step 2

When the Welcome to the Installer screen appears, click OK

Step 3

When the Install screen appears, select Customize or Custom Install

Step 4

Choose the individual portions of software you want to install. If you have System 7.5, elect to install software for system 7.1.

Step 5

Click Install

5) Question: When I select the LaserWriter icon in my Chooser, no printer name appears on the right. Why is this?

Answer: There could be many things causing this. Try the following (these steps apply only to PostScript LaserWriters which use the LaserWriter or LaserWriter 8 driver):

- Check the cable connection. Disconnect the cables and re-connect them. Be sure you are using the correct type of cables. Many older LaserWriters use LocalTalk cables and have not been tested with serial cables. Check the printer manual to see if this is the case.

- If you are using AppleTalk, make sure the printer is connected to the printer port and not the modem port.

- Make sure AppleTalk is set to Active in the Chooser. If it is inactive, make it active and restart.

- Make sure your Network control panel is set correctly. If you are using AppleTalk, set it to "LocalTalk Built In". If you are using EtherTalk, make sure it is set to EtherTalk.

- Verify the switch setting on the printer. Most printers have some method of setting the port settings on the printer. Depending on the type of printer, it may be a SCSI-ID type switch, a set of DIP switches, or a dial. Set the switch as follows:

- For an original LaserWriter or LaserWriter Plus, set it to AppleTalk
- If the printer has a SCSI-ID type switch, set it to 0 (zero)
- For a LaserWriter IInt or IIntx set all DIP switches up
- For a LaserWriter 16/600 PS, set the switch down

The above steps will resolve most problems. If the cable is damaged the above steps will not let you see the printer, and you must replace the damaged cable.

6) Question: When I print from the manual feed tray with background printing on, I get a message telling me to select the PrintMonitor from the Applications Menu and then have to click OK. Is there any way to avoid these steps?

Answer:

To disable the notification message, do this:

Step 1

Open the System Folder and then open the Extensions folder

Step 2

Double-click the PrintMonitor application

Step 3

Select Preferences from the File menu

Step 4

Where it says "When manual feed job starts:" select "Give no notification"

This disables the message.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

PowerBook Software: Frequently Asked Questions (8/96)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 15 August 1996

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about PowerBook software.

Questions Answered in This FAQ:
=====

- 1) What is the Control Strip and how can I get it?
- 2) I am using System 7.1, can I use the Control Strip?
- 3) I want to use the Control Strip software on my desktop Macintosh. Is this possible?
- 4) The Control Strip is stuck in the middle of the screen. How can I move it?
- 5) Whenever I hit a key on my keyboard I hear a beep sound and the character does not register on the screen. What's going on?
- 6) What is a system enabler, why do I need it, and which version should I use?
- 7) I just installed a screen saver but I've noticed that after the screen saver kicks in, it slows down significantly. What is causing this?
- 8) What is processor cycling and how do I turn it off?
- 9) What does the Assistant Toolbox extension do?
- 10) What does PowerBook File Assistant do?
- 11) I am trying to use PowerBook File Assistant to synchronize two files but I get the error message that they do not have the same creation date. How can

I get around this?

12) Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

13) Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

14) I have connected a 14" display to my PowerBook, but I am only getting a 640 x 400 image on the external monitor. What should I do?

15) How do I back up the files on my PowerBook 145B or 150?

16) I made a backup of the information on my PowerBook 145B/150 hard drive. Now I would like to restore just one of my control panels. Can I restore a single file from the backup?

17) I did not make a backup of the system software on my PowerBook 145B (or PowerBook 150), and now I think I need to reload the operating system. I do not want to upgrade to System 7.5. Where can I get a new copy of the software that came with my PowerBook?

18) I am upgrading my PowerBook with Express Modem to System 7.5. What version of the Express Modem software should I be using?

19) Do I need the Duo Battery Patch?

20) What ColorSync System Profile should I use on my PowerBook?

21) What is an extension conflict and how do I know if I have one?

22) How do I troubleshoot an extension conflict?

23) What is zapping the PRAM and when should I do it?

24) Where else can I go for answers?

DISCUSSION -----

1) Question: What is the Control Strip and how can I get it?

Answer: The Control Strip is a PowerBook-specific feature (until recently, see below) that allows easy access to AppleTalk, file sharing, hard disk spin down, the PowerBook control panel, PowerBook sleep, and sound volume. The Control Strip also gives an indication of the battery level, estimated battery time remaining, and battery usage level. The Control Strip is a thin, horizontal bar that can be easily dragged to any part of the screen, resized, reordered, or closed. In addition to the Apple Control Strip modules, there are many other Control Strip modules available as shareware at online services. To add a Control Strip module, drag the module into the Control Strip Modules folder in the System Folder and restart the computer. The Control Strip comes with system software versions 7.1.1 and later.

2) Question: I am using System 7.1, can I use the Control Strip?

Answer: The Control Strip only works with system software version 7.1.1 and later. If you try to drag the Control Strip modules and control panel into a System 7.1 (or earlier) System Folder, the Control Strip will not show up.

3) Question: I want to use the Control Strip software on my desktop Macintosh. Is this possible?

Answer: Until recently, Apple has only supported the use of the Control Strip software on PowerBooks. There are third-party patches to allow use of the Control Strip on a desktop Macintosh, but this solution is not supported by Apple. The only desktop configuration currently supported with the Control Strip is a desktop Macintosh using the AppleVision 1710 Display, which comes with software that allows the Control Strip to be used on any Macintosh.

4) Question: The Control Strip is stuck in the middle of the screen. How can I move it?

Answer: You can drag the Control Strip vertically and horizontally at any time by holding down the Option key while dragging it. You can also rearrange the order of the Control Strip modules by holding down the Option key while dragging the modules in the Control Strip.

5) Question: Whenever I hit a key on my keyboard I hear a beep sound and the character does not register on the screen. What's going on?

Answer: You have invoked the Slow Keys feature of the Easy Access control panel. Slow Keys is designed to make typing easier for disabled persons and requires that you hold down a key for several seconds before it is recognized. Slow Keys is activated by holding down the Return key for more than 5 seconds. You can turn Slow Keys off in the Easy Access control panel or remove Easy Access from the control panel folder altogether and restart the computer.

6) Question: What is a system enabler, why do I need it, and which version should I use?

Answer: A system enabler provides system software code for your specific PowerBook to work with system software. An enabler is not required if you are using a version of the system software that was released after your particular model of PowerBook was released. For instance, if you are using a PowerBook 160 and System 7.5, you do not need a system enabler. If the enabler is needed and is missing, the computer will start up with an error message about the version of the system software being incorrect. The correct enabler can usually be found in the System Folder on the Disk Tools disk that came with the PowerBook.

7) Question: I just installed a screen saver but I've noticed that after the

screen saver kicks in, it slows down significantly. What is causing this?

Answer: It is most likely the case that processor cycling is activating and causing the screen saver to slow down. For instructions on turning processor cycling off, see the question below.

8) Question: What is processor cycling and how do I turn it off?

Answer: All PowerBook models implement a feature called processor cycling (formerly known as processor rest) intended to save battery life. This feature activates when the computer detects that the keyboard, mouse, trackball, or Trackpad has not been used for more than a few seconds. At this time, the processor speed is reduced to about 3 MHz and all processing functions become extremely slow. Processor cycling will not activate while the computer is doing any sort of data transfer.

Note that by default processor cycling is on, and although it is intended to for battery life conservation, it will also activate while running off AC power.

The method of turning off processor cycling will depend on the version of the system software you are using:

System 7.0.1

=====

Step 1

Open the Portable control panel.

Step 2

While holding down the Option key, click on the word "Minutes".

Step 3

Select Don't Rest and click OK.

System 7.1

=====

Step 1

Open the PowerBook control panel.

Step 2

While holding down the Option key on the keyboard, click the Options... button in the control panel.

Step 3

Select "Don't allow cycling".

System 7.5 or later
=====

Step 1

Open the PowerBook control panel.

Step 2

Make sure the toggle switch in the control panel is set to Easy.

Step 3

While holding down the Option key on the keyboard, drag the toggle switch from Easy to Custom and let go.

Step 4

Uncheck the "Allow processor cycling - more battery savings" checkbox.

9) Question: What does the Assistant Toolbox extension do?

Answer: The Assistant Toolbox extension adds several features and functionalities to a PowerBook:

* Battery Management

The Assistant Toolbox adds to the base system's ability to manage battery life.

* Persistent RAM disk

Gives the PowerBook the ability to save RAM disk data to the hard disk when shutting down and read it back in when starting up. Normally, a RAM disk is lost when the PowerBook is completely shut down.

* Sleep Fkey

Using the key sequence Command (Apple)-Shift-0 (the number), you can quickly put the PowerBook to sleep.

* Later Laser

Later Laser allows deferred printing of documents when the PowerBook is disconnected from a printer or network. When you reconnect, the documents print when the printer is available. Later Laser is only active when a laser printer is chosen.

* SCSI Sleep

SCSI Sleep mounts any previously connected hard drives as a PowerBook comes out of sleep.

* Anti-Submarining Cursor

The Anti-Submarining Cursor feature is a software fix for the "submarining" cursor effect on the gray-scale passive-matrix screens. "Submarining" is when

the cursor disappears as it is moved quickly. This is an important feature for all passive-matrix gray-scale PowerBooks.

* Always AppleTalk

The Always AppleTalk feature lets you activate AppleTalk without restarting the computer.

All of these features are built in to the Assistant Toolbox extension and are loaded automatically when the extension is loaded.

10) Question: What does PowerBook File Assistant do?

Answer: PowerBook File Assistant, now simply named File Assistant, is a program that can automatically synchronize a file, a folder, or an entire volume between two computers. This program can be very useful for PowerBook owners that often find themselves in the situation where they are maintaining a database on a central computer and then updating the information on the road with the PowerBook. When the user comes back with the updated information, they simply connect the two computers and run the File Assistant program and all files on both computers are up to date and synchronized. The File Assistant program is bundled on the hard drive of all currently available PowerBook computers.

11) Question: I am trying to use PowerBook File Assistant to synchronize two files but I get the error message that they do not have the same creation date. How can I get around this?

Answer: PowerBook File Assistant will not synchronize two files that have the same name but different creation dates. If File Assistant generates this message in error, remove the Assistant Data file from the Preferences folder within the System Folder, and set up the synchronization again.

12) Question: Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook models that have only one serial port (200's, 2300's, 190's, 5300's), the serial port is mapped as a modem port. Under normal conditions this isn't a problem - the internal modem can be used at the same time as a serial device such as a printer is being used. The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to Internal, Compatible, or "Use internal modem instead of modem port". The location of this setting will depend on what version of the modem and system software you have. When the PowerBook is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there's an update.

13) Question: Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

Answer: As discussed in the previous question, a PowerBook with a single serial port (200's, 2300's, 190's, 5300's) introduces some variables to serial printing. Three things must be true to print to a serial printer with a single serial port PowerBook:

Step 1

AppleTalk must be set to inactive in the Chooser or something other than LocalTalk must be selected in the Network control panel.

Step 2

If you have an internal modem you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to External, Normal, or uncheck "Use internal modem instead of modem port" (see above). The location of this setting will depend on what version of the modem and system software you have.

Step 3

When selecting the serial printer in the Chooser, you must select the modem port or the combined printer/modem port. Do not select the printer port.

14) Question: I have connected a 14" display to my PowerBook, but I am only getting a 640 x 400 image on the external monitor. What should I do?

Answer: It sounds like you have video mirroring enabled. Open the PowerBook Display control panel and see if mirroring is on. If so, it generates the same image on both displays. Since many PowerBooks have a screen resolution of 640 x 400, the external monitor mirrors that resolution.

Turn off mirroring, then check your settings in the Monitors control panel. To make your external monitor the main monitor, drag the menu bar in the Monitors control panel from monitor 1 to monitor 2.

15) Question: How do I back up the files on my PowerBook 145B or 150?

Answer: Instructions for backing up the information on the PowerBook 145B or PowerBook 150 are available in the online Apple Technical Information Library. Use the search string "PowerBook 145B and backup" instructions to locate the article "PowerBook 145 & 150: Backup and Restore Instructions." The instructions are also detailed in the User's Guide that comes with both computers.

16) Question: I made a backup of the information on my PowerBook 145B/150 hard drive. Now I would like to restore just one of my control panels. Can I restore a single file from the backup?

Answer: No. The PowerBook 145B and 150 backup does not allow for restoring single files.

17) Question: I did not make a backup of the system software on my PowerBook 145B (or PowerBook 150), and now I think I need to reload the operating system. I do not want to upgrade to System 7.5. Where can I get a new copy of the software that came with my PowerBook?

Answer: You can order a pre-made backup of the operating system for a PowerBook 145B and 150 by contacting Apple at 800-767-2775. A shipping and handling fee will apply.

18) Question: I am upgrading my PowerBook with Express Modem to System 7.5. What version of the Express Modem software should I be using?

Answer: You should upgrade your Express Modem software to at least version 1.5.3. Earlier versions may not work properly with System 7.5.

19) Question: Do I need the Duo Battery Patch?

Answer: The Duo Battery Patch should be installed on any PowerBook Duo 210, 230, or 250 that is using PowerBook Duo Enabler 1.0, and has an Express Modem installed. This is the only configuration of PowerBook Duo which receives any benefit from the presence of the Duo Battery Patch. System software versions 7.1.1 and later do not require the patch.

20) Question: What ColorSync System Profile should I use on my PowerBook?

Answer: If you have a PowerBook 180c, 540c, 5300c, 5300ce use PowerBook 180c Standard.

If you have a PowerBook 165c, 520c, 190cs, 5300cs use PowerBook 165c Standard.

If you have a PowerBook 270c, 280c, 2300c use PowerBook 270c Standard.

Non-color PowerBooks do not use ColorSync.

21) Question: What is an extension conflict and how do I know if I have one?

Answer: The resources that are added to your system software by programs and utilities are typically called extensions or INITs and are kept in the Extensions folder or the Control Panels folder in the System Folder. If these extensions are not completely compatible, they can cause the computer to do strange things.

With PowerBooks, symptoms that are typical of being caused by an extension conflict are: freezing, Type XX errors (where XX is a number), "floating point coprocessor not installed" errors, not coming out of sleep properly, not

auto-dimming the display, not auto-sleeping, not spinning down the hard drive, not reading floppy disks correctly, displaying anomalous information or "garbage" on the screen, getting errors when printing, not accessing external devices, modem not connecting properly or dropping the line, not connecting to a network properly, and many others.

22) Question: How do I troubleshoot an extension conflict?

Answer: If a problem is consistent and "testable," it is very easy to determine if the problem is being caused by an extension conflict.

If you are using System 7.1 or earlier, try starting up the computer with the Shift key held down to turn the extensions off. You should see the message "Welcome to Macintosh, Extensions Off." If the symptoms go away when the extensions are off, then you have an extension conflict.

Identifying the Conflicting Extension:

Step 1

Create a new folder on the desktop called "Removed Extensions."

Step 2

Move all items of Kind "system extension," "control panel," or "Chooser extension" from the System Folder, Extensions folder, and Control Panels folder to this new folder. When you open these folders, choose "by Kind" from the View menu to help identify the files you need to move.

Step 3

Close the System Folder, and restart the Macintosh. Test for the problem.

Note: If the problem still occurs, check your System Folder to make sure you've removed all the extensions and control panels.

Step 4

Move a few items from the new folder on the desktop to the closed System Folder and restart the Macintosh. Make sure you note which items you moved.

Step 5

Attempt to recreate the original problem.

Repeat steps 4 and 5 for each item in the Removed Extensions folder until the problem recurs. The last item returned to the System Folder is likely to be the cause of the problem.

If you are using System 7.5 or later, you have the luxury of having a built-in Extensions Manager in the Control Panels folder. Select the System 7.5 Only set of extensions from the Extensions Manager control panel, then restart. If the

symptoms go away, then you have an extension conflict. You can then use the Extensions Manager to turn a few extensions and control panels off at a time, then restart the computer. When the problem comes back, one of the items you last selected is most likely causing the problem. You can also activate the Extensions Manager by holding down the Space Bar while the computer is starting up.

23) Question: What is zapping the PRAM and when should I do it?

Answer: "Zapping" or resetting the PRAM (parameter RAM) resets most of the information in the PRAM chip to its default value. This chip is powered by the backup battery and is used to hold settings that you want to be set even after the computer has been turned off, such as the time (although the time is not reset when zapping the PRAM). Many control panel settings such as sound, mouse speed, and memory are kept in the PRAM as well as many network, SCSI, and screen settings.

To reset the PRAM, restart the computer and hold down the Command (Apple), Option, P, and R keys. Wait for the computer to make its startup chime twice. You may then release the keys. Be aware that resetting the PRAM will reset such settings as the sound volume and mouse speed to their default value, and will purge the contents of a RAM disk if you are using one.

You should only reset the PRAM if you are having a problem that you think could be caused by corrupted information in the PRAM chip. A good tip that the PRAM might be corrupted is if a certain control panel won't hold it's setting or isn't operating correctly, the computer is having trouble printing, or there is a problem with networking.

24) Question: Where else can I go for answers?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Technical Information Library (TIL). This library contains thousands of technical articles which are easily searchable using boolean search strings.

21) What is an extension conflict and how do I know if I have one?

22) How do I troubleshoot an extension conflict?

23) What is zapping the PRAM and when should I do it?

24) Where else can I go for answers?

DISCUSSION -----

1) Question: What is the Control Strip and how can I get it?

Answer: The Control Strip is a PowerBook-specific feature (until recently, see below) that allows easy access to AppleTalk, file sharing, hard disk spin down, the PowerBook control panel, PowerBook sleep, and sound volume. The Control Strip also gives an indication of the battery level, estimated battery time remaining, and battery usage level. The Control Strip is a thin, horizontal bar that can be easily dragged to any part of the screen, resized, reordered, or closed. In addition to the Apple Control Strip modules, there are many other Control Strip modules available as shareware at online services. To add a Control Strip module, drag the module into the Control Strip Modules folder in the System Folder and restart the computer. The Control Strip comes with system software versions 7.1.1 and later.

2) Question: I am using System 7.1, can I use the Control Strip?

Answer: The Control Strip only works with system software version 7.1.1 and later. If you try to drag the Control Strip modules and control panel into a System 7.1 (or earlier) System Folder, the Control Strip will not show up.

3) Question: I want to use the Control Strip software on my desktop Macintosh. Is this possible?

Answer: Until recently, Apple has only supported the use of the Control Strip software on PowerBooks. There are third-party patches to allow use of the Control Strip on a desktop Macintosh, but this solution is not supported by Apple. The only desktop configuration currently supported with the Control Strip is a desktop Macintosh using the AppleVision 1710 Display, which comes with software that allows the Control Strip to be used on any Macintosh.

4) Question: The Control Strip is stuck in the middle of the screen. How can I move it?

Answer: You can drag the Control Strip vertically and horizontally at any time by holding down the Option key while dragging it. You can also rearrange the order of the Control Strip modules by holding down the Option key while dragging the modules in the Control Strip.

5) Question: Whenever I hit a key on my keyboard I hear a beep sound and the character does not register on the screen. What's going on?

Answer: You have invoked the Slow Keys feature of the Easy Access control panel. Slow Keys is designed to make typing easier for disabled persons and requires that you hold down a key for several seconds before it is recognized. Slow Keys is activated by holding down the Return key for more than 5 seconds. You can turn Slow Keys off in the Easy Access control panel or remove Easy Access from the control panel folder altogether and restart the computer.

6) Question: What is a system enabler, why do I need it, and which version should I use?

Answer: A system enabler provides system software code for your specific PowerBook to work with system software. An enabler is not required if you are using a version of the system software that was released after your particular model of PowerBook was released. For instance, if you are using a PowerBook 160 and System 7.5, you do not need a system enabler. If the enabler is needed and is missing, the computer will start up with an error message about the version of the system software being incorrect. The correct enabler can usually be found in the System Folder on the Disk Tools disk that came with the PowerBook.

7) Question: I just installed a screen saver but I've noticed that after the

screen saver kicks in, it slows down significantly. What is causing this?

Answer: It is most likely the case that processor cycling is activating and causing the screen saver to slow down. For instructions on turning processor cycling off, see the question below.

8) Question: What is processor cycling and how do I turn it off?

Answer: All PowerBook models implement a feature called processor cycling (formerly known as processor rest) intended to save battery life. This feature activates when the computer detects that the keyboard, mouse, trackball, or Trackpad has not been used for more than a few seconds. At this time, the processor speed is reduced to about 3 MHz and all processing functions become extremely slow. Processor cycling will not activate while the computer is doing any sort of data transfer.

Note that by default processor cycling is on, and although it is intended to for battery life conservation, it will also activate while running off AC power.

The method of turning off processor cycling will depend on the version of the system software you are using:

System 7.0.1

=====

Step 1

Open the Portable control panel.

Step 2

While holding down the Option key, click on the word "Minutes".

Step 3

Select Don't Rest and click OK.

System 7.1

=====

Step 1

Open the PowerBook control panel.

Step 2

While holding down the Option key on the keyboard, click the Options... button in the control panel.

Step 3

Select "Don't allow cycling".

System 7.5 or later
=====

Step 1

Open the PowerBook control panel.

Step 2

Make sure the toggle switch in the control panel is set to Easy.

Step 3

While holding down the Option key on the keyboard, drag the toggle switch from Easy to Custom and let go.

Step 4

Uncheck the "Allow processor cycling - more battery savings" checkbox.

9) Question: What does the Assistant Toolbox extension do?

Answer: The Assistant Toolbox extension adds several features and functionalities to a PowerBook:

* Battery Management

The Assistant Toolbox adds to the base system's ability to manage battery life.

* Persistent RAM disk

Gives the PowerBook the ability to save RAM disk data to the hard disk when shutting down and read it back in when starting up. Normally, a RAM disk is lost when the PowerBook is completely shut down.

* Sleep Fkey

Using the key sequence Command (Apple)-Shift-0 (the number), you can quickly put the PowerBook to sleep.

* Later Laser

Later Laser allows deferred printing of documents when the PowerBook is disconnected from a printer or network. When you reconnect, the documents print when the printer is available. Later Laser is only active when a laser printer is chosen.

* SCSI Sleep

SCSI Sleep mounts any previously connected hard drives as a PowerBook comes out of sleep.

* Anti-Submarining Cursor

The Anti-Submarining Cursor feature is a software fix for the "submarining" cursor effect on the gray-scale passive-matrix screens. "Submarining" is when

the cursor disappears as it is moved quickly. This is an important feature for all passive-matrix gray-scale PowerBooks.

* Always AppleTalk

The Always AppleTalk feature lets you activate AppleTalk without restarting the computer.

All of these features are built in to the Assistant Toolbox extension and are loaded automatically when the extension is loaded.

10) Question: What does PowerBook File Assistant do?

Answer: PowerBook File Assistant, now simply named File Assistant, is a program that can automatically synchronize a file, a folder, or an entire volume between two computers. This program can be very useful for PowerBook owners that often find themselves in the situation where they are maintaining a database on a central computer and then updating the information on the road with the PowerBook. When the user comes back with the updated information, they simply connect the two computers and run the File Assistant program and all files on both computers are up to date and synchronized. The File Assistant program is bundled on the hard drive of all currently available PowerBook computers.

11) Question: I am trying to use PowerBook File Assistant to synchronize two files but I get the error message that they do not have the same creation date. How can I get around this?

Answer: PowerBook File Assistant will not synchronize two files that have the same name but different creation dates. If File Assistant generates this message in error, remove the Assistant Data file from the Preferences folder within the System Folder, and set up the synchronization again.

12) Question: Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook models that have only one serial port (200's, 2300's, 190's, 5300's), the serial port is mapped as a modem port. Under normal conditions this isn't a problem - the internal modem can be used at the same time as a serial device such as a printer is being used. The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to Internal, Compatible, or "Use internal modem instead of modem port". The location of this setting will depend on what version of the modem and system software you have. When the PowerBook is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there's an update.

13) Question: Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

Answer: As discussed in the previous question, a PowerBook with a single serial port (200's, 2300's, 190's, 5300's) introduces some variables to serial printing. Three things must be true to print to a serial printer with a single serial port PowerBook:

Step 1

AppleTalk must be set to inactive in the Chooser or something other than LocalTalk must be selected in the Network control panel.

Step 2

If you have an internal modem you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to External, Normal, or uncheck "Use internal modem instead of modem port" (see above). The location of this setting will depend on what version of the modem and system software you have.

Step 3

When selecting the serial printer in the Chooser, you must select the modem port or the combined printer/modem port. Do not select the printer port.

14) Question: I have connected a 14" display to my PowerBook, but I am only getting a 640 x 400 image on the external monitor. What should I do?

Answer: It sounds like you have video mirroring enabled. Open the PowerBook Display control panel and see if mirroring is on. If so, it generates the same image on both displays. Since many PowerBooks have a screen resolution of 640 x 400, the external monitor mirrors that resolution.

Turn off mirroring, then check your settings in the Monitors control panel. To make your external monitor the main monitor, drag the menu bar in the Monitors control panel from monitor 1 to monitor 2.

15) Question: How do I back up the files on my PowerBook 145B or 150?

Answer: Instructions for backing up the information on the PowerBook 145B or PowerBook 150 are available in the online Apple Technical Information Library. Use the search string "PowerBook 145B and backup" instructions to locate the article "PowerBook 145 & 150: Backup and Restore Instructions." The instructions are also detailed in the User's Guide that comes with both computers.

16) Question: I made a backup of the information on my PowerBook 145B/150 hard drive. Now I would like to restore just one of my control panels. Can I restore a single file from the backup?

Answer: No. The PowerBook 145B and 150 backup does not allow for restoring single files.

17) Question: I did not make a backup of the system software on my PowerBook 145B (or PowerBook 150), and now I think I need to reload the operating system. I do not want to upgrade to System 7.5. Where can I get a new copy of the software that came with my PowerBook?

Answer: You can order a pre-made backup of the operating system for a PowerBook 145B and 150 by contacting Apple at 800-767-2775. A shipping and handling fee will apply.

18) Question: I am upgrading my PowerBook with Express Modem to System 7.5. What version of the Express Modem software should I be using?

Answer: You should upgrade your Express Modem software to at least version 1.5.3. Earlier versions may not work properly with System 7.5.

19) Question: Do I need the Duo Battery Patch?

Answer: The Duo Battery Patch should be installed on any PowerBook Duo 210, 230, or 250 that is using PowerBook Duo Enabler 1.0, and has an Express Modem installed. This is the only configuration of PowerBook Duo which receives any benefit from the presence of the Duo Battery Patch. System software versions 7.1.1 and later do not require the patch.

20) Question: What ColorSync System Profile should I use on my PowerBook?

Answer: If you have a PowerBook 180c, 540c, 5300c, 5300ce use PowerBook 180c Standard.

If you have a PowerBook 165c, 520c, 190cs, 5300cs use PowerBook 165c Standard.

If you have a PowerBook 270c, 280c, 2300c use PowerBook 270c Standard.

Non-color PowerBooks do not use ColorSync.

21) Question: What is an extension conflict and how do I know if I have one?

Answer: The resources that are added to your system software by programs and utilities are typically called extensions or INITs and are kept in the Extensions folder or the Control Panels folder in the System Folder. If these extensions are not completely compatible, they can cause the computer to do strange things.

With PowerBooks, symptoms that are typical of being caused by an extension conflict are: freezing, Type XX errors (where XX is a number), "floating point coprocessor not installed" errors, not coming out of sleep properly, not

auto-dimming the display, not auto-sleeping, not spinning down the hard drive, not reading floppy disks correctly, displaying anomalous information or "garbage" on the screen, getting errors when printing, not accessing external devices, modem not connecting properly or dropping the line, not connecting to a network properly, and many others.

22) Question: How do I troubleshoot an extension conflict?

Answer: If a problem is consistent and "testable," it is very easy to determine if the problem is being caused by an extension conflict.

If you are using System 7.1 or earlier, try starting up the computer with the Shift key held down to turn the extensions off. You should see the message "Welcome to Macintosh, Extensions Off." If the symptoms go away when the extensions are off, then you have an extension conflict.

Identifying the Conflicting Extension:

Step 1

Create a new folder on the desktop called "Removed Extensions."

Step 2

Move all items of Kind "system extension," "control panel," or "Chooser extension" from the System Folder, Extensions folder, and Control Panels folder to this new folder. When you open these folders, choose "by Kind" from the View menu to help identify the files you need to move.

Step 3

Close the System Folder, and restart the Macintosh. Test for the problem.

Note: If the problem still occurs, check your System Folder to make sure you've removed all the extensions and control panels.

Step 4

Move a few items from the new folder on the desktop to the closed System Folder and restart the Macintosh. Make sure you note which items you moved.

Step 5

Attempt to recreate the original problem.

Repeat steps 4 and 5 for each item in the Removed Extensions folder until the problem recurs. The last item returned to the System Folder is likely to be the cause of the problem.

If you are using System 7.5 or later, you have the luxury of having a built-in Extensions Manager in the Control Panels folder. Select the System 7.5 Only set of extensions from the Extensions Manager control panel, then restart. If the

symptoms go away, then you have an extension conflict. You can then use the Extensions Manager to turn a few extensions and control panels off at a time, then restart the computer. When the problem comes back, one of the items you last selected is most likely causing the problem. You can also activate the Extensions Manager by holding down the Space Bar while the computer is starting up.

23) Question: What is zapping the PRAM and when should I do it?

Answer: "Zapping" or resetting the PRAM (parameter RAM) resets most of the information in the PRAM chip to its default value. This chip is powered by the backup battery and is used to hold settings that you want to be set even after the computer has been turned off, such as the time (although the time is not reset when zapping the PRAM). Many control panel settings such as sound, mouse speed, and memory are kept in the PRAM as well as many network, SCSI, and screen settings.

To reset the PRAM, restart the computer and hold down the Command (Apple), Option, P, and R keys. Wait for the computer to make its startup chime twice. You may then release the keys. Be aware that resetting the PRAM will reset such settings as the sound volume and mouse speed to their default value, and will purge the contents of a RAM disk if you are using one.

You should only reset the PRAM if you are having a problem that you think could be caused by corrupted information in the PRAM chip. A good tip that the PRAM might be corrupted is if a certain control panel won't hold it's setting or isn't operating correctly, the computer is having trouble printing, or there is a problem with networking.

24) Question: Where else can I go for answers?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Technical Information Library (TIL). This library contains thousands of technical articles which are easily searchable using boolean search strings.

PowerBook 200 series: Frequently Asked Questions (4/97)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 04 April 1997

TOPIC -----

This document contains the answers to the following frequently asked questions (FAQ) about PowerBook (Duo) 200 series computers.

- 1) What is a PowerBook Duo?
- 2) Do I need to buy a dock?
- 3) What are the differences in the different Duo Docks that Apple has sold?
- 4) I have an Apple Multiple Scan 17" monitor connected to an original Duo Dock but the only resolution I'm getting is 640x480. What's going on?
- 5) My external monitor is not displaying an image when I start up my PowerBook.
- 6) Before connecting a MiniDock, should the PowerBook be on, off, or sleeping?
- 7) My PowerBook display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?
- 8) Sometimes when using my PowerBook in a Duo Dock, the mouse will freeze even though the system is still working. I know the system is still working because I can see the clock in the corner ticking away. How can I fix this?
- 9) I just bought a Duo Dock with an internal hard drive. When I tried to start up my PowerBook in the dock, I got a flashing question mark on the screen, yet the PowerBook starts up fine on its own. Why is this?
- 10) When starting up, my PowerBook with Express Modem displays the Fax Modem extension icon with an "X" through it. I can't use my modem to send a fax. What's wrong?

11) Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

12) Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

13) I am upgrading my PowerBook 200 series computer with Express Modem to System 7.5. What version of the Express Modem software should I be using?

14) Do I need the Duo Battery Patch?

15) I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen.

16) I'm trying to connect my Duo as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.

17) Are current dock products, modems, and RAM compatible with a PowerBook 200 series computer upgraded to PowerPC?

18) Can the Duo be inserted into the Duo Dock while in sleep mode?

19) Where else can I go for answers?

DISCUSSION -----

1) Question: What is a PowerBook Duo?

Answer: A PowerBook Duo is Apple's smallest and lightest PowerBook computer. Unlike most other PowerBooks, it has no floppy disk drive, no SCSI port, no external video out port, no audio in or out ports, and no ADB port for external mice or keyboards. It does have a serial port, phone jack (with internal modem), and a 152-pin 32-bit PDS (processor direct slot) in the back.

The PDS allows docks to connect directly to the PowerBook Duo's logic board. These adapters let you add further expansion to the Duo - something you can't do with any other PowerBook. You can add Ethernet, video output, SCSI, PCMCIA, more serial ports, audio in/out, and more.

The beauty of a PowerBook Duo is that it allows the user the freedom of using the same computer in functionally different environments. You might have a Duo Dock II at home with a 17" monitor, a printer, and several SCSI devices connected, allowing you to use the computer just like any other desktop Macintosh. When it's time to go to the office/library/park, you simply eject the PowerBook from the dock, and you have the same processing power in a ~5 pound computer the size of a textbook.

2) Question: Do I need to buy a dock?

Answer: No. If you live or work in an environment where you have networked

access to other computers, you can always install software via a "net install." The only time you will absolutely need a floppy disk drive is if a system file gets corrupted and the computer will not start up. Then you will need a floppy disk drive to start the computer from a Disk Tools disk. But even in this situation, an Apple dealer can restore the system for a fee.

If you regularly use SCSI devices, multiple serial devices, external monitors, external ADB devices, and audio devices, then you will probably want to get a MiniDock or a full Duo Dock to compliment your PowerBook Duo.

3) Question: What are the differences in the different Duo Docks that Apple has sold?

Answer: There have been three implementations of the full Duo Dock from Apple: the Duo Dock, Duo Dock II, and Duo Dock Plus. As of this writing, the Duo Dock II and Duo Dock Plus are the only full dock products available from Apple. All three versions can potentially have 1 MB of VRAM, an internal SCSI hard drive, and all versions have the same expansion ports - video, audio in/out, ADB, SCSI (HDI-30), two serial ports, two NuBus slots, and a phone jack for the modem.

The Duo Dock Plus and Duo Dock II come with 1 MB of VRAM standard. The original Duo Dock came with 512k VRAM soldered but can be upgraded to 1 MB by installing a 512k VRAM SIMM.

The Duo Dock II comes standard with a 32k RAM cache and a math coprocessor (FPU) installed, an FPU can be added to the original Duo Dock. An FPU is not an option on the Duo Dock Plus. Note that the PowerBook Duo 280 and 280c cannot take advantage of an FPU in any Duo Dock or the 32k RAM cache in the Duo Dock II because they use the 68LC040 processor. The Duo Dock II and Duo Dock Plus can support screen sizes up to 1024x768 at 256 colors while the original Duo Dock (even with 1 MB of VRAM) can only support up to 832x624 at 256 colors.

4) Question: I have an Apple Multiple Scan 17" monitor connected to an original Duo Dock but the only resolution I'm getting is 640x480. What's going on?

Answer: The Apple Multiple Scan monitors can only switch screen resolutions on the fly on the original Duo Dock if System 7.5 (or later) is installed. A display adapter is available from Enhance Cable Technologies that will "trick" the Duo Dock into using the 832x624 screen size, but this size will still be fixed, i.e. the adapter would need to be removed to go back to 640x480. The Duo Dock II and Duo Dock Plus can switch resolutions regardless of which operating system they are running and do not need any display adapter.

5) Question: My external monitor is not displaying an image when I start up my PowerBook.

Answer: Follow this procedure:

Step 1

Shut down the PowerBook.

Step 2

Make sure the video cable connected to both the PowerBook video port and the Monitor video port is secure.

Step 3

Make sure the PowerBook is plugged into the AC Adapter, which is required to use an external monitor.

Step 4

Start up the PowerBook and open the Monitors control panel. You should see images of two monitors, representing the PowerBook display and the external monitor. If you don't see the image of the external monitor, repeat steps 1 and 2.

Step 5

In the Monitors control panel, click (and hold) the "Identify" button. A large 2 should be displayed on the external monitor icon.

Tip: If you wish to use the external monitor as your primary monitor, open the Monitors control panel and drag the menu bar from the top of the internal display (labeled 1) to the top of the external monitor (labeled 2).

6) Question: Before connecting a MiniDock, should the PowerBook be on, off, or sleeping?

Answer: Do not try to connect the MiniDock to the PowerBook while the PowerBook is on. At best the PowerBook will shut off, at worst you will damage the logic board.

The PowerBook can be in sleep mode if you are connecting to a MiniDock with serial, ADB, audio, or modem connections.

The PowerBook should be off if you are connecting to a MiniDock with SCSI devices or a monitor connected.

7) Question: My PowerBook display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?

Answer: The technology used on the passive-matrix displays is susceptible to shadowing and ghosting, since it does not individually address each pixel on the display. Gray-scale passive-matrix displays are particularly susceptible to the symptoms. The PowerBook 100, 140, 145, 145B, 150, 160, 165, 210, 230, 520, 190, and 5300/100 all use a gray-scale passive-matrix display.

Some suggestions to reduce the effects of the shadowing:

- * Adjust the brightness and contrast settings of the display. Usually a lighter contrast setting will look better.

- * Use a darker desktop pattern. The effects of the shadowing will not be as apparent with the darker background.

- * Open the Monitors control panel and select "Black & White" instead of 16 Shades of Gray.

Although these tips can help mitigate the effects of the shadowing, some amount of screen anomalies will always be present.

8) Question: Sometimes when using my PowerBook in a Duo Dock, the mouse will freeze even though the system is still working. I know the system is still working because I can see the clock in the corner ticking away. How can I fix this?

Answer: Older PowerBook models had an issue with ADB devices cutting out when connected to a Duo Dock. If you are using System 7.1, make sure you have the PowerBook Duo Enabler v1.0 installed in the System Folder to correct the problem, this enabler is installed by the System Update 3.0. System software versions after 7.1 do not have this problem.

9) Question: I just bought a Duo Dock with an internal hard drive. When I tried to start up my PowerBook in the dock, I got a flashing question mark on the screen, yet the PowerBook starts up fine on its own. Why is this?

Answer: The version of the hard drive driver on the Duo Dock hard drive is having a conflict with the hard drive driver on the PowerBook hard drive. As a temporary fix you can hold down the Command (Apple) key while the computer is starting up to force it to boot correctly. The permanent fix is to update both drivers to the same version using a recent (System 7.1.1 or later) Disk Tools disk.

10) Question: When starting up, my PowerBook with Express Modem displays the Fax Modem extension icon with an "X" through it. I can't use my modem to send a fax. What's wrong?

Answer: Open the Preferences folder inside your System Folder and trash the Fax Preferences file, empty the Trash, and restart your PowerBook. The Fax Preferences file can be corrupted due to a system error or screen freeze, disabling the Fax Modem extension as a result.

11) Question: Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook models that have only one serial port (200's, 2300's, 190's, 5300's), the serial port is mapped as a modem port. Under normal

conditions this isn't a problem - the internal modem can be used at the same time as a serial device such as a printer is being used. The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to Internal, Compatible, or "Use internal modem instead of modem port". The location of this setting will depend on what version of the modem and system software you have. When the PowerBook is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there's an update.

12) Question: Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

Answer: As discussed in the previous question, a PowerBook with a single serial port (200's, 2300's, 190's, 5300's) introduces some variables to serial printing. Three things must be true to print to a serial printer with a single serial port PowerBook:

Step 1

AppleTalk must be set to inactive in the Chooser or something other than LocalTalk must be selected in the Network control panel.

Step 2

If you have an internal modem you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to External, Normal, or uncheck "Use internal modem instead of modem port" (see above). The location of this setting will depend on what version of the modem and system software you have.

Step 3

When selecting the serial printer in the Chooser, you must select the modem port or the combined printer/modem port. Do not select the printer port.

13) Question: I am upgrading my PowerBook 200 series computer with Express Modem to System 7.5. What version of the Express Modem software should I be using?

Answer: You should upgrade your Express Modem software to at least version 1.5.3. Earlier versions may not work properly with System 7.5.

14) Question: Do I need the Duo Battery Patch?

Answer: The Duo Battery Patch should be installed on any PowerBook Duo 210, 230, or 250 that is using PowerBook Duo Enabler 1.0, and has an Express Modem installed. This is the only configuration of PowerBook Duo which receives any

benefit from the presence of the Duo Battery Patch. System software versions 7.1.1 and later do not require the patch.

15) Question: I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen.

Answer: You are most likely using the wrong SCSI cable. You should be using the HDI-30 SCSI System Cable (M2538LL/A), which is a light gray color and only has 29 pins (there is a pin missing). You are most likely using the HDI-30 SCSI Disk Adapter cable (M2539LL/A) which is dark gray and has all 30 pins.

16) Question: I'm trying to connect my Duo as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.

Answer: You may have the wrong cable. Use the Apple HDI-30 SCSI disk adapter cable, part number M2539LL/A, in conjunction with an Apple SCSI System Cable appropriate to your other Macintosh along with proper SCSI termination.

17) Question: Why does my trackball appears to "stick" or "jump" when rolled? I tried to clean it but it is not smooth.

Answer: Most PowerBook trackball problems are due to contamination of the rollers. The trackball is just like the standard Apple mouse in that dust and debris can accumulate on the rollers and impede smooth movement of the trackball.

Symptoms of a Dirty Trackball

=====

Symptoms that your trackball is dirty are:

- * The trackball appears to "stick" or "jump" when rolled.
- * The cursor will not track horizontally or vertically.
- * It sometimes seems like the cursor is "hitting a wall."
- * The movement of the cursor on the screen isn't smooth.
- * The trackball is physically difficult to roll.

How to Clean the Trackball

=====

Step 1

Remove the trackball retaining ring by turning it counterclockwise until it pops out (about 1/4 turn). You don't need tools for this; you can just press against the two small ridges on the ring with your fingernails.

Step 2

Lift the retaining ring and trackball out of its cavity.

Step 3

Locate the small rubber rollers at the left and bottom sides of the trackball cavity. Depending on your model, they may look like small rings or wheels.

Step 4

Use any reasonably clean, blunt object (such as your finger or a cotton swab) to wipe off the rollers. Do not use any liquid, including any amount of cleaning fluid or water, inside the computer.

Step 5

Locate the three bearings located at approximately clockwise 4:00, 7:00, and 11:00. Using a fingertip, dry cotton swab, or other blunt object, clean them of any debris.

Step 6

Replace the trackball and the retaining ring.

17) Question: Are current dock products, modems, and RAM compatible with a PowerBook 200 series computer upgraded to PowerPC?

Answer: Most, if not all docking products, internal modems, and RAM used with a PowerBook 200 series should still be compatible after the PowerPC 603e upgrade. All Apple products are. Check with the vendor of third-party products to be sure.

18) Question: Can the Duo be inserted into the Duo Dock while in sleep mode?

Answer: The Duo can be inserted into the Duo Dock while in sleep but the Duo will be ejected when the Duo Dock is powered on. When you bring the Duo out of sleep mode a dialogue box will appear informing you the Duo must be shut down, not in sleep mode, before it is inserted into the Duo Dock.

19) Question: Where else can I go for answers?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Technical Information Library (TIL). This library contains thousands of technical articles which are easily searchable using boolean search strings.

AppleVision 1710AV Display: Description (8/95)

Article Created: 20 July 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

This article gives a description of the AppleVision 1710AV Display.

DISCUSSION -----

Overview

=====

The AppleVision 1710AV is an exceptional audiovisual display designed with the mainstream business user in mind but well-suited to a wide variety of tasks, including desktop publishing and work with multimedia. An appropriate choice for those who require flexibility in a display, it combines multiple-scan capabilities with the next-generation Trinitron tube, offers a host of advanced Apple DigitalColor technology features, and boasts built-in speakers and a microphone. And it features plug-and-play compatibility with DOS and Windows software-based computers as well as Macintosh and Power Macintosh systems.

Image quality is the first concern of anyone buying a monitor, and the AppleVision 1710AV is outstanding in this area. It features internal self-calibration technology—eliminating the need to spend time and money to maintain accurate color calibration. The AppleVision 1710AV provides automatic screen-to-print matching using Apple's unparalleled ColorSync 2.0 technology. It can also be adjusted to compensate for many of the effects of ambient lighting and CRT aging. And its intuitive Macintosh software provides control over all screen functions, including geometry, brightness, contrast, and variable color temperature.

But beyond outstanding image quality, the AppleVision 1710AV has something unique to offer: integrated multimedia features that provide unprecedented performance and capabilities. Its built-in stereo speakers let you enjoy high-quality CD sound without having to give up any of your valuable desk space. And its directional microphone—capable of voice recognition—lets you annotate documents, as well as take full advantage of applications that utilize speech.

The AppleVision 1710AV is based on the next generation of Trinitron technology, which means that it offers an extremely vivid, sharp picture—as well as being incredibly easy on the eyes. And its multiple-scan technology gives you the flexibility you need, letting you view more than two full pages of information at a time at an impressive 1,280 by 1,024 pixels.

Vivid, accurate color, outstanding multimedia capabilities, and flexibility—the AppleVision 1710AV brings it all to your desktop, to put you in the vanguard of the multimedia revolution.

Features

=====

Outstanding image quality

- Features next-generation Trinitron technology for clear, sharp pictures and vivid color
- Provides outstanding color matching and extremely accurate on-screen color representation
- Adjusts luminance and color temperature to provide outstanding image quality
- Keeps colors accurate and balanced over time, by compensating for ambient lighting and CRT phosphor aging

Advanced functionality

- Uses multiple-scan electronics that enable a high level of user flexibility
- Offers a range of resolution modes—up to 1,280 by 1,024 pixels
- Features built-in intelligence, to ensure that your monitor remains calibrated
- Provides intuitive software control over all screen functions

Multimedia integration

- Provides high-quality stereo sound
- Includes a directional microphone capable of voice recognition
- Is completely integrated with all Macintosh computers that feature Apple AV Technologies, to provide a complete multimedia computing solution

Compatibility

- Works with MS-DOS and Windows software-based systems, as well as with the full line of Macintosh and Power Macintosh computers
- Supports plug-and-play connection to both Apple computers and PCs running MS-DOS and Windows

Configuration and Ordering

=====

AppleVision 1710AV Display

Order No. M3323LL/A

- AppleVision 1710AV
- AppleVision software
- PC adapter

- Integrated, attached video and Apple Desktop Bus (ADB) cable
- Integrated audio input/output cable
- Power jumper cable
- Ambient light wand
- User's Guide
- Limited warranty

AppleVision 1710AV Display: Technical Specifications (10/96)

Revised: 11/14/96
Security: Everyone

AppleVision 1710AV Display: Technical Specifications (10/96)

Article Created: 20 July 1995
Article Reviewed/Updated: 14 November 1996

TOPIC -----

This article gives the technical specifications for the AppleVision 1710AV Display.

DISCUSSION -----

Picture tube

- 17-inch (16.1-inch diagonal viewable image size) Trinitron CRT
- Multiple Scan
- Resolution Range: 640 X 480 To 1280 X 1024

Screen

- Antistatic, antiglare surface treatment
- 0.26 millimeter (mm) stripe pitch

Input signals

- Red, Green, and blue signals; separate sync, composite sync, and composite video

Power savings features

- Conforms to the Energy Star Program of the United States Environmental Protection Agency
- Power saving feature compatible with Video Electronics Standards Association (VESA) Display Power Management Standard (DPMS)

Scanning Rates

- 30 Khz To 82 Khz (horizontal)

- 50 Hz To 120 Hz (vertical)

Apple Digitalcolor Technology Features

- Self-calibration against factory measurements
- Adjustment For Ambient Lighting
- Adjustment for CRT phosphor aging

User Controls

- Power-on switch
- Automatic degauss at power-up; manual degauss by turning Power Switch OFF, then ON (capable of full degauss after monitor is turned OFF For 20 minutes or more)
- Control buttons: Brightness, contrast, bass, treble, microphone, volume, and mute
- Additional picture and sound controls available using The Applevision Setup Control Panel (macintosh Users) Or On-screen Controls (ibm Pc-compatible Users)

Active Video Image Area

- Adjusted at the factory for the following standard modes:

Begin_Table

Mode	Resolution	Vertical Refresh Rate (hertz)	Horizontal Scan Rate (kilohertz)
VGA	640x480	59.95	31.47
Macintosh	640x480	66.70	35.00
VESA	640x480	75.00	37.50
VESA	800x600	75.00	46.90
SVGA	800x600	55.98	35.16
SVGA	800x600	60.00	37.80
Macintosh	832x624	75.00	49.73
XGA	1024x768	75.00	60.20
Macintosh	1024x768	75.00	60.20
	1024x768	60.00	48.30
	1280x1024	75.00	80.00

End_Table

Audio Input Signals

- Accepts audio signal of up to 6 Vpp (line level-low sensitivity) or as low as 20 mVpp (microhpone level-high sensitivity) without clipping the signal, depending upon the level and sensitivity setting.

Microphone

- Directional, optimized for use in speech recognition and other voice-related applications

Speakers

- Stereo, with ported (bass reflex) chamber design
- Maximum Loudness: 90 dB SPL at 1 kHz at 0.5 meters
- Frequency Response: 100 Hz To 17 Khz +/- 3 dB
- 13 Ohms
- 3 Watts

Headphone Jack

- Output Level: 1.75 Vpp Into 4-Ohm load and 2 Vpp into 10k-ohm load

Input Electrical Requirements

- Voltage: 90 to 132 V AC and 198 to 264 V AC
- Frequency: 47 to 63 Hz, single phase
- Power: 150 W maximum when operating; less than 11 W in standby mode; 0 W in suspend mode and when CPU is in energy-saver mode

Weight

Approximately 60 Pounds (27 Kilograms)

Size and Weight

Height: 19.7 in.(50.7 cm)
Width: 15.8 in.(40.5 cm)
Depth: 17.6 in.(45.2 cm)
Weight: 60 Pounds (27 Kilograms)

Interfaces

- Apple Desktop Bus (ADB): One input port and two ADB pass-thru output ports
- Microphone: One input port and one pass-thru output port
- Headphone/speaker: One input and one pass thru output port

Operating Environment

=====

Temperature

- Operating: 50 to 104 degrees F (10 to 40 degrees C)
- Storage: 32 to 140 degrees F (0 to 60 degrees C)
- Shipping: -40 to 151 degrees F (-40 to 65 degrees C)

Humidity (noncondensing)

- Operating: 10% To 80%
- Storage: 5% To 90%
- Shipping: 5% To 95%

Altitude (maximum)

Operating: 0-10,000 ft. (3,048 M)

Shipping: 0-35,000 ft. (10,670 m)

System Requirements

=====

- Power Macintosh, Macintosh Quadra (and corresponding Macintosh LC and Performa models), Macintosh Centris, Macintosh II (with video card), and PowerBook computers.

Note: Not all models and configurations are capable of driving the monitor to the highest resolution it supports

- System software version 7.1 or later

Monitor Cable Specifications

=====

- 15-pin DSub connector for Macintosh systems
- 15-pin DSub mini-adaptor for PC's

Monitor Signals

=====

Pin	Output Signal
---	-----
1	Red video ground
2	Red video
3	Not used
4	ID 1
5	Green video
6	Green video ground
7	ID 2
8	Not used
9	Blue video
10	ID 3
11	V sync return
12	V sync
13	Blue video ground
14	H sync return
15	H sync
Shell shield ground

Macintosh Performa 6100: Frequently Asked Questions (12/95)

Revised: 12/20/96
Security: Everyone

Macintosh Performa 6100: Frequently Asked Questions (12/95)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 04 December 1995

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Macintosh Performa 6100 series computers.

Questions in this FAQ:
=====

- 1) What is the difference between native software and conventional software?
- 2) I bought a Macintosh Performa 6100 series computer and added an AV card. Can I get software that supports the video digitizer?
- 3) My computer does not remember sound settings from restart to restart. I continually have to go back to the Sound control panel and reset the CD input source.
- 4) What causes Type 11 errors?
- 5) Does my Power Macintosh have an FPU? I see errors that an FPU is not installed.
- 6) Can you install the Apple TV/Video System in a Performa 6115?
- 7) What is the difference between a Power Macintosh 6100 and a Macintosh Performa 6100 series computer?
- 8) I need to run DOS software on my Performa 6100 series computer. What are my options?
- 9) My microphone from my LC II does not work on my Performa 6100 series computer. What's wrong?

10) I have an old program which tells me to turn off 32-bit addressing. But I don't see this as an option in my Memory control panel. Why?

11) The sound from my 15" Multiple Scan Display is very low. Sometimes, I can only hear sound out the left speaker. What is wrong?

12) I have a Macintosh Performa computer which was shipped with a CD-ROM. I have purchased a third-party disk management utility or virus detector which states I should use a "Disk Tools" disk in order to create an emergency disk. I did not receive one with my computer. Should I have?

DISCUSSION -----

1) Question: What is the difference between native software and conventional software?

Answer: The Power Macintosh runs in two modes, without any further assistance from the user: it can run "native" software, which is software written for the PowerPC chip, or "conventional" software, which is software written for an older 68000, 68020, 68030, or 68040-based computer. Conventional software is sometimes referred to as "68K" software.

Conventional software runs in an "emulation" mode, which is functionally similar to the 68020 processor. The main differences between this processor and later processors are: (a) it does not have a PMMU (Paged Memory Management Unit), (b) it does not support the SWAP16 instruction, and (c) it does not support a floating point unit. The first point is necessary because the PowerPC has a newer, better, memory management model. The second point is also addressed by improvements in the PowerPC chip. The third point requires different steps to work around; see the FAQ question below. Conventional software will generally run faster than a 68020, probably between Macintosh IIci and Quadra 605 performance, depending on how many references the software makes to the native "toolbox" in the computer.

As new software is sold, you will find reference to "Fat" applications. These are programs that can be run on either a 68K or Power Macintosh computer without modification. The operating system automatically determines which part to use.

Since "Fat" applications are really two programs in one, many installers will offer either a "Power Macintosh" or "Conventional" install. If you have installed a software billing itself as "Accelerated for Power Macintosh" and, once installed, it does not recognize features which definitely exist, such as an FPU, make sure you have installed the correct version and build. Both versions will run on the Power Macintosh, but only the "native" version will benefit from all the special features of the Power Macintosh.

2) Question: I bought a Macintosh Performa 6100 series computer and added an AV card. Can I get software that supports the video digitizer?

Answer: You should contact the Apple Assistance Center at 800-538-9696. They can determine what software you are entitled to receive with the card.

3) Question: My computer does not remember sound settings from restart to restart. I continually have to go back to the Sound control panel and reset the CD input source.

Answer: If the Sound Preferences file, which stores much of this information, is corrupted, the settings may not be getting saved. To resolve this, open your System Folder, then your Preferences folder. Throw away Sound Preferences, and restart. Try to reproduce the problem.

If you have installed any type of disk compression or disk management software, check to make sure that it is not manipulating any of your Preferences files.

4) Question: What causes Type 11 errors?

Answer: Type 11 errors are typically due to one of a variety of factors:

- Font problems: you are using a bad font.
- RAM problems: you've installed bad RAM.
- SCSI chain problems: bad driver or cable.
- Cache SIMM problems (if you have installed one on your Performa computer).
- Incompatible software running in emulation.

For steps on how to troubleshoot such problems, see the referenced Technical Information Library article.

The online Apple Technical Info Library (go shortcut "TIL") - use the search string "meaning of error type 11 and power macintosh" to locate the article "Power Macintosh: Meaning of Error Type 11".

5) Question: Does my Power Macintosh have an FPU? I see errors that an FPU is not installed.

Answer: All PowerPC chips, which are used on Power Macintosh computers, have a floating point unit.

You may be seeing the "FPU not installed" error for two reasons:

- You are running "conventional" software in 68K emulation. This operating mode does not provide access to the computer's floating point unit. Thus, the program does not work. Certain software "bridges" exist to allow conventional software access to the PowerPC's FPU. See the Redgate Communications area to search for such products.
- You are using software, in either emulation or native mode, which is simply failing. Since the PowerPC supports pipelining instructions, a number of errors are occurring simultaneously. They are eventually percolating out as an "FPU not installed" error. An error did occur, but it has nothing whatsoever to do with

the need for a floating point unit. You should apply standard troubleshooting steps to resolve this issue.

6) Question: Can you install the Apple TV/Video System in a Performa 6115?

Answer: No. The Apple TV/Video System is designed for the Performa 630 series of computers.

You can, however, install an Apple AV Technologies Video Card in the Performa 6115.

7) Question: What is the difference between a Power Macintosh 6100 and a Macintosh Performa 6100 series computer?

Answer: The Macintosh Performa 6100 series computers use the basic architecture of a Power Macintosh 6100/60. They all include CD-ROM drives, while CD-ROM drives are optional equipment on a Power Macintosh. Different Performa models come with different sized hard disks, depending on the market. Performas also come with a variety of software and CD bundles, while the Power Macintosh computers only come with the basic system software. All Performas come with a Global Village Gold II modem, while Power Macintosh computers do not come with any at all. And all Performas come with a 15" Multiple Scan Display, while Power Macintosh users are free to choose their own monitor.

As you can conclude from the above, the Performas are popular with people just starting out with computing, or who have needs that can be nicely satisfied by a complete bundle. Power Macintosh computers are favored by people who may have hardware or software left over from a previous computer, or who have very specific applications they wish to use, and who wish to "build" their own, custom configuration.

8) Question: I need to run DOS software on my Performa 6100 series computer. What are my options?

Answer: There are two ways to run DOS software:

- Use Insignia Solutions' SoftWindows emulator. This is a Macintosh application which emulates a PC DOS/Windows environment. You can get more information, such as pricing, performance, system requirements, and compatibility information from Insignia by calling them at 800-877-4292.
- You can use the Apple DOS Compatibility Card. This is a hardware solution, providing a 486 DX2 processor running at 66 MHz, SoundBlaster support, alternative video support, and up to 32 MB of on-board memory. This effectively produces a "dual processor" environment for your computer, in which Macintosh and DOS applications can run at full processor efficiency, simultaneously.

This card plugs into your single Processor Direct Slot. If you opt to use this card, you will not be able to use other PDS cards, such as an Apple AV Technologies Card, without removing this card, first.

9) Question: My microphone from my LC II does not work on my Performa 6100 series computer. What's wrong?

Answer: The microphone used with an LC II is called the Apple Omnidirectional Microphone. It comes with a 1/2" plug. The one used with the Performa 6100 series computers (as well as all Power Macintosh computers, the Performa 475/6, 500 series computers, 600 series computers, and Quadra 660AV and 840AV) is called a PlainTalk microphone. It has a 3/4" plug, the extra 1/4" of which is to reach a power source which drives an internal amplifier in the microphone.

You need to get a PlainTalk microphone. Our part number is M9060Z/A. You can order this through many Apple-authorized service providers and catalog resellers. Their numbers can be obtained by contacting our 24-hour referral service, 800-538-9696.

The online Apple Technical Info Library (go shortcut "TIL") - use the search string "plaintalk microphone" to locate the article "Macintosh: PlainTalk Audio Port Microphone Support".

10) Question: I have an old program which tells me to turn off 32-bit addressing. But I don't see this as an option in my Memory control panel. Why?

Answer: The Power Macintosh always runs in 32-bit mode. There is no way to turn it off; therefore, there is no switch in the Memory control panel.

11) Question: The sound from my 15" Multiple Scan Display is very low. Sometimes, I can only hear sound out the left speaker. What is wrong?

Answer: Most likely, the cable is not plugged in securely on the monitor's side. Remove it, then plug it back in, firmly. If this does not help, completely unplug the cable from both the Macintosh side and the monitor side, then exchange the ends.

You may also wish to check your "Volumes" setting in the Sound control panel. Select "Control Panels" from the Apple menu, then open the Sound control panel. You will see a window which lets you set your alert volumes. Click on the pop-up menu at the top of the window, then select "Volumes." Make sure your speaker volume is set to a non-low value.

12) Question: I have a Macintosh Performa computer which was shipped with a CD-ROM. I have purchased a third-party disk management utility or virus detector which states I should use a "Disk Tools" disk in order to create an emergency disk. I did not receive one with my computer. Should I have?

Answer: Apple currently ships a CD-ROM drive as part of many Performa computers. If you received a Macintosh Performa CD as part of your bundle, that effectively replaces a conventional Disk Tools disk: in addition to containing conventional disk diagnostic software, it also contains a complete back-up of your system.

In many cases, you can still use the Performa CD as a start-up disk, then insert a diskette containing whatever disk-based software you need to run.

If the software you are using does not support the use of a Performa CD, or does not contain instructions on how to use the Performa CD with that product, you should contact the manufacturer of the software for further assistance.

Article Change History:

04 Dec 1995 - Added keyword.

20 Nov 1995 - Revised title.

02 Nov 1995 - Updated Type 11 error search string.

Apple Multiple Scan 14 Display: Description (8/95)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

This article gives a description of the Apple Multiple Scan 14 Display.

DISCUSSION -----

The Apple Multiple Scan 14 Display (14-inch picture tube; 12.4-inch diagonal viewable image size) is a high-quality color monitor designed to be the optimal solution for working with today's multimedia applications. Surprisingly affordable, it combines the flexibility of multiple-scan technology with the multimedia advantage of built-in stereo speakers to give you an outstanding price/performance value.

Because the Apple Multiple Scan 14 Display uses multiple-scan technology, you can choose between different resolutions, giving you the flexibility to adjust your display to suit the particular application in which you are working—without restarting your computer. And the display's integrated front-panel stereo speakers and easy-access headphone jack let you get the most out of multi-media applications that feature compelling color images and sound.

The Apple Multiple Scan 14 Display is both simple to set up and enjoyable to use. Its conveniently located front-panel controls make it an easy task to adjust brightness and contrast for optimal viewing convenience. Its 0.28-millimeter dot pitch provides an exceptionally clear, sharp image. And it complies with the Environmental Protection Agency's Energy Star guidelines for power conservation.

Yet even with all of these features, the Apple Multiple Scan 14 Display remains affordable—making it the perfect choice for users who want a flexible, multimedia-ready, color viewing solution.

Features
=====

Outstanding image quality

- Offers industry-leading dot pitch of only 0.28 mm for clean, crisp images
- Features a shadow mask screen for clear pictures with true colors
- Degausses automatically and conveniently at startup to ensure equal distribution of colors

Multimedia integration

- Incorporates stereo speakers to get the most out of today's multimedia applications
- Provides an easy-access front-panel headphone jack for private listening

Ergonomic design

- Comes with a tilt-and-swivel base that allows you to position the monitor for optimal viewing comfort
- Provides the convenience of front-panel controls
- Features a flicker-free 72-hertz refresh rate to minimize eyestrain
- Complies fully with MPR II standards for low electrical and magnetic emissions
- Complies with the EPA's Energy Star conservation guidelines by switching into low-power mode during idle periods

Advanced functionality

- Uses multiple-scan electronics that enable a high level of user flexibility
- Offers user-adjustable resolution modes: 640 by 480 pixels and 800 by 600 pixels with various refresh rates
- Comes with mode-switching software to allow resolution changes without restarting

Compatibility and affordability

- Works with Power Macintosh, Macintosh Quadra, Macintosh Centris, Macintosh Performa, Macintosh II, and PowerBook computers,
- Provides advanced capabilities at an affordable price

Configuration and Ordering

Apple Multiple Scan 14 Display: Technical Specifications (2/96)

Article Created: 20 July 1995
Article Reviewed/Updated: 29 February 1996

TOPIC -----

This article gives the technical specifications for the Apple Multiple Scan 14 Display.

DISCUSSION -----

Picture Tube

- 14-inch diagonal shadow mask, 12.36-inch viewable image size (measured diagonally)
- Multiple scan
- Resolution range: 640 x 480 to 800 x 600

Screen

- .28 millimeter (mm) dot pitch

Active Display Area

- 250 mm x 190 mm

Scanning Rates

- 31.5 to 48.1 kHz (horizontal)
- 60 to 72 Hz (vertical)

Input Signals

- Red, green, and blue signals; separate sync.

Power Savings feature

- Conforms to the Energy Star program of the United States Environmental Protection Agency

User Controls

- Power-on switch
- Automatic degauss at power-up; manual degauss by turning power switch off, then on (capable of full degauss after monitor is turned off for 20 minutes or more)
- Controls: brightness, contrast, horizontal shift, vertical shift, horizontal size, vertical size

Active Video Image Area

Adjusted at the factory for the following standard modes:

Begin_Table

Mode	Resolution	Vertical Refresh Rate (hertz)	Horizontal Scan Rate (kilohertz)
-----	-----	-----	-----
VGA	640x480	60.0	31.5
Macintosh	640x480	66.7	35.0
SVGA	800x600	72.0	48.1
SVGA	800x600	60.0	37.9
Macintosh	832x624*	75.0	49.7

End_Table

* M3935LL/A versions of this display do not support this resolution.

Input Electrical Requirements

- Voltage: US version: 90-132 V AC
European version: 198-264 V AC
- Frequency:
US version: 57-63 Hz
European version: 43-53 Hz
- Power: 80 W maximum when operating, less than 11 W in energy-saver mode

Size and Weight

- Height: 14.9 in. (37.8 cm)
- Width: 14.4 in. (36.5 cm)
- Depth: 15.2 in. (38.6 cm)
- 25 pounds (11.3 kg)

Interfaces

- Headphone/Speaker: One input and one pass thru output port

Operating Environment

=====

Temperature

- Operating: 50 to 104 degrees F (10 to 40 degrees C)
- Storage: 32 to 140 degrees F (0 to 60 degrees C)
- Shipping: -40 to 151 degrees F (-40 to 65 degrees C)

Humidity (noncondensing)

- Operating: 20% to 95%

Altitude (maximum)

- Operating: 0-10,000 ft. (3,000 m)
- Shipping: 0-5,000 ft. (4,500 m)

System Requirements

=====

- Power Macintosh, Macintosh LC, Macintosh Quadra, Macintosh Centris, Macintosh Performa, Macintosh II, and PowerBook computers
- System software version 7.1 or later
- Compatible display card required for use with Macintosh II. Cable adapter required for use with some Macintosh LC, Macintosh Performa models, and PowerBook computers.

Monitor Cable Specifications

=====

- 15-pin DSub connector for Macintosh systems

Monitor Signals

=====

Begin_Table

Pin	Output Signal
---	-----
1	Red video ground
2	Red video
3	Not used
4	ID 1
5	Green video
6	Green video ground
7	ID 2
8	Not used
9	Blue video
10	ID 3
11	V Sync return
12	V Sync
13	Blue video ground

14	H Sync return
15	H Sync
Shell	Shield ground

End_Table

Article Change History:

29 Feb 1996 - Clarified voltage requirements.
25 Aug 1995 - Changed "Flat Square CRT" to "shadow mask".
24 Aug 1995 - Corrected resolutions supported on M3935LL/A.

QuickTime VR: Questions and Answers (4/97)

Revised: 5/2/97
Security: Everyone

QuickTime VR: Questions and Answers (4/97)

Article Created: 20 July 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article provides the answers to frequently asked questions about QuickTime VR and its requirements.

DISCUSSION -----

Question: What is Virtual Reality?

Answer: Virtual Reality describes a range of experiences that let you interact with and explore a spatial environment through your computer. These environments are typically computer renderings of simple or complex computer models. Now, with QuickTime VR, these environments can be based on photographic representations of real locations.

Question: What is QuickTime VR?

Answer: QuickTime VR lets you rotate your view of a scene through a complete 360° horizontal circle. Multiple 360 degree views can be linked together to let you travel around in an area. You can move around in space through as many points as the content developer provides. The content provider can also enable certain objects to be virtual as well, letting you view all sides of an object by turning it around using a standard pointing device like a mouse. The combination of scenes and objects provides an experience that is like being there. As you change your view of the scene, correct perspective is maintained, creating the effect of being at the location and looking around. QuickTime VR is the first mainstream technology to enable theses experiences based on real world scenes.

Question: How does QuickTime VR differ from other VR systems?

Answer: QuickTime VR differs in several ways:

- QuickTime VR uses high quality photographic representations of a space for the virtual reality experience, a breakthrough in performance and compression technology. There is no need to model and render an existing space.
- QuickTime VR is a software-only implementation; it is an extension of the QuickTime architecture. It does not require additional hardware.

QuickTime VR's breakthrough is the proprietary software engine that lets you explore real world spaces on most QuickTime capable personal computers. This differs from most virtual reality systems, which require a very fast 3-D computer with specialized hardware that lets the user explore computer generated virtual spaces.

- Easy panoramic image capture; pictures are taken with a standard 35mm camera.

Question: What software comprises QuickTime VR?

Answer: The QuickTime VR software technology includes two components:

- The QuickTime VR Authoring Tools Suite is designed for use by experienced multi-disciplinary photography/multimedia development teams to create exciting new products (typically in the form of CD-ROM titles) such as those previously described. The authoring tools run on Macintosh systems.
- The run-time software provides the environment that users need to experience QuickTime VR on their personal computers. Run-time versions are available for Macintosh and Windows environments.

NOTE: Stand-alone QuickTime VR movies can be played back using Apple's QuickTime VR Player. However, some QuickTime VR movies may be incorporated into other applications, which may require HyperCard or Macromedia Director.

Question: Where can the software be obtained?

Answer: You can obtain the software in several ways:

- The QuickTime runtime software (QuickTime VR Player) is available at Apple's QuickTime VR Web site (<http://qtvr.quicktime.apple.com>).

NOTE: The QuickTime VR Player is not supported by Apple.

- The QuickTime Authoring Tools can be purchased through Apple Programmer's and Developers Association (APDA).

For contact information on APDA, search the Tech Info Library under "APDA".

Question: What are the system requirements for QuickTime VR 1.0 runtime for

Macintosh?

Answer: The system requirements for Macintosh are:

- QuickTime-capable Macintosh
- 68030 25 MHz processor
- QuickTime 2.0
- System 7.1 or later
- 8-bit video
- 8 MB RAM
- A double speed CD-ROM is recommended for CD-based software titles

Question: What are the system requirements for QuickTime VR 1.0 runtime for Windows?

Answer: The system requirements for Windows are:

- 33MHz 386SX computer equipped with Windows 3.1
- QuickTime 2.0 for Windows
- 8-bit video card
- 8 MB RAM
- A double-speed CD-ROM is recommended for CD-based software titles

Question: What are the system requirements for QuickTime VR 1.0 Authoring Tools?

Answer: Here are the requirements for the following systems:

- 68040 33MHz-based Macintosh computer:
 - 40 MB RAM
 - 16-bit video, thousands of colors
 - Double-speed CD-ROM if using images on PhotoCD
 - Approximately 10 MB per panorama, 5 MB per object
 - System 7.1
 - MPW 3.2
 - HyperCard 2.2
 - ResEdit 2.1.1
- PowerPC-based Macintosh computer
 - 40 MB RAM
 - System 7.1.2
 - 16-bit video, thousands of colors
 - Double-speed CD-ROM if using images on PhotoCD
 - Approximately 10 MB per panorama, 5 MB per object
 - ResEdit 2.1.1
 - MPW 3.4b2 (included with QTVR Authoring Tools Suite Version 1.0)

Question: How large are QuickTime VR files? Do I need special equipment to view them?

Answer: QuickTime VR files are exceptionally small, which makes them easy and fast to download without using much computer disk space. In fact, a typical panoramic scene can be as small as 200K. Besides the computer, no additional hardware--such as accelerator boards, helmets, goggles and gloves--is needed to view QuickTime VR scenes.

Question: Where can I download QuickTime VR scenes?

Answer: Try these locations:

- Apple's QuickTime Online: (<http://quicktime.apple.com>)
- QuickTime VR Web site at: (<http://qtvvr.quicktime.apple.com>)

Putting the Reality in Virtual Reality

An Overview of Apple's QuickTime VR Technology

=====

Walking through the corridors of the Louvre, you suddenly find yourself held in the captivating gaze of the Mona Lisa herself... Toes in the shallow tide pool, your daughter picks up a bright orange starfish and turns it every which way there is, to see what it's all about... Strolling down San Francisco's Lombard Street, you become dizzy on what you are surely convinced is the world's most crooked street... Your clients nod in approval after walking down the corridors of their planned office building from the comfort of their own boardroom.

And you do all of this from your personal computer.

Welcome to the new promise of virtual reality. Thanks to an exciting new software technology in development at Apple Computer called QuickTime VR, real-world experiences like these are now possible on an ordinary personal computer. They require no special hardware or accessories, nor any special software.

In this paper we explain the concept of virtual reality for the rest of us, and introduce the innovative new QuickTime VR software technology that makes it possible.

Table of Contents

VII.	The State of the Software and Next Steps

I. QuickTime VR: An Overview

=====

Just what is Virtual Reality?

Virtual Reality describes a range of experiences that enable a person to interact with and explore a spatial environment through a computer. These environments are typically artistic renderings of simple or complex computer models. More often than not, VR applications require specialized hardware or accessories, such as high-end graphics workstations, stereo displays, 3D goggles or gloves. As an alternative to virtual reality, video has been used to view real world spaces.

Apple's QuickTime VR is system software that allows Macintosh and Windows users to experience these kinds of spatial interactions using only a personal computer, with a mouse or trackball, and a keyboard. Furthermore, through an innovative use of 360° panoramic photography, QuickTime VR enables these interactions using real-world representations, as well as computer simulations.

QuickTime VR has two components: a panoramic movie technology that allows users to explore spaces, and an object movie technology that allows users to examine objects close up and interactively.

With QuickTime VR, viewers can explore "real" spaces and objects as if they were there. As users change their view of a scene—turning left or right, looking up or down, or zooming in or out—correct perspective is always maintained, providing the effect of actually looking around. Users can also manipulate objects, looking at them from the front, back, top, bottom, or any other angle of interest.

The three defining characteristics of QuickTime VR are

- 1) it can use real-world images as well as computer-generated images;
- 2) it does not require additional hardware; and
- 3) it is an extension of the QuickTime architecture.

II. What You Can Do with QuickTime VR

=====

QuickTime VR is a technology that Apple is planning to license to third parties in the form of a runtime engine and authoring tools. It enables content developers, production companies and software developers to create exciting new multimedia products, typically in the form of CD-ROM titles, in a wide range of

markets. These opportunities can include:

- Education -- An application that can allow students to explore Mayan ruins, or the habitat of a beaver.
- Engineering -- Airplanes and buildings that have not been built yet can be explored and analyzed.
- Museums -- Tour museums in parts of the world you can't visit in person, and see works not normally on public display.
- Kiosks -- Malls and theme parks can use QuickTime VR to provide interactive, real-world directions to help orient a shopper or visitor.
- Architecture -- QuickTime VR can enable an interactive walk-through of a new house or office building.
- Surrogate Travel -- If you can't go there on a tour, QuickTime VR can bring a tour of Venice to you.
- Games -- Exploration and mystery games can use QuickTime VR to allow people to go through a fun house or visit a crime scene.

III. The Advantages of QuickTime VR

=====

The biggest difference between QuickTime VR and most virtual reality systems is its ability to use high-quality photographic representations of a space, in addition to computer-rendered representations. This, along with other innovations, results in significant advantages for both developers and users of QuickTime VR versus competing multimedia formats.

Advantages for Developers

Easy panoramic image capture Using only a standard 35mm camera and tripod, a real-world 360° scene can be photographed in a few minutes, eliminating the need for expensive panoramic cameras or long video-taping sessions. Because of the increased resolution that film offers over video, the images that QuickTime VR uses will have richer colors and sharper details. Alternatively, computer-generated scenes can be rendered using any off-the-shelf rendering package.

Faster performance QuickTime VR incorporates a revolutionary new compression/decompression algorithm that for the first time delivers the performance necessary to make the photographic-based experience realistic. The performance is independent of the complexity of the scene. And since there are no frame boundaries, QuickTime VR allows for smoother panning as well.

Small file size The capture of a single 360° view of a real scene using video techniques, such as navigable movies, would require tens of megabytes. The QuickTime VR process can store the complete 360° photographic representation in less than one megabyte. The storage required for a computer-rendered scene is even smaller.

Flexible interaction QuickTime VR provides built-in "hot spots" that enable the content developer to make any part of the 360° scene interactive. When the user clicks on a hot spot, a wide variety of actions can be triggered, including the

presentation of a photograph, an audio recording, display text, or another QuickTime VR scene.

Extension to the QuickTime family QuickTime is currently available for Macintosh and Windows personal computers, and is also being developed for consumer electronics devices, such as game players and interactive TV. Because QuickTime VR is part of the QuickTime family of products, it can be delivered on nearly 10 million QuickTime capable machines worldwide, enabling QuickTime VR authors to develop content once and deliver it many times.

In addition, QuickTime VR files can be embedded in hundreds of applications that support QuickTime. A few examples are multimedia authoring tools, presentation packages, word processors, and databases.

Advantages for Users

Realistic simulations Thanks to the use of panoramic photography, scenes built with QuickTime VR enable users to experience 360° real-world simulations. The software provides correct perspective of every view in a scene in real time, giving the user the sense of being there and looking around. Similarly, QuickTime VR maintains correct perspective with complex rendered scenes. QuickTime VR also offers the user the simulated experience of turning an object with their hand.

Intuitive usage Prior to QuickTime VR, video has been used to capture real world spaces, with the limitation that the user must view the scene in the sequence in which the video was recorded. QuickTime VR frees the user to look directly at any view of a scene or an object through a simple, intuitive user interface.

Accessibility In contrast to most virtual reality systems, which require high-end computers or specialized hardware, QuickTime VR runs on most QuickTime-capable Macintosh or Window computers and requires no specialized accessories, making it accessible to a much wider range of users. QuickTime VR requires a system running QuickTime 2.0, which makes the VR files available to any application that uses QuickTime 2.0, and ensures that all VR files may be used with a wide variety of user applications.

IV. Building QuickTime VR Applications

There are three discrete steps in creating a QuickTime VR file: capture, image input, and authoring/composition.

Capture

For real-world representations of scenes, QuickTime VR uses 360 degree panoramic photography. For rendered scene representations, standard, off-the-shelf rendering packages are used.

A 360° panoramic photograph represents the view that one would see by standing in a single spot and turning full circle. Until now, taking such a photograph

required an expensive, special purpose camera. With QuickTime VR authoring tools, that same 360° panoramic view can be captured using a standard 35mm camera to take a series of adjacent photographs. In addition to enabling many more developers to create applications, the use of commercially available 35mm cameras allows for much greater exposure control over the 360° view. The use of standard cameras also permits a wider range of effects due to the large number of existing lenses and filters that may be employed. The actual number of panoramic photographs taken for a particular scene depends on the type of experience the content developer wants to provide the end user. Capturing more panoramic images within a fixed space will yield a smoother navigational experience within that space, but will generate larger storage requirements.

For a 360° rendered view, the panorama may be created directly by the rendering package, or by generating rendered scenes equivalent to the series of photographs used in capturing a real-world panorama.

The representation of virtual objects requires that images of the object be captured from all viewpoints. These images can be rendered or photographic.

Input

Once the photographs have been taken, they are input into a personal computer using a Photo-CD scanner or other standard, commercially available image input devices.

Authoring/Composition

QuickTime VR authoring tools incorporate proprietary software that can automatically stitch together a series of photographs to produce a single, seamless digital panoramic photograph on the Macintosh. Developers can also use an interactive stitching mode, for greater control. The source images can be photographic or computer rendered. Rendering applications that can output panoramic views directly, bypass this step.

Once the panoramic image has been created, it can be post-processed using standard, commercially available painting applications.

With QuickTime VR's pixel-accurate "hot spot" technology, the content developer can enable certain objects within a scene to be interactive. This allows the user to select the object for close up viewing, and view all sides of it by turning it around using a standard pointing device such as a mouse. The combination of scenes and objects simulates to a very high degree the experience of actually being there.

QuickTime VR objects can be used independently of the panoramic scene technology as well.

V. The Run-Time Engine and Software Tools

=====

Apple is planning to license to third-party developers both the QuickTime VR run-time software (for Macintosh and Windows), and authoring tools

(Macintosh-based). The availability and license structures for these tools is anticipated to be disclosed before the end of 1994.

QuickTime VR will support 8-, 16-, and 24-bit video.

VI. Platform Requirements for QuickTime VR

=====

The minimum Macintosh system required for the run-time software is

- QuickTime 2.0,
- System 7.1 or later,
- QuickTime-capable Macintosh with a 68030, 25 MHz processor,
- 8-bit video,
- 5 MB available RAM.

Double-speed CD-ROM is recommended for CD-based software titles.

The minimum Windows system required for the run-time software is

- QuickTime 2.0 for Windows,
- Windows 3.1,
- MPC 2 configuration:
 - . - 80386, 33 MHz processor,
 - . - 8-bit video,
 - . - 8 MB available RAM.

Double-speed CD-ROM is recommended for CD-based software titles.

VII. The State of the Software and Next Steps

=====

In developing the QuickTime VR software, Apple Computer worked closely with Simon & Schuster Publishing to develop an interactive CD-ROM application based on "Star Trek: The Next Generation," released in the Fall of 1994.

As of this writing, QuickTime VR technology is in the final stages of completion. More specific disclosures concerning the availability and opportunities for evaluation and licensing of QuickTime VR are anticipated prior to the end of 1994.

PowerBook Modem & Telecom: Frequently Asked Questions (1/97)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about common PowerBook computer's modem and telecommunication issues.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

DISCUSSION -----

1) Question: I am going to be travelling overseas with my PowerBook computer which has an internal Express Modem. Will I be able to use it to send faxes to friends in the United States?

2) Question: I recently purchased a new external modem, but cannot seem to find an appropriate Apple Remote Access (ARA) script for it. Can I get one from Apple?

3) Question: I have a PowerBook 140/145/170 with the Apple Fax/Data Modem. Can I use any version of the Express Modem software?

4) Question: Where can I find AT commands for my Express Modem?

5) Question: When starting up, my PowerBook computer which has an internal Express Modem displays the Fax Modem extension icon with an "X" through it. I cannot use my modem to send a fax. What is wrong?

6) Question: If I install Apple Telecom 2.x, can I use the Cypress Megaphone software to turn my PowerBook computer into an answering machine and speaker

phone?

7) Question: I have a computer at work running Apple Remote Access (ARA) server software and it has full access to the Internet. I would like to call in from my PowerBook using ARA client and have full access to the Internet as well. Is this possible?

8) Question: I am trying to use Apple Remote Access (ARA) on a single serial port PowerBook (200/2300/500/5300/190 series) computer with an external modem. When I try to connect I get an error saying that the modem could not be detected. How do I get around this?

9) Question: I want to use an external modem with my PowerBook 500 series computer. According to the manual that came with my PowerBook computer, I need to check Normal in my PowerBook Setup control panel. I open the control panel, and the setting is not there. What is wrong?

10) Question: Sometimes I cannot seem to use my internal modem and print at the same time. Why is this?

11) Question: I have a PowerBook 500 series computer with a Global Village PowerPort Mercury modem. Can you tell me how to send and receive faxes?

12) Question: I have a PowerBook 200 series computer with an Apple Express Modem. Can you tell me how to send and receive faxes?

13) Question: I have a PowerBook 500 series computer running System 7.5, with a Global Village PowerPort Mercury modem installed. At startup, I see the message "This Macintosh may not have been shut down properly," followed by the message "Incoming Fax cannot be received because internal modem could not be identified. To identify the modem open up PowerPort control panel hold down Option key and click on PowerPort text." Then the PowerBook locks up. What can I do?

14) Question: My modem (any modem) is dropping the connection after a few minutes. Is there anything I can do to keep this from happening?

15) Question: I am upgrading my PowerBook computer with Express Modem to System 7.5. What version of the Express Modem software should I be using? And what is the latest version of software for the Apple Express Modem?

16) Question: I just upgraded to System 7.5, now I cannot get Apple Remote Access (ARA) to connect. What is going on?

17) Question: Where else can I go for answers?

DISCUSSION -----

1) Question: I am going to be travelling overseas with my PowerBook computer which has an internal Express Modem. Will I be able to use it to send faxes to friends in the United States?

Answer: The PowerBook Express Modem is designed and rated to be used in the United States. There are both technical and legal barriers to operating this

modem overseas. It meets FCC standards, but may not meet requirements to be used in your country of destination.

On the technical side, there are third-party vendors such as TeleAdapt and Global Village who provide solutions to adapting a modem designed for one country to use in another.

As mentioned, there may be legal issues in operating your modem overseas. It is recommended you acquaint yourself with any national, regional, or local laws and conditions on using modems.

2) Question: I recently purchased a new external modem, but cannot seem to find an appropriate Apple Remote Access (ARA) script for it. Can I get one from Apple?

Answer: Some ARA Control Command Language (CCL) scripts come with the AppleTalk Remote Access application, however, if your modem is not in the pop up menu, you need to contact the modem vendor. If you have a third-party modem and do not have the correct script for ARA, contact your modem vendor.

You can also develop your own CCLs with tools from APDA, Apple's source for developer tools.

3) Question: I have a PowerBook 140/145/170 with the Apple Fax/Data Modem. Can I use any version of the Express Modem software?

Answer: You can use any version of the Express Modem software, up to 1.5.5, with your modem. You do, however, need to have the Serial Tool installed in your Extensions folder.

If you already have the older Fax Sender software installed on your system, the Serial Tool will remain on your system after installing the new Express Modem software.

Alternately, you can download the Serial Tool and manually drag it to your Extensions folder. You can download Serial Tool 1.0.2 at the following path:

USA Apple Software Updates -> Macintosh -> Network and Communications -> Communication Toolbox Tools.

4) Question: Where can I find AT commands for my Express Modem?

Answer: When your Express Modem software is installed, it copies a document titled "Express Modem AT Cmds" to your hard drive. This contains AT commands for the Express Modem. If you have installed Apple Telecom 2.0, look for it inside a folder labeled "Telecom Documents". An appendix of the Express Modem manual will also have the AT command set.

5) Question: When starting up, my PowerBook computer which has an internal

Express Modem displays the Fax Modem extension icon with an "X" through it. I cannot use my modem to send a fax. What is wrong?

Answer: Open the Preferences folder inside your System Folder and drag the Fax Preferences file to the Trash, empty the Trash, and restart your PowerBook. The Fax Preferences file can be corrupted due to a system error or screen freeze, disabling the Fax Modem extension as a result.

6) Question: If I install Apple Telecom 2.x, can I use the Cypress Megaphone software to turn my PowerBook computer into an answering machine and speaker phone?

Answer: No, this capability is only available on Power Macintosh, Quadra 660AV, and Quadra 840AV computers using the GeoPort Telecom Adapter.

7) Question: I have a computer at work running Apple Remote Access (ARA) server software and it has full access to the Internet. I would like to call in from my PowerBook using ARA client and have full access to the Internet as well. Is this possible?

Answer: Yes, to do this you will need to install the Apple IP Gateway on the computer running the ARA server software. Then the PowerBook (or any remote Macintosh computer) will have equal access to the Internet when dialing into the ARA server with ARA software.

8) Question: I am trying to use Apple Remote Access (ARA) on a single serial port PowerBook (200/2300/500/5300/190 series) computer with an external modem. When I try to connect I get an error saying that the modem could not be detected. How do I get around this?

Answer: Since ARA requires AppleTalk to be active, the single serial port will, by default, be designated for LocalTalk, not for the external modem. To get around this, open the Network control panel and select Remote Only. This will allow you to have AppleTalk active and use external serial devices, such as an external modem, at the same time. Remember to set the Network control panel back to LocalTalk if you will be using LocalTalk devices or connecting to a LocalTalk network.

9) Question: I want to use an external modem with my PowerBook 500 series computer. According to the manual that came with my PowerBook computer, I need to check Normal in my PowerBook Setup control panel. I open the control panel, and the setting is not there. What is wrong?

Answer: If you do not have an internal modem, this setting will not appear in the PowerBook Setup control panel. If you want to use an external modem with your PowerBook 500 series, simply make certain AppleTalk is inactive in the Chooser and select the modem port in your communications software. You can leave AppleTalk active if you select something other than LocalTalk in the Network control panel.

10) Question: Sometimes I cannot seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook models that have only one serial port (PowerBook 200, 2300, 190, and 5300 series computers), the serial port is mapped as a modem port. Under normal conditions this is not a problem - the internal modem can be used at the same time as a serial device such as a printer is being used. The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to Internal, Compatible, or "Use internal modem instead of modem port". The location of this setting will depend on what version of the modem and system software you have. When the PowerBook is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there is an update.

11) Question: I have a PowerBook 500 series computer with a Global Village PowerPort Mercury modem. Can you tell me how to send and receive faxes?

Answer: Instructions for sending a fax are detailed on pp. 77-89 of your PowerPort 500 Series User's Guide.

Sending a Fax

Sending a fax is a lot like printing. You can follow these instructions to send your first fax:

Step 1

Open whatever document you would like to fax. You can fax from within the application SimpleText, for example.

Step 2

Hold down the Option key on your keyboard, and choose the command Fax from your File menu.

Step 3

The Send Fax Setup dialog box will appear. Here you can enter your Station Name and Station Fax Number. Click OK when you are done.

Step 4

The GlobalFax dialog will appear. Enter the number you wish to call in the Fax field, and enter the recipient's name in the To field. You can also choose a cover sheet at this window.

Step 5

Once you have entered the fax number and name of the recipient, click the Send... button. Your software should image and fax the document.

Receiving a Fax

Instructions for receiving a fax are detailed on pp. 99-105 of your PowerPort 500 Series User's Guide.

You can configure your PowerBook to receive faxes automatically. Of course, it will have to be connected to an analog phone line. To set your PowerBook up to receive faxes automatically, follow these steps:

Step 1

Open the "Global Village Fax Center" under the Apple menu.

Step 2

Under the Fax menu, choose Setup and Receiving.

Step 3

In the Receive Fax Setup dialog box, put an X next to Receive Fax... Click OK when done.

After this, the Global Village Fax Center will answer incoming calls to receive faxes.

12) Question: I have a PowerBook 200 series computer with an internal Apple Express Modem. Can you tell me how to send and receive faxes?

Answer: Instructions for sending a fax are detailed in your Express Fax/Modem User's Guide.

Sending a Fax

Sending a fax is a lot like printing. To send a fax, follow these steps:

Step 1

Open the application from which you wish to send a fax. You can send a fax from the application SimpleText, for example.

Step 2

Press and hold the Control-Shift keys while clicking on the File menu. Select Print... (or Fax...).

Step 3

The Fax Sender dialog will appear. Here you can add names and phone numbers to your address book, select a cover page, or simply type a phone number in the "Fax Quick Send" field.

Step 4

When your setup in Fax Sender is complete, simply click on the Send button. The Fax Sender window will vanish, and your document will be imaged and faxed.

Receiving a Fax

Instructions for receiving a fax are detailed in your "Express Fax/Modem User's Guide".

To enable automatic receiving of faxes, open the application Fax Terminal. In Fax Terminal, choose Preferences... from the Fax menu. In the Preferences... window, click on the "Answer calls to receive faxes" checkbox. You can also set the number of rings before answering here. The Express Modem will now answer incoming calls to receive faxes, even when the Fax Terminal application is not open.

With Express Modem versions 1.5 and later, you can enable fax receiving by checking the "Answer calls" checkbox in the Express Modem control panel.

13) Question: I have a PowerBook 500 series computer running System 7.5, with a Global Village PowerPort Mercury modem installed. At startup, I see the message "This Macintosh may not have been shut down properly," followed by the message "Incoming Fax cannot be received because internal modem could not be identified. To identify the modem open up PowerPort control panel hold down Option key and click on PowerPort text." Then the PowerBook locks up. What can I do?

Answer: This occurs due to a conflict between the shutdown warning message in system software and the version of the Global Village modem software you have installed. Follow these steps to remedy the situation:

Step 1

Allow the computer to start up as normal. You will receive a message saying "This Macintosh may not have been shut down properly." Click "OK". Then you will receive a message that says "Incoming Fax cannot be received because internal modem could not be identified. To identify the modem open up PowerPort control panel hold down Option key and click on PowerPort text.".

Step 2

Perform a Force Quit. Hold down all three of the keys Option-Command (Apple)-Esc and release them all at the same time. A dialog box will appear, either click in the Force Quit button or hit the return key on the keyboard. The computer will finish starting up and the desktop will appear.

Step 3

Open the General Controls control panel and uncheck the Shut Down Warning. Close the General Controls.

Step 4

Restart your computer.

This disables the warning message if the computer is again shut down improperly and will prevent the lock up with the Global Village Mercury Modem software.

If you wish to have the warning message enabled in the system software, you will want to contact Global Village and obtain the latest version of their Powerport Mercury Modem software.

If for some reason the above procedure does not work then you should reinstall the Global Village Modem software. Restart with extensions off, and remove the following items from the System Folder and place them on the desktop:

- * Queue Temp and GlobalFax Preferences files from the GlobalFax Personal folder
- * GlobalFax Files and GlobalFax Personal folders
- * PowerPort 500 control panel

Then reinstall the Global Village software from original disks. Move the GlobalFax addresses from the GlobalFax Personal folder on your desktop into your new GlobalFax Personal folder in your System Folder. You may also want to save the Fax log, the cover sheets and received Faxes in the GlobalFax Files and GlobalFax Personal. The other items that you have dragged out onto your desktop you can throw away.

14) Question: My modem (any modem) is dropping the connection after a few minutes. Is there anything I can do to keep this from happening?

Answer: If the modem is disconnecting unexpectedly, a standard fix is to turn off error correction and data compression. You can do this by using the initialization string AT&F%CO\NO. Note that this might make the modem a little slower because of the lack of data compression, but it will make the connection more stable.

15) Question: I am upgrading my PowerBook computer with Express Modem to System 7.5. What version of the Express Modem software should I be using? And what is the latest version of software for the Apple Express Modem?

Answer: You should upgrade your Express Modem software to at least version 1.5.3. Earlier versions may not work properly with System 7.5. To find out what the current version of Apple Telecom is, look in the Tech Info Library for the article "Apple Software: Current Versions". The latest version of the Express Modem software is available on the following services:

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

16) Question: I just upgraded to System 7.5, now I cannot get Apple Remote Access (ARA) to connect. What is going on?

Answer: System 7.5 requires version 2.0 or later of ARA. Earlier versions will not connect or will not work properly. You can upgrade to the latest version by calling the Apple Order Center.

The Tech Info Library article titled "Locating Vendor Information" can help you

search for the Apple Order Center's phone number.

17) Question: Where else can I go for answers?

Answer: If you have not done so already, check the other PowerBook-related FAQ documents in Apple's Technical Information Library (TIL). This library is available on the Internet at <http://til.info.apple.com/> and contains thousands of technical articles.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Apple StyleWriter Printers: Frequently Asked Questions (7/96)

Revised: 7/3/96
Security: Everyone

Apple StyleWriter Printers: Frequently Asked Questions (7/96)

=====

Article Created: 20 July 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Apple StyleWriter printers, including the portable and color models.

Questions in this FAQ:
=====

- How do I share a StyleWriter on a network?
- When I print anything on my StyleWriter II, there are thin white lines through all the letters. What is causing this?
- Is it OK to use ink cartridge refill kits with my StyleWriter family printer?
- I have a Color StyleWriter Pro and when I print, I get -39 errors. What is causing this?
- I have a Color StyleWriter Pro connected to my Power Macintosh. When I try to print anything, it starts to print the configuration page and freezes halfway through the process. What is causing this?
- I have a PowerBook 500 series computer and a StyleWriter Printer. When I try to print, I get messages telling me to check my connections. My connections appear to be sound. What is causing this?
- When I print to my StyleWriter, I get a message saying there is no paper in the printer. If I then click OK, I get a message saying the paper in the printer is the wrong size. What is causing this?
- When I try to install the software for my StyleWriter, I get a message saying that System 7 or greater is needed and I already have System 7 installed.

DISCUSSION -----

Question:

How do I share a StyleWriter on a network?

Answer:

The StyleWriter family of printers (except for the Portable StyleWriter) can be shared via Apple's grayshare technology as long as the computer to which their printer is directly attached has at least a 68020 processor.

They cannot be connected directly to a network with LocalTalk cables (The Color StyleWriter 2400 can be directly connected to a LocalTalk network if you purchase and attach the LocalTalk module for the printer) If you do not have this module, or have any other shareable StyleWriter, you can share the printer by following the instructions below.

NOTE - with the original StyleWriter, you must use the StyleWriter II driver to share the printer). Instructions for sharing the printer appear below.

Sharing a Printer

To share a StyleWriter printer with others, follow these steps:

Step 1

In order to share a printer, you must be connected to an AppleTalk network of some type.

LocalTalk Connection

The LocalTalk connector goes into the printer port. The peripheral-8 cable (serial cable) connects the printer to the Macintosh. It needs to go into the modem port.

Ethernet or Token Ring Connection

Since both Ethernet and Token Ring connections don't require you to use a serial port on your Macintosh, you can use either the printer or modem port to connect the printer to your Macintosh.

Step 2

Open the Chooser and select the appropriate printer icon.

Step 3

Click the icon of the port to which your printer is connected. If you are using the printer port to connect your Macintosh to the network, you must connect your printer to the modem port.

Step 4

Click the Setup button to open the Sharing Setup dialog box.

Step 5

Place an X in the "Share this Printer" checkbox. You have the option of naming

your printer and entering a password. If you type a password for the printer, only users who know the password can use the printer from their computers.

If you want a record of what is printed on your printer, place an X in the "Keep Log of Printer Usage" checkbox.

Step 6

Click "OK" to close the StyleWriter II Sharing Setup dialog box and close the Chooser window.

Your printer is now available to others on the network.

Printing to a Shared Printer

To print to a shared printer, follow these steps:

Step 1

Open the Chooser and select the appropriate printer icon. A list of available printers and communications ports will be displayed.

Step 2

Click the name of the shared printer that you want to use. If the printer requires a password, a dialog box appears in which you must type the password.

Step 3

Close the Chooser

You are now ready to print to the shared printer.

Question:

When I print anything on my StyleWriter II, there are thin white lines through all the letters. What is causing this?

Answer:

This can be caused by a number of things:

1) The cartridge may be running low on ink. The cartridge can print about 300 pages at 5% coverage (100 pages of double-spaced text in 12 point type). If you are nearing the end of the cartridge's life, try replacing it.

2) Make sure you are using an Apple or Canon ink cartridge and make sure the cartridge has not been refilled.

3) The ink jets may be clogged or have air bubbles in them. This can occur even with new ink cartridges. Try cleaning the ink cartridge as follows:

Remove the ink cartridge and cover the area at the bottom of the cartridge (you will see a silver strip) with a wet paper towel. Then shake the cartridge vigorously as if you were shaking down a thermometer. This should force some ink out of the jets and may eliminate the lines

4) Open up the front of the printer and move the ink cartridge assembly to the

left. Underneath where the ink cartridge was, you will see a clear plastic wiper blade and a small rectangular area with spongy material. If any lint has accumulated in this area, use your finger to wipe it off.

If you leave paper in the printer for a long time without printing, lint can build up on the paper and get inside the printer, causing the white lines.

5) You may have a defective ink cartridge. Try replacing it with a new one.

Question:

Is it OK to use ink cartridge refill kits with my StyleWriter family printer?

Answer:

Apple StyleWriter Ink Cartridges are made by Canon for Apple and meet Apple's rigid specifications.

Physical damage to the printer caused by the use of a third-party printhead cartridge or ink refill kits that DO NOT meet Apple's rigid standards WILL void the warranty.

Apple recommends the use of only Apple or compatible Canon ink cartridges with its StyleWriter printers.

Question:

I have a Color StyleWriter Pro and when I print, I get -39 errors. What is causing this?

Answer:

This will occur with the Color StyleWriter Pro driver v1.5 if you have more than 32 MB of available RAM. It is documented in the Color StyleWriter Pro v1.5 ReadMe document. To correct this, use the Color StyleWriter Pro driver v1.5.2.

This update can be obtained online from various locations where Apple posts its software. For a list of these locations, search Apple's Tech Info Library using the shortcut "software updates and online" to find the article "Where To Find Apple Software Updates"

Question:

I have a Color StyleWriter Pro connected to my Power Macintosh. When I try to print anything, it starts to print the configuration page and freezes halfway through the process. What is causing this?

Answer:

This can occur with the Color StyleWriter Pro driver v1.5 and Power Macintosh computers. To correct this , use the Color StyleWriter Pro driver v1.5.2.

This update can be obtained online from various locations where Apple posts its software. For a list of these locations, search Apple's Tech Info Library using the shortcut "software updates and online" to find the article "Where To Find Apple Software Updates"

Question:

I have a PowerBook 500 series computer and a StyleWriter Printer. When I try to print, I get messages telling me to check my connections. My connections appear to be sound. What is causing this?

Answer:

The PowerBook 520c and 540c computers employ a single serial port which is a combination Printer/Modem port. In order to use this port for serial printing, use the following information to properly configure your PowerBook 500 series computer:

Step 1

If the Express Modem is installed:

- Open the Express Modem control panel and select Use External Modem.
- Open the PowerBook Setup control panel and select Normal.

Step 2

Open the Chooser and do the following:

- If using the PowerBook 200 series, turn OFF AppleTalk. If using the PowerBook 500 series, you do not have to disable AppleTalk. If you are using Ethernet; you MUST verify that the Network Control Panel is set for Ethernet.
- Select the serial printer driver.
- Select the "printer/modem" icon (or the modem icon if the printer/modem icon is not available).

Note: Domestic PowerBook 500 series computers will have a Global Village Powerport Mercury modem installed, not an Express modem, and therefore will only need to have the PowerBook Setup control panel set to normal for step #1.

A similar situation can also occur when using the Color StyleWriter 2400 or other serial printer. If you see no port selection choices, make sure the PowerBook Setup control panel is set for Normal.

Step 3

Disable the Assistant Toolbox extension with the Extensions Manager control panel, if it is enabled.

Question:

When I print to my StyleWriter, I get a message saying there is no paper in the printer. If I then click OK, I get a message saying the paper in the printer is the wrong size. What is causing this?

Answer:

This symptom had two major causes:

- 1) You are using the wrong type of cable, have a loose cable connection, or have a defective cable. You must use a Macintosh Peripheral-8 cable to connect the StyleWriter series of printer to your Macintosh Computer. You cannot use LocalTalk cables (the only exception is when you have a Color StyleWriter 2400

with the LocalTalk module installed).

You should also disconnect the cable and reconnect it to be sure it is plugged in securely.

2) You have the printer set up incorrectly in the Chooser. Go to the Chooser and select the printer icon for your printer from the list on the left. Note that the StyleWriter II uses the "StyleWriter II" driver, not the one named simply "Stylewriter."

After selecting the correct icon, you should see a box on the right labelled "Connect To:" with the icons of the printer port and the modem port. Click on the icon that corresponds to the icon above the port to which the printer is physically attached.

Question:

When I try to install the software for my StyleWriter, I get a message saying that System 7 or greater is needed and I already have system 7 installed.

Answer:

This message usually occurs when you are trying to install the printer software on a computer on which the driver is already installed.

Check the Chooser to make sure the driver is not already there. If it is not, you can install the printer software as follows:

Step 1

Insert the printer installation disk and double click the Installer

Step 2

When the Welcome to the Installer screen appears, click OK

Step 3

When the Install screen appears, select Customize or Custom Install

Step 4

Choose the individual portions of software you want to install. If you have System 7.5, elect to install software for system 7.1.

Step 5

Click Install

This will allow you to install the software.

Question:

When I print to my StyleWriter, I get a message telling me to check my connections and print again. The connections appear to be secure. What is causing this?

Answer:

First, make sure you are using the correct type of cable. You must use a Macintosh Peripheral-8 cable to connect the StyleWriter series of printer to

your Macintosh Computer. You cannot use LocalTalk cables (the only exception is when you have a Color StyleWriter 2400 with the LocalTalk module installed).

If you are using the correct cable and have checked to make sure it is plugged in securely, you should next check to see that the printer is set up correctly in the Chooser.

Go to the Apple Menu and select Chooser, then select the printer icon for your printer from the list on the left. Note that the StyleWriter II uses the "StyleWriter II" driver, not the one named simply "Stylewriter."

After selecting the correct icon, you should see a box on the right labelled "Connect To:" with the icons of the printer port and the modem port. Click on the icon that corresponds to the icon above the port to which the printer is physically attached. You may have to turn the computer around so that you can see to which port the printer is connected.

If you have the printer connected to the printer port, make sure that AppleTalk is set to "Inactive"

The printer should now be set up correctly for printing.

FTP Software's PC/TCP: Which Works With DOS Compatible (9/95)

Article Created: 21 July 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

What version of FTP Software's PC/TCP IP suite works with the Power Macintosh 6100 DOS Compatible computer?

DISCUSSION -----

The version of FTP Software's PC/TCP IP suite that works with the Power Macintosh 6100 DOS Compatible computer is OnNet v1.2. This version has been tested with the Power Macintosh 6100 DOS Compatible computer. Manual editing of the net.cfg file must be done after installing the software.

Add the following lines to the net.cfg file:

```
Link Support
Max stacks 8
```

Add the following lines to the end of the Link Driver MACODI section of the net.cfg file:

```
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II
```

NOTE: The software allows installation of either DOS TSRs or vxd files. In testing, only the vxd files were loaded. See the product documentation for further information.

Also, see the Tech Info Library article titled, "Pwr Mac DOS Compatibility Card: PC/TCP Does Not Function (7/95)", for a discussion of using earlier versions of FTP Software's PC/TCP packages with the Power Macintosh 6100 DOS Compatible computer.

MAE 2.0: 16 Bit Sound Not Supported (7/95)

Revised: 7/21/95
Security: Everyone

MAE 2.0: 16 Bit Sound Not Supported (7/95)

=====

Article Created: 21 July 1995

TOPIC -----

I am unable to get 16 bit sound on my SPARCstation 5 with 16 bit sound support, Solaris 2.4, and MAE 2.0. My system supports 16 bit sound, as other UNIX applications can play 16 bit sounds on my internal speaker.

The Sound control panel appears to load properly, and the sound out option is available. However, the 16 bit and Stereo option is grayed out.

Do you have any recommendations to resolve this? Also, is it possible to modify any of the UNIX files to allow MAE to properly recognize the sound capabilities of my workstation?

DISCUSSION -----

We tested with our SPARCstation 5 workstation's built-in speaker, and 16 bit sound does not seem to be compatible with MAE 2.0. The Sound control panel is grayed out.

According to Engineering, although Apple did not state MAE 2.0 supports 8 bit or 16 bit sound in our documentation, they did confirm that only 8 bit sound is supported. There is no 16 bit sound support under MAE 2.0.

DHCP: Frequently Asked Questions (2/97)

Article Created: 21 July 1995
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article covers frequently asked questions (FAQ) about Dynamic Host Configuration Protocol (DHCP).

General

- 1) What is DHCP?
- 2) What is DHCP's purpose?
- 3) How is it different that BOOTP or RARP?
- 4) Why shouldn't clients assign IP numbers without the use of a server?
- 5) Can DHCP support statically defined addresses?
- 6) Can a BOOTP client boot from a DHCP server?
- 7) Can a DHCP client boot from a BOOTP server?
- 8) Can a DHCP client update its DNS entry through DHCP?
- 9) When will the server to server protocol be defined?
- 10) Is there a DHCP mailing list?
- 11) In a subnetted environment, how does the DHCP server discover what subnet a request has come from?
- 12) Where is DHCP defined?
- 13) Can a client have a home address and still float?
- 14) How can I relay DHCP if my router does not support it?
- 15) How do I migrate my site from BOOTP to DHCP?
- 16) Can you limit which MAC addresses are allowed to roam?
- 17) Can DHCP support remote access?
- 18) What are the Gotcha's?

Info on Implementations

- 19) What freeware DHCP servers are available?
- 20) What commercial DHCP servers are available?
- 21) Which vendors of client software currently support DHCP?
- 22) What are the DHCP plans of major client-software vendors?

- 23) What Routers forward DHCP requests?
- 24) What Routers include DHCP servers?
- 25) What Routers use DHCP to configure their IP addresses?
- 26) What Servers forward DHCP requests?
- 27) Which implementations support or require the broadcast flag?
- 28) How can I run Windows 95 without a DHCP server?
- 29) Do any servers limit the MAC addresses that may roam?
- 30) What analyzers decode DHCP?
- 31) What administration tools administer DHCP configurations?
- 32) What are the Gotcha's specific to various implementations?
- 33) How do I get a DHCP Client using Open Transport to release or renew a DHCP lease before the lease has expired?

DISCUSSION -----

Author: John Wobus, jmwobus@syr.edu

Date: 7/5/1995

This file: [<http://web.syr.edu/~jmwobus/comfaqs/dhcp.faq.html>](http://web.syr.edu/~jmwobus/comfaqs/dhcp.faq.html)

General

1) Question: What is DHCP?

Answer: DHCP stands for "Dynamic Host Configuration Protocol".

2) Question: What is DHCP's purpose?

Answer: DHCP's purpose is to enable individual computers on an IP network to extract their configurations from a server (the 'DHCP server') or servers, in particular, servers that have no exact information about the individual computers until they request the information. The overall purpose of this is to reduce the work necessary to administer a large IP network.

3) Question: How is it different that BOOTP or RARP?

Answer: DHCP is based on BOOTP and maintains some backward compatibility. The main difference is that BOOTP was designed for manual pre-configuration of the host information in a server database, while DHCP allows for dynamic allocation of network addresses and configurations to newly attached hosts. Additionally, DHCP allows for recovery and reallocation of network addresses through a leasing mechanism.

RARP is a protocol used by Sun and other vendors that allows a computer to find

out its own IP number, which is one of the protocol parameters typically passed to the client system by DHCP or BOOTP. RARP doesn't support other parameters and using it, a server can only serve a single LAN. DHCP and BOOTP are designed so they can be routed.

4) Question: Why shouldn't clients assign IP numbers without the use of a server?

Answer: It is theoretically possible for client-machines to find addresses to use by picking an address out of the blue and broadcasting a request of all the other client machines to see if they are using them. AppleTalk is designed around this idea, and Apple's MacTCP can be configured to do this for IP. However, this method of IP address assignment has disadvantages.

- A computer that needs a permanently assigned IP number might be turned off and lose its number to a machine coming up. This has problems both for finding services and for security.
- A network might be temporarily divided into two non-communicating networks while a network component is not functioning. During this time, two different client-machines might end up claiming the same IP number. When the network comes back, they start malfunctioning.
- If such dynamic assignment is to be confined to ranges of IP addresses, then the ranges are configured in each desktop machine rather than being centrally administered. This can lead both to hidden configuration errors and to difficulty in changing the range. Another problem with the use of such ranges is keeping it easy to move a computer from one subnet to another.

5) Question: Can DHCP support statically defined addresses?

Answer: Yes. At least there is nothing in the protocol to preclude this and one expects it to be a feature of any DHCP server. This is really a server matter and the client should work either way.

6) Question: Can a BOOTP client boot from a DHCP server?

Answer: A DHCP server can be written this way. Since DHCP was developed after BOOTP, it would be logical for most server developers to support this.

7) Question: Can a DHCP client boot from a BOOTP server?

Answer: A DHCP client can be written this way, i.e. to treat a BOOTP reply as an unending lease on the IP address.

8) Question: Can a DHCP client update its DNS entry through DHCP?

Answer: There are options in DHCP through which a DHCP client can request that its DNS entry be updated. DHCP clients will be able to take advantage of planned

enhancements to the DNS protocol that will allow dynamic updates through the network.

9) Question: When will the server to server protocol be defined?

Answer: The DHC WG of the IETF is actively investigating the issues in inter-server communication. The protocol should be defined "soon".

10) Question: Is there a DHCP mailing list?

Answer: There are several:

Begin_Table

List	Purpose
----	-----
host-conf@sol.eg.bucknell.edu	General discussion
dhcp-bake@bucknell.edu	DHCP bakeoffs
dhcp-impl@bucknell.edu	Implementations
dhcp-serve@bucknell.edu	Server to server protocol

Admin requests for the host-conf list should go to host-conf-request@sol.eg.bucknell.edu; admin requests for the other lists should go to listserv@bucknell.edu.

End_Table

11) Question: In a subnetted environment, how does the DHCP server discover what subnet a request has come from?

Answer: DHCP client messages are sent to off-net servers by DHCP relay agents, which are often a part of an IP router. The DHCP relay agent records the subnet from which the message was received in the DHCP message header for use by the DHCP server.

12) Question: Where is DHCP defined?

Answer: In Internet RFCs.

RFC1541 - R. Droms, "Dynamic Host Configuration Protocol", 10/27/1993.

RFC1533 - R. Droms, "Interoperation Between DHCP and BOOTP", 10/08/1993.

RFC1532 - S. Alexander, R. Droms, "DHCP Options and BOOTP Vendor Extensions", 10/08/1993.

13) Question: Can a client have a home address and still float?

..TIL18237-DHCP-Frequently_Asked_Questions_2-97.pdf

Answer: There is nothing in the protocol to keep a client that already has a leased or permanent IP number from getting a(nother) lease on a temporary basis on another subnet (i.e., for that laptop which is almost always in one office, but occasionally is plugged in in a conference room or class room). Thus it is left to the server implementation to support such a feature. I've heard that Microsoft's NT-based server can do it.

14) Question: How can I relay DHCP if my router does not support it?

Answer: A server on a net(subnet) can relay DHCP or BOOTP for that net. Windows NT can be set up that way.

15) Question: How do I migrate my site from BOOTP to DHCP?

Answer: I don't have an answer for this, but will offer a little discussion. The answer depends a lot on what BOOTP server you are using and how you are maintaining it. If you depend heavily on BOOTP server software to support your existing clients, then the demand to support clients that support DHCP but not BOOTP presents you with problems. In general, you are faced with the choice:

1. Find a server that is administered like your BOOTP server only that also serves DHCP. For example, one popular BOOTP server, the CMU server, has been patched so that it will answer DHCP queries.
2. Run both a DHCP and a BOOTP server. It would be good if I could find out the gotcha's of such a setup.
3. Adapt your site's administration to one of the available DHCP/BOOTP servers.
4. Handle the non-BOOTP clients specially, e.g. turn off DHCP and configure them statically: not a good solution, but certainly one that can be done to handle the first few non-BOOTP clients at your site.

16) Question: Can you limit which MAC addresses are allowed to roam?

Answer: Sites may choose to require central pre-configuration for all computers that will be able to acquire a dynamic address. A DHCP server could be designed to implement such a requirement, presumably as an option to the server administrator. See section below on servers that implement this.

17) Question: Can DHCP support remote access?

Answer: PPP has its own non-DHCP way in which communications servers can hand clients an IP address called IPCP (IP Control Protocol) but doesn't have the same flexibility as DHCP or BOOTP in handing out other parameters. Such a communications server may support the use of DHCP to acquire the IP addresses it gives out. This is sometimes called doing DHCP by proxy for the client. I know that Windows NT's remote access support does this.

A feature of DHCP under development (DHCPinfrom) is a method by which a DHCP server can supply parameters to a client that already has an IP number. With this, a PPP client could get its IP number using IPCP, then get the rest of its parameters using this feature of DHCP.

SLIP has no standard way in which a server can hand a client an IP address, but many communications servers support non-standard ways of doing this that can be utilized by scripts, etc. Thus, like communications servers supporting PPP, such communications servers could also support the use of DHCP to acquire the IP addressees to give out.

I am not currently aware of any way in which DHCP can support client-computers served solely by PPP or SLIP. Such a computer doesn't have the IEEE-style MAC address that DHCP requires to act as its key to determining which client-computer is which within the same subnet. Communications servers that acquire IP numbers for their clients via DHCP run into the same roadblock in that they have just one MAC address, but need to acquire more than one IP address. One way such a communications server can get around this problem is through the use of a set of unique pseudo-MAC addresses for the purposes of its communications with the DHCP server. Another way (used by Shiva) is to use a different "client ID type" for your hardware address. Client ID type 1 means you're using MAC addresses. However, client ID type 0 means an ASCII string.

18) Question: What are the Gotcha's?

Answer:

1. A malicious user could make trouble by putting up an unofficial DHCP server.
 - The immediate problem would be a server passing out numbers already belonging to some computer yielding the potential for two or more "innocent bystander" nodes ending up with the same IP number. Net result is problems using the nodes, possibly intermittent of one or the other is sometimes turned off.
 - A lot of problems are possible if a renegade server manages to get a client to accept its lease offering, and feeds the client its own version of other booting parameters. One scenario is a client that loads its OS over the network via tftp being directed to a different file (possibly on a different server), thus allowing the perpetrator to take over the client. Given that boot parameters are often made to control many different things about the computers' operation and communication, many other scenarios are just as serious.
Note that BOOTP has the same vulnerabilities.
2. The "broadcast flag": DHCP includes a way in which client implementations unable to receive a packet with a specific IP address can ask the server or relay agent to use the broadcast IP address in the replies (a "flag" set by the client in the requests). The definition of DHCP states that implementations "should" honor this flag, but it doesn't say they "must". Some Microsoft TCP/IP implementations used this flag, which meant in practical terms, relay agents and servers had to implement it. A number of BOOTP-relay-agent implementations (e.g. in routers) handled DHCP just fine except for the need for this feature, thus they announced new versions stated to

handle DHCP.

3. Some of the virtual LAN schemes, i.e., those that use the packet's IP number to decide which "virtual LAN" a client-computer is on for the purposes of TCP/IP, don't work when using DHCP to dynamically assign addresses. DHCP servers and relay agents use their knowledge of what LAN the client-station is on to select the subnet number for the client-station's new IP address whereas such switches use the subnet number sent by the client-station to decide which (virtual) LAN to put the station on.
4. Routers are sometimes configured so that one LAN on one port has multiple network (or subnet) numbers. When the router is relaying requests from such a LAN to the DHCP server, it must pass along as IP number that is associated with one of the network (or subnet) numbers. The only way the DHCP server can allocate addresses on one of the LAN's other network (or subnet) numbers is if the DHCP server is specifically written to have a feature to handle such cases, and it has a configuration describing the situation.
5. The knowledge that a particular IP number is associated with a particular node is often used for various functions. Examples are: for security purposes, for network management, and even for identifying resources. Furthermore, if the DNS's names are going to identify IP numbers, the numbers, the IP numbers have to be stable. Dynamic configuration of the IP numbers undercuts such methods. For this reason, some sites try to keep the continued use of dynamically allocatable IP numbers to a minimum.
6. With two or more servers serving a LAN, clients that are moved around (e.g. mobile clients) can end up with redundant leases. Consider a home site with two DHCP servers, a remote site with DHCP services, and a mobile client. The client first connects to the home site and receives an address from one of the two serves. He/she then travels to the remote site (without releasing the lease at the home site) and attempts to use the acquired address. It is of course NAK'ed and the client receives an address appropriate for the remote site. The client then returns home and tries to use the address from the remote site. It is NAK'ed but now the client broadcasts a DHCPDISCOVER to get a address. The server that holds the previous lease will offer the address back to the client but there is no guarantee that the client will accept that address; consequently, it is possible for the client to acquire an address on the other server and therefore have two leases within the site. The problem can be solved by using only one server per subnet/site and can be mitigated by short lease lengths. But in a very mobile environment, it is possible for these transient servers to consume more than their fair share of addresses.
7. If departments, offices, or individuals run DHCP servers with their own small address pools on LANs shared by other departments, offices, or individuals, they can find that their addresses are being used by anyone on the LAN that happens to set their IP configuration to use DHCP.

Info on Implementations

..TIL18237-DHCP-Frequently_Asked_Questions_2-97.pdf

19) Question What freeware DHCP servers are available?

Answer: This is not necessarily a complete list.

950415 Bootp server:

Bootp 2.4.3 (not DHCP, but with the "DHCP patches" mentioned below,
can handle DHCP requests)

<ftp://ftp.mc.com/pub/bootp-2.4.3.tar.Z>

950425 Patched bootp server:

Bootp server version 2.4.3 with DHCP patches (does static allocation
of IP addresses)

http://www.sghms.ac.uk/~mpreston/bootp_dhcp.tar.Z

(within <http://www.sghms.ac.uk/~mpreston/tools.htm>)

950630 WIDE Project:

Akihiro Tominaga (tomy@sfc.wide.ad.jp)

WIDE Project

Keio Univ.

Japan

<ftp://sh.wide.ad.jp/WIDE/free-ware/dhcp/dhcp-1.2.1.tar.gz>

Check Archie for dhcp-1.2.1 because lots of sites distribute it.

20) Question: What commercial DHCP servers are available?

Answer: This is not necessarily a complete list.

Windows NT has one.

950407 FTP Software (Services OnNet Product)

950411 Sun (SolarNet)

950425 Microsoft

950425 Competitive Automation

950425 Silicon Graphics

950525 Process Software: server for OpenVMS

950613 NetWare/IP 2.1 will NOT support DHCP but support for enhanced
bootp will be provided. I'm guessing this means DHCP-format
packets, but no address leasing.

21) Question: Which vendors of client software currently support DHCP?

Answer: This is not necessarily a complete list.

950417 Shiva: proxy client for remote users (in Lanrovers and Netmodems)

950417 FTP Software: for DOS and Windows (included in PC/TCP OnNet and
PC/TCP networking software)

950419 Beame and Whiteside: NFS client

950419 Dirk Koeppen EDV-Beratungs-GmbH: TCP/IP DHCP Boot ROMs (TCP/IP
BOOT-PROM)

950421 Microsoft: Windows for Workgroups

950425 Sun

..TIL18237-DHCP-Frequently_Asked_Questions_2-97.pdf

950425 Competitive Automation
950425 Silicon Graphics
950425 Hewlett-Packard
950502 NetManage: Chameleon 4.5
950630 Beame & Whiteside Software: resells Dirk Koeppen
EDV-Beratungs-GmbH's TCP/IP BOOT-PROM
950705 Microsoft: MS-TCP/IP 3.11a & MS-TCP/IP 3.11b

22) Question: What are the DHCP plans of major client-software vendors?

Answer:

MacTCP: will support it; I have no news on when or what version.

Windows95: will support it and will not support BOOTP!

Novell: has plans for client support later in 1995

IBM AIX: will support it; I have no news on when or what version.

OS/2: will support it; I have no news on when or what version.

23) Question: What Routers forward DHCP requests?

Answer: This is not necessarily a complete list.

Cisco: (from Cisco FAQ) Routers running GSYS version 9.21(4) and 10.0(3) as well as later releases.

Wellfleet/Bay: (from Wellfleet FAQ) DHCP is supported by enabling BOOTP support (with transmission and/or reception as needed).

3Com Netbuilder: Version 7.2 software can support DHCP relaying through the use of its generic UDP Helper service. Version 8.0 and later officially supports DHCP.

Xyplex: Word is that release 5.1 slated for first quarter 1996 will support it.

24) Question: What Routers include DHCP servers?

DHCP requires disk storage (or some other form of reliable non-volatile storage), making the task of DHCP service compatible with servers but incompatible with dedicated routers. There are a number of server types that can be configured to both route and serve DHCP (especially all-in-one "Internet Gateways" designed to be web servers, firewalls, etc.), but no dedicated routers.

25) Question: What Routers use DHCP to configure their IP addresses?

Answer: The DHCP RFC specifically says that DHCP is not intended for use in

configuring routers. The reason is that in maintaining and troubleshooting routers, it is important to know its exact configuration rather than leaving that to be automatically done, and also that you do not want your router's operation to depend upon the working of yet another server.

It may be possible to configure some types of more general-purpose computers or servers to get their addresses from DHCP and to act as routers. Also, there are remote access servers, often which are usually not true routers, which use DHCP to acquire addresses to hand out to their clients.

26) Question: What Servers forward DHCP requests?

Answers: Windows NT's 3.51 Service Pack 3 (and 4) includes a BOOTP (& DHCP) relay agent as part of "Multi Protocol Router". 3.51). For Novell servers, there are NLMs that forward BOOTP requests, thus DHCP requests.

The "BOOTPFWD NLM" is included in NetWare 4.1. You can get this support in NetWare 3.11 and 3.12 also, but you must apply the TCP31A.EXE patch which is located on Netware. Here are two such NLMs that are available online:

<ftp://netlab2.usu.edu/misc/bootpfd.zip>(unsupported Novell software,1993)
<ftp://netlab2.usu.edu/misc/bootp311.zip>(unsupported Novell software,1991)

Also for Novell servers, the DHCP server that comes with NetWare/IP 2.2 can be configured to be just a BOOTP/DHCP forwarding agent.

27) Question: Which implementations support or require the broadcast flag?

Answer: The broadcast flag is an optional element of DHCP, but a client which sets it works only with a server or relay that supports it.

Clients

- Microsoft Windows NT -DHCP client support added with version 3.5 sets the broadcast flag. Version 3.51 and later no longer set it. The exception is in the remote access support: it sets the flag when it uses DHCP to acquire addresses to hand out to its PPP clients.
- tcp/ip-32 for Microsoft Windows for Workgroups (WFW)- Version 3.11a sets it, but version 3.11B doesn't.
- Microsoft Windows 95 - Does not set the broadcast flag.

28) Question: How can I run Windows 95 without a DHCP server?

Answer: Not really a DHCP question, but it has been asked a lot, particularly by sites for which changing from BOOTP represents a lot of work. Some choices:

1. Use no server at all for the Windows 95 clients: set the addresses in each client's setup.
2. Install a non-Microsoft TCP/IP stack for Windows 95 that supports BOOTP.

3. Switch from your current BOOTP server to one that supports both BOOTP and DHCP.
4. I know nothing about it, but there exists code to make Windows 95 run BOOTP:
<ftp://ftp.stanford.edu/pub/mailling-lists/win95netbugs/billgpc.zip>

A Document that addresses this question is the Windows 95tm Networking FAQ, <<http://www-leland.stanford.edu/~llurch/win95netbugs/faq.html>>

29) Question: Do any servers limit the MAC addresses that may roam?

Answer: IBM's AIX and OS/2 WARP DHCP servers.

30) Question: What analyzers decode DHCP?

Answer: Release 5.0 of Network General Corporation's Sniffer software. I believe one of the free Unix implementations has included in its distribution a program that captures and decodes BOOTP and DHCP negotiations. Microsoft's SMS includes a protocol analyzer called "Network Monitor" that decodes DHCP. All NT software includes a remote agent for it.

31) Question: What administration tools administer DHCP configurations?

Answer: Quadritek's QIP network administration product includes an interface to Competative Automation's JOIN DHCP server.

32) Question: What are the Gotcha's specific to various implementations?

Answer: In many cases, new releases have solved the problems that have been identified with various DHCP implementations.

1. There have been servers that are inflexible as to the list of configuration parameters they were able to serve. If your client requires certain parameters, you could find such a server unusable.
2. I hate to cast wide suspicions, but I've heard occasional word on client DHCP implementations that do not implement the entire protocol. Doing so requires that the software module be able to wake up again after a specified period of time and "renew the lease", i.e., ask to continue using the IP number. This is at least one feature of DHCP that is very hard to implement in some simpler systems.
3. There are a number of issues regarding the patched bootp servers. These have been reported to re DD2.4.3:
 - 'When run from inetd, I had problems with "Could not bind port" and DHCP request failure. I don't know why, and the problem went away when bootpd is run as a daemon.'
 - 'Unless you set "dl" to some value in the bootptab file, the DHCP lease time, renewal time and prebinding time will be rubbish, which will cause occasional renewal problems.' One symptom you might see is Microsoft DHCP implementations using 5-minute leases, which is their default. Other

implementations may not run at all.

4. Early Microsoft DHCP client implementations required the broadcast bit. Current ones do not.
5. I have heard a vague complaints about the Microsoft implementations of DHCP: that it does not follow the standards. I could use details.
6. Early Apple Open Transport implementations did not always fill out packets to BOOTP's 300-byte minimum, thus BOOTP forwarding agents that follow the BOOTP RFC and discard such packets end up discarding such DHCP packets, causing some of the functions to fail. Open Transport 1.1 fixes this.
7. The very first announced release of Carnegie Mellon's server, dhcp-3.3.6, circa March 1996 has shown signs of needing to be shaken out to be more easily compiled outside of its development environment.

33) Question: How do I get a DHCP Client using Open Transport to release or renew a DHCP lease before the lease has expired?

Answer: Open Transport clients release their DHCP address lease whenever the TCP/IP stack becomes inactive. This can be accomplished by:

- Restarting the Macintosh
- Make TCP/IP inactive and then active by using the TCP/IP control panel:
 1. Open the TCP/IP control panel.
 2. Choose the User Mode... command from the Edit menu, select Advanced in the User Mode window and click OK.
 3. Click the Options... bottom in the control panel.
 4. In the TCP/IP Options window, select Inactive and click OK.
 5. Close the TCP/IP control panel and save changes.
 6. Re-open the TCP/IP control panel, a dialog appears stating "TCP/IP is currently inactive. Changes won't take effect until TCP/IP is made active again. Make TCP/IP Active when closing the control panel?". Click Yes.
 7. Close the TCP/IP control panel and save changes.

DHCP: Frequently Asked Questions (3/97)

Article Created: 21 July 1995
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article covers frequently asked questions (FAQ) about Dynamic Host Configuration Protocol (DHCP).

General

- 1) What is DHCP?
- 2) What is DHCP's purpose?
- 3) How is it different that BOOTP or RARP?
- 4) Why shouldn't clients assign IP numbers without the use of a server?
- 5) Can DHCP support statically defined addresses?
- 6) Can a BOOTP client boot from a DHCP server?
- 7) Can a DHCP client boot from a BOOTP server?
- 8) Can a DHCP client update its DNS entry through DHCP?
- 9) When will the server to server protocol be defined?
- 10) Is there a DHCP mailing list?
- 11) In a subnetted environment, how does the DHCP server discover what subnet a request has come from?
- 12) Where is DHCP defined?
- 13) Can a client have a home address and still float?
- 14) How can I relay DHCP if my router does not support it?
- 15) How do I migrate my site from BOOTP to DHCP?
- 16) Can you limit which MAC addresses are allowed to roam?
- 17) Can DHCP support remote access?
- 18) What are the Gotcha's?

Info on Implementations

- 19) What freeware DHCP servers are available?

DISCUSSION -----

This article provides information which did NOT originate at Apple Computer, Inc., and Apple Computer is not responsible for its content. This information is provided for your convenience. Please contact the author for additional information.

Author: John Wobus, jmwobus@syr.edu

Date: 7/5/1995

This file: <<http://web.syr.edu/~jmwobus/comfaqs/dhcp.faq.html>>

General

1) Question: What is DHCP?

Answer: DHCP stands for "Dynamic Host Configuration Protocol".

2) Question: What is DHCP's purpose?

Answer: DHCP's purpose is to enable individual computers on an IP network to extract their configurations from a server (the 'DHCP server') or servers, in particular, servers that have no exact information about the individual computers until they request the information. The overall purpose of this is to reduce the work necessary to administer a large IP network.

3) Question: How is it different that BOOTP or RARP?

Answer: DHCP is based on BOOTP and maintains some backward compatibility. The main difference is that BOOTP was designed for manual pre-configuration of the host information in a server database, while DHCP allows for dynamic allocation of network addresses and configurations to newly attached hosts. Additionally, DHCP allows for recovery and reallocation of network addresses through a leasing mechanism.

RARP is a protocol used by Sun and other vendors that allows a computer to find

out its own IP number, which is one of the protocol parameters typically passed to the client system by DHCP or BOOTP. RARP doesn't support other parameters and using it, a server can only serve a single LAN. DHCP and BOOTP are designed so they can be routed.

4) Question: Why shouldn't clients assign IP numbers without the use of a server?

Answer: It is theoretically possible for client-machines to find addresses to use by picking an address out of the blue and broadcasting a request of all the other client machines to see if they are using them. AppleTalk is designed around this idea, and Apple's MacTCP can be configured to do this for IP. However, this method of IP address assignment has disadvantages.

- A computer that needs a permanently assigned IP number might be turned off and lose its number to a machine coming up. This has problems both for finding services and for security.
- A network might be temporarily divided into two non-communicating networks while a network component is not functioning. During this time, two different client-machines might end up claiming the same IP number. When the network comes back, they start malfunctioning.
- If such dynamic assignment is to be confined to ranges of IP addresses, then the ranges are configured in each desktop machine rather than being centrally administered. This can lead both to hidden configuration errors and to difficulty in changing the range. Another problem with the use of such ranges is keeping it easy to move a computer from one subnet to another.

5) Question: Can DHCP support statically defined addresses?

Answer: Yes. At least there is nothing in the protocol to preclude this and one expects it to be a feature of any DHCP server. This is really a server matter and the client should work either way.

6) Question: Can a BOOTP client boot from a DHCP server?

Answer: A DHCP server can be written this way. Since DHCP was developed after BOOTP, it would be logical for most server developers to support this.

7) Question: Can a DHCP client boot from a BOOTP server?

Answer: A DHCP client can be written this way, i.e. to treat a BOOTP reply as an unending lease on the IP address.

8) Question: Can a DHCP client update its DNS entry through DHCP?

Answer: There are options in DHCP through which a DHCP client can request that its DNS entry be updated. DHCP clients will be able to take advantage of planned

enhancements to the DNS protocol that will allow dynamic updates through the network.

9) Question: When will the server to server protocol be defined?

Answer: The DHC WG of the IETF is actively investigating the issues in inter-server communication. The protocol should be defined "soon".

10) Question: Is there a DHCP mailing list?

Answer: There are several:

Begin_Table

List	Purpose
----	-----
host-conf@sol.eg.bucknell.edu	General discussion
dhcp-bake@bucknell.edu	DHCP bakeoffs
dhcp-impl@bucknell.edu	Implementations
dhcp-serve@bucknell.edu	Server to server protocol

Admin requests for the host-conf list should go to host-conf-request@sol.eg.bucknell.edu; admin requests for the other lists should go to listserv@bucknell.edu.

End_Table

11) Question: In a subnetted environment, how does the DHCP server discover what subnet a request has come from?

Answer: DHCP client messages are sent to off-net servers by DHCP relay agents, which are often a part of an IP router. The DHCP relay agent records the subnet from which the message was received in the DHCP message header for use by the DHCP server.

12) Question: Where is DHCP defined?

Answer: In Internet RFCs.

RFC1541 - R. Droms, "Dynamic Host Configuration Protocol", 10/27/1993.

RFC1533 - R. Droms, "Interoperation Between DHCP and BOOTP", 10/08/1993.

RFC1532 - S. Alexander, R. Droms, "DHCP Options and BOOTP Vendor Extensions", 10/08/1993.

13) Question: Can a client have a home address and still float?

Answer: There is nothing in the protocol to keep a client that already has a leased or permanent IP number from getting a(nother) lease on a temporary basis on another subnet (i.e., for that laptop which is almost always in one office, but occasionally is plugged in in a conference room or class room). Thus it is left to the server implementation to support such a feature. I've heard that Microsoft's NT-based server can do it.

14) Question: How can I relay DHCP if my router does not support it?

Answer: A server on a net(subnet) can relay DHCP or BOOTP for that net. Windows NT can be set up that way.

15) Question: How do I migrate my site from BOOTP to DHCP?

Answer: I don't have an answer for this, but will offer a little discussion. The answer depends a lot on what BOOTP server you are using and how you are maintaining it. If you depend heavily on BOOTP server software to support your existing clients, then the demand to support clients that support DHCP but not BOOTP presents you with problems. In general, you are faced with the choice:

1. Find a server that is administered like your BOOTP server only that also serves DHCP. For example, one popular BOOTP server, the CMU server, has been patched so that it will answer DHCP queries.
2. Run both a DHCP and a BOOTP server. It would be good if I could find out the gotcha's of such a setup.
3. Adapt your site's administration to one of the available DHCP/BOOTP servers.
4. Handle the non-BOOTP clients specially, e.g. turn off DHCP and configure them statically: not a good solution, but certainly one that can be done to handle the first few non-BOOTP clients at your site.

16) Question: Can you limit which MAC addresses are allowed to roam?

Answer: Sites may choose to require central pre-configuration for all computers that will be able to acquire a dynamic address. A DHCP server could be designed to implement such a requirement, presumably as an option to the server administrator. See section below on servers that implement this.

17) Question: Can DHCP support remote access?

Answer: PPP has its own non-DHCP way in which communications servers can hand clients an IP address called IPCP (IP Control Protocol) but doesn't have the same flexibility as DHCP or BOOTP in handing out other parameters. Such a communications server may support the use of DHCP to acquire the IP addresses it gives out. This is sometimes called doing DHCP by proxy for the client. I know that Windows NT's remote access support does this.

A feature of DHCP under development (DHCPinfrom) is a method by which a DHCP server can supply parameters to a client that already has an IP number. With this, a PPP client could get its IP number using IPCP, then get the rest of its parameters using this feature of DHCP.

SLIP has no standard way in which a server can hand a client an IP address, but many communications servers support non-standard ways of doing this that can be utilized by scripts, etc. Thus, like communications servers supporting PPP, such communications servers could also support the use of DHCP to acquire the IP addressees to give out.

I am not currently aware of any way in which DHCP can support client-computers served solely by PPP or SLIP. Such a computer doesn't have the IEEE-style MAC address that DHCP requires to act as its key to determining which client-computer is which within the same subnet. Communications servers that acquire IP numbers for their clients via DHCP run into the same roadblock in that they have just one MAC address, but need to acquire more than one IP address. One way such a communications server can get around this problem is through the use of a set of unique pseudo-MAC addresses for the purposes of its communications with the DHCP server. Another way (used by Shiva) is to use a different "client ID type" for your hardware address. Client ID type 1 means you're using MAC addresses. However, client ID type 0 means an ASCII string.

18) Question: What are the Gotcha's?

Answer:

1. A malicious user could make trouble by putting up an unofficial DHCP server.
 - The immediate problem would be a server passing out numbers already belonging to some computer yielding the potential for two or more "innocent bystander" nodes ending up with the same IP number. Net result is problems using the nodes, possibly intermittent of one or the other is sometimes turned off.
 - A lot of problems are possible if a renegade server manages to get a client to accept its lease offering, and feeds the client its own version of other booting parameters. One scenario is a client that loads its OS over the network via tftp being directed to a different file (possibly on a different server), thus allowing the perpetrator to take over the client. Given that boot parameters are often made to control many different things about the computers' operation and communication, many other scenarios are just as serious.
Note that BOOTP has the same vulnerabilities.
2. The "broadcast flag": DHCP includes a way in which client implementations unable to receive a packet with a specific IP address can ask the server or relay agent to use the broadcast IP address in the replies (a "flag" set by the client in the requests). The definition of DHCP states that implementations "should" honor this flag, but it doesn't say they "must". Some Microsoft TCP/IP implementations used this flag, which meant in practical terms, relay agents and servers had to implement it. A number of BOOTP-relay-agent implementations (e.g. in routers) handled DHCP just fine except for the need for this feature, thus they announced new versions stated to

handle DHCP.

3. Some of the virtual LAN schemes, i.e., those that use the packet's IP number to decide which "virtual LAN" a client-computer is on for the purposes of TCP/IP, don't work when using DHCP to dynamically assign addresses. DHCP servers and relay agents use their knowledge of what LAN the client-station is on to select the subnet number for the client-station's new IP address whereas such switches use the subnet number sent by the client-station to decide which (virtual) LAN to put the station on.
4. Routers are sometimes configured so that one LAN on one port has multiple network (or subnet) numbers. When the router is relaying requests from such a LAN to the DHCP server, it must pass along as IP number that is associated with one of the network (or subnet) numbers. The only way the DHCP server can allocate addresses on one of the LAN's other network (or subnet) numbers is if the DHCP server is specifically written to have a feature to handle such cases, and it has a configuration describing the situation.
5. The knowledge that a particular IP number is associated with a particular node is often used for various functions. Examples are: for security purposes, for network management, and even for identifying resources. Furthermore, if the DNS's names are going to identify IP numbers, the numbers, the IP numbers have to be stable. Dynamic configuration of the IP numbers undercuts such methods. For this reason, some sites try to keep the continued use of dynamically allocatable IP numbers to a minimum.
6. With two or more servers serving a LAN, clients that are moved around (e.g. mobile clients) can end up with redundant leases. Consider a home site with two DHCP servers, a remote site with DHCP services, and a mobile client. The client first connects to the home site and receives an address from one of the two serves. He/she then travels to the remote site (without releasing the lease at the home site) and attempts to use the acquired address. It is of course NAK'ed and the client receives an address appropriate for the remote site. The client then returns home and tries to use the address from the remote site. It is NAK'ed but now the client broadcasts a DHCPDISCOVER to get a address. The server that holds the previous lease will offer the address back to the client but there is no guarantee that the client will accept that address; consequently, it is possible for the client to acquire an address on the other server and therefore have two leases within the site. The problem can be solved by using only one server per subnet/site and can be mitigated by short lease lengths. But in a very mobile environment, it is possible for these transient servers to consume more than their fair share of addresses.
7. If departments, offices, or individuals run DHCP servers with their own small address pools on LANs shared by other departments, offices, or individuals, they can find that their addresses are being used by anyone on the LAN that happens to set their IP configuration to use DHCP.

Info on Implementations

19) Question What freeware DHCP servers are available?

Answer: This is not necessarily a complete list.

950415 Bootp server:

Bootp 2.4.3 (not DHCP, but with the "DHCP patches" mentioned below,
can handle DHCP requests)

<ftp://ftp.mc.com/pub/bootp-2.4.3.tar.Z>

950425 Patched bootp server:

Bootp server version 2.4.3 with DHCP patches (does static allocation
of IP addresses)

http://www.sghms.ac.uk/~mpreston/bootp_dhcp.tar.Z

(within <http://www.sghms.ac.uk/~mpreston/tools.htm>)

950630 WIDE Project:

Akihiro Tominaga (tomy@sfc.wide.ad.jp)

WIDE Project

Keio Univ.

Japan

<ftp://sh.wide.ad.jp/WIDE/free-ware/dhcp/dhcp-1.2.1.tar.gz>

Check Archie for dhcp-1.2.1 because lots of sites distribute it.

20) Question: What commercial DHCP servers are available?

Answer: This is not necessarily a complete list.

Windows NT has one.

950407 FTP Software (Services OnNet Product)

950411 Sun (SolarNet)

950425 Microsoft

950425 Competitive Automation

950425 Silicon Graphics

950525 Process Software: server for OpenVMS

950613 NetWare/IP 2.1 will NOT support DHCP but support for enhanced
bootp will be provided. I'm guessing this means DHCP-format
packets, but no address leasing.

21) Question: Which vendors of client software currently support DHCP?

Answer: This is not necessarily a complete list.

950417 Shiva: proxy client for remote users (in Lanrovers and Netmodems)

950417 FTP Software: for DOS and Windows (included in PC/TCP OnNet and
PC/TCP networking software)

950419 Beame and Whiteside: NFS client

950419 Dirk Koeppen EDV-Beratungs-GmbH: TCP/IP DHCP Boot ROMs (TCP/IP
BOOT-PROM)

950421 Microsoft: Windows for Workgroups

950425 Sun

..TIL18237-DHCP-Frequently_Asked_Questions_3-97.pdf

950425 Competitive Automation
950425 Silicon Graphics
950425 Hewlett-Packard
950502 NetManage: Chameleon 4.5
950630 Beame & Whiteside Software: resells Dirk Koeppen
EDV-Beratungs-GmbH's TCP/IP BOOT-PROM
950705 Microsoft: MS-TCP/IP 3.11a & MS-TCP/IP 3.11b

22) Question: What are the DHCP plans of major client-software vendors?

Answer:

MacTCP: will support it; I have no news on when or what version.

Windows 95: will support it and will not support BOOTP!

Novell: has plans for client support later in 1995

IBM AIX: will support it; I have no news on when or what version.

OS/2: will support it; I have no news on when or what version.

23) Question: What Routers forward DHCP requests?

Answer: This is not necessarily a complete list.

Cisco: (from Cisco FAQ) Routers running GSYS version 9.21(4) and 10.0(3) as well as later releases.

Wellfleet/Bay: (from Wellfleet FAQ) DHCP is supported by enabling BOOTP support (with transmission and/or reception as needed).

3Com Netbuilder: Version 7.2 software can support DHCP relaying through the use of its generic UDP Helper service. Version 8.0 and later officially supports DHCP.

Xyplex: Word is that release 5.1 slated for first quarter 1996 will support it.

24) Question: What Routers include DHCP servers?

DHCP requires disk storage (or some other form of reliable non-volatile storage), making the task of DHCP service compatible with servers but incompatible with dedicated routers. There are a number of server types that can be configured to both route and serve DHCP (especially all-in-one "Internet Gateways" designed to be web servers, firewalls, etc.), but no dedicated routers.

25) Question: What Routers use DHCP to configure their IP addresses?

Answer: The DHCP RFC specifically says that DHCP is not intended for use in

configuring routers. The reason is that in maintaining and troubleshooting routers, it is important to know its exact configuration rather than leaving that to be automatically done, and also that you do not want your router's operation to depend upon the working of yet another server.

It may be possible to configure some types of more general-purpose computers or servers to get their addresses from DHCP and to act as routers. Also, there are remote access servers, often which are usually not true routers, which use DHCP to acquire addresses to hand out to their clients.

26) Question: What Servers forward DHCP requests?

Answers: Windows NT's 3.51 Service Pack 3 (and 4) includes a BOOTP (& DHCP) relay agent as part of "Multi Protocol Router". 3.51). For Novell servers, there are NLMs that forward BOOTP requests, thus DHCP requests.

The "BOOTPFWD NLM" is included in NetWare 4.1. You can get this support in NetWare 3.11 and 3.12 also, but you must apply the TCP31A.EXE patch which is located on Netware. Here are two such NLMs that are available online:

<ftp://netlab2.usu.edu/misc/bootpfd.zip>(unsupported Novell software,1993)
<ftp://netlab2.usu.edu/misc/bootp311.zip>(unsupported Novell software,1991)

Also for Novell servers, the DHCP server that comes with NetWare/IP 2.2 can be configured to be just a BOOTP/DHCP forwarding agent.

27) Question: Which implementations support or require the broadcast flag?

Answer: The broadcast flag is an optional element of DHCP, but a client which sets it works only with a server or relay that supports it.

Clients

- Microsoft Windows NT -DHCP client support added with version 3.5 sets the broadcast flag. Version 3.51 and later no longer set it. The exception is in the remote access support: it sets the flag when it uses DHCP to acquire addresses to hand out to its PPP clients.
- tcp/ip-32 for Microsoft Windows for Workgroups (WFW)- Version 3.11a sets it, but version 3.11B doesn't.
- Microsoft Windows 95 - Does not set the broadcast flag.

28) Question: How can I run Windows 95 without a DHCP server?

Answer: Not really a DHCP question, but it has been asked a lot, particularly by sites for which changing from BOOTP represents a lot of work. Some choices:

1. Use no server at all for the Windows 95 clients: set the addresses in each client's setup.
2. Install a non-Microsoft TCP/IP stack for Windows 95 that supports BOOTP.

..TIL18237-DHCP-Frequently_Asked_Questions_3-97.pdf

3. Switch from your current BOOTP server to one that supports both BOOTP and DHCP.
4. I know nothing about it, but there exists code to make Windows 95 run BOOTP:
<ftp://ftp.stanford.edu/pub/mailling-lists/win95netbugs/billgpc.zip>

A Document that addresses this question is the Windows 95tm Networking FAQ, <<http://www-leland.stanford.edu/~llurch/win95netbugs/faq.html>>

29) Question: Do any servers limit the MAC addresses that may roam?

Answer: IBM's AIX and OS/2 WARP DHCP servers.

30) Question: What analyzers decode DHCP?

Answer: Release 5.0 of Network General Corporation's Sniffer software. I believe one of the free Unix implementations has included in its distribution a program that captures and decodes BOOTP and DHCP negotiations. Microsoft's SMS includes a protocol analyzer called "Network Monitor" that decodes DHCP. All NT software includes a remote agent for it.

31) Question: What administration tools administer DHCP configurations?

Answer: Quadritek's QIP network administration product includes an interface to Competative Automation's JOIN DHCP server.

32) Question: What are the Gotcha's specific to various implementations?

Answer: In many cases, new releases have solved the problems that have been identified with various DHCP implementations.

1. There have been servers that are inflexible as to the list of configuration parameters they were able to serve. If your client requires certain parameters, you could find such a server unusable.
2. I hate to cast wide suspicions, but I've heard occasional word on client DHCP implementations that do not implement the entire protocol. Doing so requires that the software module be able to wake up again after a specified period of time and "renew the lease", i.e., ask to continue using the IP number. This is at least one feature of DHCP that is very hard to implement in some simpler systems.
3. There are a number of issues regarding the patched bootp servers. These have been reported to re DD2.4.3:
 - 'When run from inetd, I had problems with "Could not bind port" and DHCP request failure. I don't know why, and the problem went away when bootpd is run as a daemon.'
 - 'Unless you set "dl" to some value in the bootptab file, the DHCP lease time, renewal time and prebinding time will be rubbish, which will cause occasional renewal problems.' One symptom you might see is Microsoft DHCP implementations using 5-minute leases, which is their default. Other

implementations may not run at all.

4. Early Microsoft DHCP client implementations required the broadcast bit. Current ones do not.
5. I have heard a vague complaints about the Microsoft implementations of DHCP: that it does not follow the standards. I could use details.
6. Early Apple Open Transport implementations did not always fill out packets to BOOTP's 300-byte minimum, thus BOOTP forwarding agents that follow the BOOTP RFC and discard such packets end up discarding such DHCP packets, causing some of the functions to fail. Open Transport 1.1 fixes this.
7. The very first announced release of Carnegie Mellon's server, dhcp-3.3.6, circa March 1996 has shown signs of needing to be shaken out to be more easily compiled outside of its development environment.

33) Question: How do I get a DHCP Client using Open Transport to release or renew a DHCP lease before the lease has expired?

Answer: Open Transport clients release their DHCP address lease whenever the TCP/IP stack becomes inactive. This can be accomplished by:

- Restarting the Macintosh
- Make TCP/IP inactive and then active by using the TCP/IP control panel:
 1. Open the TCP/IP control panel.
 2. Choose the User Mode... command from the Edit menu, select Advanced in the User Mode window and click OK.
 3. Click the Options... bottom in the control panel.
 4. In the TCP/IP Options window, select Inactive and click OK.
 5. Close the TCP/IP control panel and save changes.
 6. Re-open the TCP/IP control panel, a dialog appears stating "TCP/IP is currently inactive. Changes won't take effect until TCP/IP is made active again. Make TCP/IP Active when closing the control panel?". Click Yes.
 7. Close the TCP/IP control panel and save changes.

Open Transport TCP/IP Configuration (11/96)

Article Created: 21 July 1995
Article Reviewed/Updated: 8 November 1996

TOPIC -----

This article provides information for configuring Open Transport TCP/IP.

DISCUSSION -----

Open Transport/TCP is supported over, but not limited to, Ethernet, Token Ring, and AppleTalk (as MacIP). It is also supported over serial lines when using backward compatible MDEV support (for example, MacPPP and InterSLIP).

Open Transport/TCP is configured using the TCP/IP Control Panel. Configuration may be done manually, or via a BOOTP, DHCP, RARP, or MacIP server. The steps to follow using each of these methods are detailed below.

By default, the TCP/IP Control Panel comes up in basic mode. Advanced or administration mode may be entered via the Edit menu. These modes allow expert users additional choices as well as the ability to augment information returned from a configuration server or to fill in gaps in the returned information.

The TCP/IP Control Panel may be used at any time to reconfigure the system. However TCP will not notice the new configuration until it has unloaded from the system. By default, this takes about 2 minutes after the last application using TCP or UDP has gone away.

Here is a description of the fields in the TCP/IP Control Panel:

Connect via:

This is where you select the interface the system is going to use. This can include, but is not limited to, Ethernet, Token Ring, AppleTalk (MacIP), and MacPPP.

Configure:

This is where you select how the system will obtain its IP address. The choices are Manually, BootP, DHCP, and RARP.

IP Address:

This is where you enter the systems IP address if you have configured it to obtain its address manually. If BootP, DHCP, or RARP were selected for the "Configure:" field, the text "<supplied by server>" will be displayed.

Domain name:

This is the default domain name used for domain name searches. For example, if a domain name of "apple.com" is configured, a search for "scott" would initially search for "scott.apple.com." It is not always necessary to fill in this field when configuring from a BootP or DHCP server since it may be returned along with the IP address. It is not necessary to have a domain name entered in this field.

Admin domain:

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches. For example, if my domain is tech.support.apple.com, and my admin domain is set to apple.com, a search for the name "scott" would first look for scott.tech.support.apple.com, then for scott.support.apple.com, then for scott.apple.com. Implicit searching will not be done unless an Admin Domain is explicitly setup and the default domain is a subdomain of the Admin Domain (per RFC 1535). If the name "scott" is not found here and Search domains are present, they are searched as well.

Search domain names:

In Advanced User mode only, you may enter Search domains. See the "Domain Name Resolver Information" for complete details on how searching and the DNR work.

Domain Name Resolver Information

When a client of the DNR requests a name-to-address mapping, the DNR checks for a "." at the end of the name. If it exists, the name is assumed to be fully qualified (see RFCs 1034 and 1035 for an explanation of the Domain Name System). Otherwise, if the name contains at least one "." internally, it is considered to be provisionally fully qualified. Otherwise, the name is assumed to be partially qualified, and the DNR will begin a search for that name in the domain name in the "Domain name:" field. If it is not found there, and there is an Admin domain configured, implicit searches will take place as described in the "Admin domain" section. If the name is still not found, the Search domains are searched. For each search domain, the configured name servers are contacted in the order specified. If the name is resolved in the first search domain, that answer is returned. If an authoritative answer that the "name-does-not-exist" is returned, the DNR begins the search in the next configured search domain. The search continues through the domains, and if no match is found, the DNR will search the

..TIL18238-Open_Transport_TCP-IP_Configuration_11-96_(TA26789).pdf

root domain if it makes sense to do so. The DNR has an overall timeout of 2 minutes after which it will abandon its search.

Subnet mask:

This is for the subnet mask for the network the system is connected. For example, on a class C net which uses 4 bits of the host field for subnetting, the subnet mask should be entered as "255.255.255.240".

Router address:

This is for the IP address of the default IP router located on the network the system is on.

Name server addr:

This is for the IP address(es) of one or more Domain Name Servers.

Configuring Open Transport/TCP:

=====

Manual Configuration

To manually setup Open Transport/TCP, follow these steps:

Step 1

Select the interface to use, or pick "AppleTalk (MacIP)" to run over AppleTalk on the interface selected in the AppleTalk control panel.

Step 2

If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

Step 3

Select "Manually" as the configuration method.

Step 4

Fill in the IP address in dot notation (for example, 128.1.1.1).

Step 5

Fill in the default domain extension to be used on name searches.

Step 6

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

Step 7

Fill in the subnet mask in dot notation.

Step 8

Fill in the IP address of the default IP router.

Step 9

Fill in the IP address(es) of one or more Domain Name Servers.

Step 10

In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

Step 11

If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

DHCP Configuration

To use a DHCP server to setup Open Transport/TCP, follow these steps:

Step 1

Select the interface to use in the AppleTalk control panel.

Step 2

If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

Step 3

Select "Using DHCP" as the configuration method.

Step 4

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

Step 5

In Advanced User mode, a subnet mask may be entered but is not required. If a value is entered, it will be used if no subnet mask is returned from the DHCP server. Otherwise, any value entered is ignored.

Step 6

In Advanced User mode, the manually entered IP addresses of routers are attached to the end of the (possibly empty) list of IP routers returned by the DHCP server.

Step 7

In Advanced User mode, the manually entered IP addresses of Domain Name Servers are attached to the end of the (possibly empty) list of Name Servers returned by the DHCP server.

Step 8

In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

Step 9

If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

DHCP Address Leases

DHCP provides a network administrator with the ability to configure a host's IP address either for an unlimited or for a limited period of time. The limited lease period is under the network administrator's control and is non-negotiable. Leases may, however, be renewed at the option of the configuring server.

Open Transport/TCP fully supports DHCP address leases. Should an interface's IP address lease expire, the interface will be closed down. However, Open Transport/TCP will automatically attempt to renew any address lease that reaches it's Renewal Interval, which defaults to half of the lease's lifetime, but may be configured to a different interval by the configuring server. Renewal will be attempted regardless of how many times the lease has already been renewed.

BootP Configuration

To use a BootP server to setup Open Transport/TCP, follow these steps:

Step 1

Select the interface to use, or pick "AppleTalk (MacIP)" to run over AppleTalk on the interface selected in the AppleTalk control panel.

Step 2

If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

Step 3

Select "Using BootP " as the configuration method.

Step 4

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

Step 5

In Advanced User mode, a subnet mask may be entered but is not required. If a value is entered, it will be used if no subnet mask is returned from the BOOTP server. Otherwise, any value entered is ignored.

Step 6

In Advanced User mode, the manually entered IP address of the router is attached to the end of the (possibly empty) list of IP routers returned by the DHCP server.

Step 7

In Advanced User mode, the manually entered IP addresses of Domain Name Servers are attached to the end of the (possibly empty) list of Name Servers returned by the DHCP server.

Step 8

In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

Step 9

If a Hosts file is required, select it using the Hosts file button. For details

about the Hosts file, see the description which follows.

RARP Configuration

To use a RARP server to setup Open Transport/TCP, follow these steps:

Step 1

Select the interface to use, or pick "AppleTalk (MacIP)" to run over AppleTalk on the interface selected in the AppleTalk control panel.

Step 2

If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

Step 3

Select "Using RARP" as the configuration method.

Step 4

Fill in the default domain extension to be used on name searches.

Step 5

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

Step 6

Fill in the subnet mask in dot notation.

Step 7

Fill in the IP address of the IP router.

Step 8

Fill in the IP address(es) of one or more Domain Name Servers.

Step 9

In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

Step 10

If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

MacIP Server Configuration

To use a MacIP Server to setup Open Transport/TCP, follow these steps:

Step 1

Select "AppleTalk (MacIP)" as the interface to use. TCP will now run over AppleTalk on the interface selected in the AppleTalk control panel.

Step 2

Select "Using MacIP Server" as the configuration method.

Step 3

Select the zone the DDP/IP Gateway is in using the "Select Zone..." button.

Step 4

Fill in the default domain extension to be used on name searches.

Step 5

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

Step 6

If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

Hosts File

Open Transport/TCP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is found in the System's Preferences folder. This file is parsed when Open Transport/TCP is initialized. As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (see RFC 1035 page 33).

Supported features include blank lines, comments (indicated by a semicolon), and data entry. Comments may begin at any location in a line; they may follow data entry on the same line. A comment extends from the semicolon to the end of the line. Data entry must follow the format:

```
<domain-name> <rr> [<comment>]
```

where <domain-name> is an absolute or Fully Qualified domain name (which, however, need not be terminated by a dot, but must contain at least one dot internally) and where

```
<rr> = [<ttl>] [<class>] <type> <rdata> OR [<class>] [<ttl>] <type> <rdata>
```

The only class currently supported is IN (Internet Domain); ttl (time to live; indicates the record's configured lifetime) is in seconds; and type can be A (host address), CNAME (canonical name of an alias), or NS (name server). If ttl is not present the entry is assumed to have an infinite lifetime; this may also be indicated by specifying a ttl of minus-one (-1).

\$INCLUDE and \$ORIGIN are not supported.

Examples of valid data entry lines including comments:

```
apple.com      A          130.43.2.2          ; address of host apple.com
foobar         CNAME      barfoo.apple.com ; canonical name for the host
                                     ; whose local alias is "foobar"
mit.edu.       86400      NS    achilles.mit.edu ; name server for mit.edu domain,
                                     ; entry has a one-week lifetime
```

Open Transport/TCP's Hosts file support is somewhat more stringent than that of MacTCP. MacTCP permitted violation of the Fully Qualified requirement for

<domain-name>, and this feature was often used to avoid the necessity for entering CNAME records by associating an address directly with a non-fully qualified name. For instance, this format:

```
charlie      A      128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured domains). If such a line exists in your hosts file, kOTBadNameError will be returned when the Hosts file is read. To accomplish the same effect, use this format instead:

```
charlie      CNAME    myhost.mydomain.edu
myhost.mydomain.edu  A      128.1.1.1
```

This associates the local alias "charlie" with the fully qualified domain name "myhost.mydomain.edu" and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

In general, use of the Hosts file is discouraged, as it often simply wastes memory by permanently configuring data that may only rarely be accessed. It is also highly susceptible to misuse by users who try to configure far too much information internally in order to avoid accessing DNS servers. Besides tying up memory, this practice is exactly the reason that the Domain Name System was developed in the first place - to eliminate the performance degradation caused by use of enormous hosts files.

Should a Hosts file be used, every effort should be made to keep it as small as possible and to only include entries that will be accessed frequently.

QuickTime VR: Glossary of Terms (7/95)

=====

Article Created: 21 July 1995

TOPIC -----

This article describes some of the common terms used when discussing QuickTime VR technology.

DISCUSSION -----

Authoring

The process of developing a multimedia title. With QuickTime VR, the authoring process includes four steps:

- Planning
- Capturing images
- Digitizing the images
- Authoring/compositing.

Dicing

A QuickTime VR authoring process that compresses source and object PICT files, and creates MooV files. During dicing, PICT files are compressed using a compressor specified by one of the MPW scripts for dicing.

Hot spot

An interactive area in a QuickTime VR movie. Link hot spots allow a movie viewer to navigate from one node to another in the scene. Object hot spots allow a movie viewer to pick up, examine, or get more information about an object in the scene.

MPW

Macintosh Programmer's Workbench. Part of the development environment (along with HyperCard) required for authoring QuickTime VR movies.

Navigable movie

A type of VR object that allows you to manipulate a photographically captured or computer-rendered object. Also known as an object movie.

Node

A position in a scene from which you view a 360° panoramic image. Multiple nodes linked together comprise a scene. In a multi-node scene, users can jump from node to node to navigate about the scene.

Object movie

See navigable movie.

Panorama

A 360° photographic view from a position called a node. A panorama is captured for each node in a scene.

Panoramic movie

A VR movie based on a photographically captured 360° node.

Panoramic PICT

A 360° band of blended photographic images, created by the Stitcher.

Photo CD

A compact disc that contains digitized images made from photographic negatives. Photo CD is a Kodak technology.

QuickTime VR

Apple's new technology for creating VR experiences. With QuickTime VR, you can create scenes based on high-quality real-world photographic images. QuickTime VR movies can be played back on Macintosh and Windows-based computers; no specialized hardware, software, or accessories are needed.

Scene

An environment for which you create a QuickTime VR movie. Scenes can be photographed or rendered on the computer.

Scene Editor

A QuickTime VR authoring tool that lets you add and position nodes in a scene, link nodes, and link objects to nodes.

Stitching

A QuickTime VR Authoring process that creates a panoramic PICT of blended photographic images of a node.

Title

A multimedia product usually distributed on CD-ROM.

Virtual Reality (VR)

The experience of exploring and interacting with a spatial environment through a computer.

Support Information Services

Copyright 1995, Apple Computer, Inc.

System 7.1P6: Clean Restore Macintosh Performa Computers (7/95)

Revised: 7/21/95
Security: Everyone

System 7.1P6: Clean Restore Macintosh Performa Computers (7/95)

=====

Article Created: 21 July 1995

TOPIC -----

This article describes the procedure for a Clean Restore (Install) for a Macintosh Performa computer with no built-in CD-ROM drive and which is running System 7.1P or System 7.1.2P for Performa computers. This article assumes that you have backed up your system with Apple Restore, and have a Utilities disk and the backup disks.

This article applies to all Macintosh Performa 400 series computers, as well as some Performa 600 and 630 series computers.

If you are using System 7.5, follow the clean install instructions for System 7.5, listed elsewhere in the Tech Info Library.

DISCUSSION -----

You may wish to perform a "clean install" when normal extensions troubleshooting fails or when the troubleshooting process becomes too complex.

The process essentially allows you to "start over" with a new System Folder. You will not lose any data, but any software or fonts or configuration information which was stored in the old System Folder will become inactive.

This clean install procedure provides you with a stable foundation from which you can proceed to troubleshoot an abnormal situation.

A regular system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forces the restoration software to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in

troubleshooting.

Restart From the Utilities Disk

Step 1

Shut down or turn off your computer and insert the Utilities disk.

Step 2

Turn it back on. After a while, the computer will have started by using the system software on the Utilities disk. This will take longer than normal, perhaps up to three minutes.

The desktop pattern may change. This is normal, and is a consequence of having started the system with a different startup volume. In this case, we are starting from the Utilities disk.

If you cannot start with the Utilities disk (that is, you do not see your Utilities disk icon on the top right hand side of the screen, above the hard disk, do not proceed. Call 800-SOS-APPL for further assistance.

Run Disk First Aid

Disk First Aid can detect and repair problems with a hard disk's directory structure. Before proceeding with further troubleshooting, it is important to verify that the underlying directory structure is functioning satisfactorily.

Step 1

Click on the Disk First Aid icon in the Utilities window, then select Open from the File menu. You can also double-click on the Disk First Aid icon. The Disk First Aid icon looks like a little ambulance.

Step 2

There are two distinct ways that Disk First Aid might appear.

If your version has a row of disk icons at the top of the window, and a button labeled Verify, click on the hard disk icon within the Disk First Aid window. Click on the Verify button.

If your version has four buttons, marked Drive, Eject, Open, and Cancel, check the name of the volume in the window. If it says Utilities, click the Drive button ONCE. It should then have the name of your hard disk. Click on the Open button. Another window will appear: click on the Start button. Nothing dramatic will happen while it is testing, but within a minute, the Start button will either hilite again, and a message will appear saying everything is fine, or it will report a problem.

Step 3

If Disk First Aid finds a problem, click on the Repair button.

If you receive a note stating that Disk First Aid cannot repair the hard disk, you should back up any irreplaceable data or application software on the hard disk and re-initialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup, which is also in the Launcher.

If you have a Performa 630 series computer, use Internal Drive Format.

Step 4

Select "Quit" from the File menu.

Update Hard Disk Driver

You should update the drivers with the version of Apple HD SC Setup that is on the Utilities disk, following these steps:

Note:

If you have a Performa 630 series computer, ignore this step. Because you have an IDE drive instead of a SCSI drive, you do not have any drivers to update.

Step 1

Click on the HD SC Setup icon in the Launcher.

Step 2

Click on the Update button. If the Update button is not hilited, or you see a message that "Drive Selection Failed," you should verify whether your hard disk has been reformatted with a third-party driver or uses driver-level compression or security software.

Step 3

When you are finished, click Quit to return to the desktop.

Step 4

Select "Restart" from your Special menu. The Utilities disk will eject; push it right back in.

Check Available Hard Disk Space

Be sure you have at least 20 MB available on the hard disk where you plan to install the system software. If there's less than 20 MB available, you'll need to identify and delete some unnecessary files by moving them to the Trash.

Make sure you do not delete anything you do not have a back-up for. If necessary, copy the files onto individual diskettes or other media before moving them to the Trash.

You can identify the amount of hard disk space available by double-clicking on your hard disk icon on the right hand side of the screen. At the top of the hard disk window, you should see a legend which indicates how much space is available. If you do not, select "by Icon" from your View menu.

Once you identify and remove redundant items, choose Empty Trash from the Special menu, and you'll have more disk space available.

Disable the System Folder

You disable the System Folder by moving the Finder and renaming the System

Folder to something else.

Step 1

Open your hard disk's icon and locate the System Folder.

Step 2

Open the System Folder and locate the Finder.

Step 3

Move the Finder to the Trash. If you get an error message saying that items can't be moved to the desktop because it is locked, try again: you probably missed the Trash.

Step 4

Move your System suitcase (the icon with a small suitcase) to the Preferences folder. We keep the System suitcase in case there are sounds inside it you may wish to recover later on.

Step 5

Close the System Folder's window and rename the System Folder to "Storage." Do this by first clicking on the closed System Folder icon, then pressing the Return key. This should hilite the words "System Folder," surrounding them with a white rectangle. Whatever you type will replace what is there. You can also hilite "System Folder" by clicking ONCE in the middle of those words, then waiting for the words to hilite.

Step 6

Close any open windows on your desktop.

Restart Your Computer

Choose Restart from the Special menu. This will automatically eject your Utilities disk.

After a few seconds, you should see a picture of a disk with a flashing question mark.

If your Macintosh computer starts up from the hard drive, you have an extra System Folder on the hard disk. You need to locate it (use the "Find" option from the File menu in the Finder) and delete it or disable it as described in the previous section, then restart.

When you get the disk with the flashing question mark on your screen, you can continue.

Restoring The System

Step 1

When you see the disk with a flashing question mark, insert the Utilities disk again. The computer should start up with the system software on the Utilities disk

Step 2

Once the computer has finished starting, double-click on Apple Restore.

Step 3

Read the welcome screen, then click on the Continue button.

Step 4

Respond to any messages you see on the screen. At this point, you will need all of your backup disks.

Step 5

When the system is finished, click the Restart button or press the Return key on your keyboard. You will have then successfully restored your files.

Step 6

After the computer finishes restarting, select Empty Trash. The old Finder will be in there, and we can get rid of it at this point.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of the clean restore procedure. You may wish to use your computer for a few days before re-introducing any other extensions or fonts.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If at all possible, we strongly recommend that you reinstall these items from their original disks, just in case one of the items had become corrupted and contributed to the problem.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the equivalent place in the new System Folder. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

Step 1

Open each corresponding folder within the System Folder and the Storage folder and then compare the contents.

Step 2

Move an item that isn't already in the new System Folder and its subfolders from the Storage folder and its subfolders.

Step 3

Restart your Macintosh.

It is recommended you proceed slowly when doing this. This is part of the troubleshooting process, so you do not want to move everything back at once:

instead, move a few at a time, restart, and test to make sure the original problem has gone away.

If you move the items back and the problem should recur, you probably have an extensions conflict. Done properly, you will know which set of extensions cause the problem, but sometimes intermittent extensions conflicts will require more troubleshooting.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

We normally recommend you keep the Storage folder around for a couple of months, or until you're **completely** certain that you do not need any files from it.

When the Macintosh behaves as expected, move the Storage folder to the Trash, and choose Empty Trash from the Special menu.

PowerBook: Power & Battery Frequently Asked Questions (4/97)

Article Created: 21 August 1995
Article Reviewed/Updated: 04 April 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about PowerBook batteries and power issues.

Questions Answered in this FAQ
=====

- 1) How do I reset the power manager for my PowerBook?
- 2) I do not seem to be getting the battery life I once did. What should I do?
- 3) What are the various types of PowerBook batteries? Are they interchangeable?
- 4) Through troubleshooting, I have come to the conclusion my PowerBook battery is bad. It is my understanding that this battery contains unpleasant chemicals. How can I safely dispose of this battery?
- 5) What is battery memory? Should I buy a reconditioner for my battery to address battery memory?
- 6) I recently purchased a Type 3 battery for my PowerBook Duo 230. The battery works fine in my PowerBook, but a red light appears on my external battery recharger when I insert the battery. The recharger works fine with the battery that came with my PowerBook. What could be wrong?
- 7) It is my understanding that Apple no longer sells the PowerBook 100 battery. What can I do when my faithful PowerBook 100 needs a new battery?
- 8) I recently purchased a new battery for my 500 series PowerBook. My PowerBook isn't charging/recognizing this battery. What should I do?
- 9) How long can I store my PowerBook battery?

- 10) My PowerBook will not start off battery at all. Should I just buy a new battery, or is there something else I can do?
- 11) How can I increase my PowerBook computer's battery life?
- 12) What is processor cycling and how do I turn it off?
- 13) Can I charge my PB from a car cigarette lighter?
- 14) I am taking my PowerBook to another country, do I need a power converter?
- 15) Can the PowerBook 5300/190 use two batteries simultaneously?
- 16) Where else can I go for answers?

DISCUSSION -----

- 1) Question: How do I reset the power manager for my PowerBook?

Answer: Listed below are the particular methods for resetting the power manager on all PowerBook computers. Resetting the power manager can be useful if the computer does not turn on at all or if it is displaying power-related anomalies. Corruptions in the power manager are typically caused by power surges. Plugging in the PowerBook improperly can also corrupt the power manager code. The AC adapter should always be connected to a live AC outlet before it is plugged into or removed from the PowerBook.

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

All of the following Power Manager Reset procedures for all of the Macintosh PowerBook computers will permanently remove a RAM disk, if present, and all of its contents.

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

What Causes The Power Manager To Need Resetting?

=====

While there are several reasons a PowerBook may need its power manager circuitry reset, most of which involve some kind of power interruption to the unit, there is one very common cause - improper use of the AC Adapter.

The PowerBook power manager circuitry is most often "corrupted" by the AC Adaptor not being plugged into the PowerBook in the proper order. The AC Adapter should ALWAYS be plugged into the AC (wall) outlet before it is plugged into the PowerBook itself.

If you are using a power surge protector bar, make sure the power bar is powered on (usually has some kind of indicator light) before you plug the PowerBook AC Adapter into it. Also never turn off the power to the PowerBook by turning off the power bar's switch.

PowerBook 100

=====

Step 1

Remove the AC adapter and the battery.

Step 2

Flip the battery contact switch on the rear of the unit to the down position.

Step 3

Let the unit sit without power hooked up for 3-5 minutes.

Step 4

Simultaneously press and hold the rest and interrupt buttons on the side of the unit for 15 seconds.

Step 5

Reinstall the battery, reconnect the AC adaptor if necessary and flip the battery contact switch on the rear of the unit to the up position.

PowerBook 140, 145, 145 B and 170

=====

Step 1

Remove the AC Adapter and the battery.

Step 2

Let the unit sit without power connected for 3 to 5 minutes.

Step 3

Using two paper clips, simultaneously press and hold down the reset and interrupt buttons for 5-10 seconds.

* Both recessed buttons (commonly known as the reset and interrupt buttons) are located next to the power button on the back panel of the PowerBook.

Step 4

Reinstall the battery and, if necessary, reconnect the AC adapter.

PowerBook 160, 165, or 180

=====

Step 1

Remove the AC Adapter and the battery.

Step 2

Let the unit sit without power connected for 3 to 5 minutes.

Step 3

Reinstall the battery and, if necessary, reconnect the AC adapter.

NOTE: Steps 1 & 2 will usually reset the power manager, however if the computer still exhibits the same problem, redo steps 1 & 2 and then follow the steps listed below before reinstalling the battery.

* Using two paper clips, simultaneously press and hold down the reset and interrupt buttons for 5-10 seconds.

* Both recessed buttons (commonly known as the reset and interrupt buttons) are located next to the power button on the back panel of the PowerBook.

PowerBook 150

=====

Step 1

Remove the power adapter and battery from unit.

Step 2

Push the reset button in the back of the unit with a paper clip and hold for 5 to 10 seconds.

Step 3

Plug the AC Adapter into the AC (wall) outlet.

Step 4

Reconnect the power adapter and push the reset button in back again, but just briefly. You should hear a small pop from the speaker; do not be concerned.

Step 5

Push main power button in back (large exposed button). The unit should power up.

Step 6

Apple suggests charging the battery for at least 8 hours before running on

battery power.

If the PowerBook powers on, the battery may be reinserted. If it fails to start, the PowerBook may require service.

PowerBook 500 series

=====

Step 1

Remove the AC adapter and the battery.

Step 2

Let the unit sit without power hooked up for 3-5 minutes.

Step 3

Simultaneously press and hold down the Command, Option, Control, and Power On keys for 5-10 seconds.

Step 4

Reinstall the battery and, if necessary, reconnect the AC adapter.

PowerBook 200 and 2300 Series

=====

Follow this procedure on the PowerBook 200 and 2300 (Duo) series computers:

Step 1

Press and hold the power button on the rear of the 200 or 2300 series computer for 30-45 seconds.*

Step 2 (see Caution)

If resetting the power manager chip does not solve the problem, reset the code for the power manager chip by removing all power sources and letting the unit sit for 10 minutes. (Disconnect the AC adapter, remove the battery and the internal backup batter.) This forces the PowerBook Duo to reload the power manager code from the system software.

****Caution****

Authorized Apple Service technicians may remove the internal back up battery to reset the power manager. If you are not an authorized Apple Service technician, please note that removing the internal backup battery is not a simple procedure and is not recommended. If anything is damaged in your attempt to remove the battery, it will not be covered under warranty.

PowerBook 190, 1400, 3400 & 5300 Series

=====

The PowerBook 190, 1400, 3400 & 5300 Series have two different ways to reset the power manager. The only difference between series is the location of the reset button. See the table below for the location of the reset button for each PowerBook series.

Begin_Table

PowerBook	Reset Button Location (on rear of computer)
-----	-----
190 Series	Below the video out port
1400 Series	Between the ADB and Serial ports
3400 Series	Left of the Serial port
5300 Series	Below the video out port

End-Table

Resetting the Power Manager

Step 1

If the computer is on, turn it off.

Step 2

Restart the computer by holding down the reset button for 10-20 seconds. (See chart above for location of the reset button for your PowerBook series.)

Step 3

If the computer does not restart, repeat step 2 three or four times.

Resetting the Power Manager and PRAM

Resetting ("Zapping") the Parameter RAM (PRAM) when the computer is shutdown also resets Power Manager (also called the "PG&E"). This process resets both the power manager and the Parameter RAM.

Step 1

If the computer is on, turn it off.

Step 2

Make sure the Caps Lock key is not down.

Step 3

Restart the computer. Immediately after hearing the startup sound, simultaneously press and hold down the Command-Option-P-R keys. (If you do not hold down the key combination within 5-10 seconds after the computer restarts, you will need to repeat steps 1-3.)

Step 4

Hold down the keys until you hear the startup sound again. Then release the keys.

Step 5

If the computer shuts itself off, press the reset button on the back of the computer to turn it back on. (See chart above for location of the reset button for your PowerBook series.)

Step 6

When the computer has finished starting up, restore any custom settings for the desktop pattern, memory, network, AppleTalk, trackpad, power conservation and so forth.

PowerBook 5300 or 190 That Won't Power On

=====

This process resets both the power manager and revives PowerBook 5300 and 190 computers which do not initially turn on. In other words, reviving a machine that appears to be a "dead" unit.

Step 1

Unplug AC adapter and remove battery.

Step 2

Press and hold the Reset button on the back of the machine for about 45 seconds. (See chart above for location of the reset button.)

Step 3

Plug the AC Adapter into the AC (wall) outlet.

Step 4

Attach only the AC Adaptor to the PowerBook (don't put in the battery).

Step 5

Press the Reset button one more time and the PowerBook should startup after a brief pause.

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

All of the aforementioned Power Manager Reset procedures for all of the Macintosh PowerBook computers will permanently remove a RAM disk, if present, and all of its contents.

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

The Power Manager code can be fully purged by having an authorized service technician disconnect the internal backup battery and let the unit sit for 1 minute with all power removed (the battery pulled and the AC Adapter disconnected). This forces the PowerBook to reload a fresh copy of the code from the system software.

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

Authorized Apple Service technicians may remove the internal back up battery to reset the power manager. If you are not an authorized Apple Service technician, please note that removing the internal backup battery is not a simple procedure and is not recommended. If anything is damaged in your attempt to remove the battery, it will not be covered under warranty.

2) Question: I do not seem to be getting the battery life I once did. What should I do?

Answer: The Apple Technical Information Library contains some good articles on maximizing battery life. Use the search string "PowerBook and tips" to find the article "PowerBook: Power and Battery Saving Tips." In general, for all PowerBook computers experiencing decreasing battery life, you will want to reset the PowerBook power manager, and check power conservation settings in the PowerBook control panel.

Next, with the PowerBook 140-190, 200, 2300, 500, and 5300 series computers, recondition the battery. To do this, operate as long as possible off the PowerBook battery, then shut down and charge the battery overnight. If performance is still not as good as should be expected, you are likely dealing with a bad battery. The PowerBook 270c, 280, 280c, 2300, 190, and 5300 can use the Battery Reconditioning software (included on the Battery Tools disk or in the Utilities Folder on the Hard Drive) to recondition the battery automatically. The PowerBook 500 series can use the Intelligent Battery Update.

You can download Battery Tools 2.0 and the Intelligent Battery Update at the following path:
Apple Software Updates -> U.S. -> Macintosh -> System Software -> Other System Software.

Note that the PowerBook 200 and 2300 series computers use a different version of the Battery Reconditioning program than the PowerBook 5300 and 190 series computers do. The version that the PowerBook 5300 and 190 series computers use is not currently available on-line.

3) Question: What are the various types of PowerBook batteries? Are they interchangeable?

Answer: All 100 series PowerBook computers except the PowerBook 100 use a nickel-cadmium (NiCad) battery. The PowerBook 100 uses a lead acid battery. The PowerBook 100 must use a lead acid battery, and no other 100 series PowerBook can use the PowerBook 100 type battery. Other than that, the 100 series batteries are interchangeable. Color 100 series PowerBook computers should be used with NiCad batteries model number M5654.

All 200 series PowerBook computers use nickel metal hydride (NiHy) batteries. PowerBook 200 series batteries are interchangeable, but earlier 200 series PowerBook computers, such as the PowerBook Duo 210 or 230, will require special software to use later model batteries, such as the Type 2 or Type 3 battery. The 2300 series uses the Type 3 battery. Use of a Type 2 battery requires PowerBook Duo Enabler 1.0 or System 7.5; use of a Type 3 battery requires the Type III Battery Extension, PowerBook Duo Enabler 2.0 and system software 7.1.x, or System 7.5. Note that System 7.5.1 requires the Type III Battery Extension only if you are using an Apple external battery recharger.

All 500 series PowerBook make use of a nickel metal hydride (NiHy) intelligent battery. There is only one type of battery for this family of PowerBook computers, and it can be used by any 500 series PowerBook.

The 5300 and 190 series PowerBook computers also use nickel metal hydride (NiHy) batteries.

4) Question: Through troubleshooting, I have come to the conclusion my PowerBook battery is bad. It is my understanding that this battery contains unpleasant chemicals. How can I safely dispose of this battery?

Answer: Apple utilizes lead-acid, nickel-hydride, and nickel-cadmium batteries in our portable products. These batteries should be returned to Apple for recycling or proper disposal.

Customers can take their failed batteries to an Apple-authorized service provider who can utilize the Apple Direct Air Shipping and Handling Program to return the failed batteries.

If the batteries are physically damaged, do not attempt to return them to Apple. Dispose of them according to your local ordinances.

5) Question: What is battery memory? Should I buy a reconditioner for my battery to address battery memory?

Answer: For an overview of battery memory, review the article "PowerBook Batteries: Memory Effect" available in the online Apple Technical Information Library. Use the search string "powerbook battery and memory" to locate this article.

In general, any PowerBook battery except the lead acid battery used by the PowerBook 100 can experience battery memory. Battery memory describes a condition where a battery is only partially discharged, then recharged. Over

time, the battery can reach a point where the perceived capacity of the battery is that level to which it has been draining to. If the battery is fully drained periodically, this effect can be minimized or eliminated.

There are third-party external battery rechargers that perform a deep discharge of the PowerBook battery as a prelude to charging. There are also a variety of software utilities made by Apple and third-party companies that will automatically fully discharge and recharge the battery.

6) Question: I recently purchased a Type 3 battery for my PowerBook Duo 230. The battery works fine in my PowerBook, but a red light appears on my external battery recharger when I insert the battery. The recharger works fine with the battery that came with my PowerBook. What could be wrong?

Answer: First, check the model number on the bottom of your battery recharger. A recharger with a model number of M7778 will only charge Type 1 batteries. A recharger with a model number of M1812 will charge Type 1, 2 or 3 batteries, but may need to be updated to use a Type 3 battery.

To update your battery recharger for a Type 3 battery, follow these steps:

If a red light appears when you place a Type 3 battery into the recharger, the recharger is either the older model or the recharger needs to be updated.

If you have a recharger model M1812 and you need to update it, follow these steps:

Step 1

Shut down the PowerBook Duo computer, make sure the Type 3 battery and any necessary software has been installed. If you're running System 7.5.1 the Type III Battery extension must be installed.

Step 2

Plug the power adapter into an AC outlet using the power cord that came with the computer.

Step 3

Snap the recharger onto the side of the power adapter.

Step 4

Plug the power adapter cable into the power adapter port on the back of the Duo computer.

Step 5

Turn on the PowerBook Duo to download the update to the charger.

7) Question: It is my understanding that Apple no longer sells the PowerBook 100 battery. What can I do when my faithful PowerBook 100 needs a new battery?

Answer: Apple continues to make PowerBook 100 batteries available as a service part and any Apple-authorized service provider can order it. The service part number for a PowerBook 100 battery is 661-0782. Additionally, a number of third-party companies make batteries for the PowerBook 100.

8) Question: I recently purchased a new battery for my 500 series PowerBook. My PowerBook isn't charging/recognizing this battery. What should I do?

Answer: Try running the Intelligent Battery Update on your battery. This will update and fix the battery if needed, or let you know that the battery needs to be replaced. The Intelligent Battery Update can be found at the path Apple Software Updates -> Macintosh -> System Software -> Other System Software.

If the Intelligent Battery Update does not alleviate the symptoms, try resetting the power manager on the PowerBook by following these steps:

Step 1

Shut down the PowerBook using the Special menu.

Step 2

Press the Command-Option-Control-Power On keys simultaneously and let go. Pressing the keys will not appear to do anything.

Step 3

Press the Power On key to start up the PowerBook. Your brightness and contrast settings may be reset and you may need to adjust them in order to see the screen.

If the symptom is still not resolved, the battery may need replacement. You can contact the Apple Assistance Center at 800-SOS-APPL (800-767-2775) or contact the Apple Referral Center at 800-538-9696 to obtain a phone number for an Apple-authorized service provider in your area.

9) Question: How long can I store my PowerBook battery?

Answer: Apple uses three different types of batteries in the PowerBook series of computers. All 100 series PowerBook computers, save the 100, use a Nickel Cadmium (NiCad) battery. The PowerBook 100 uses a lead acid battery. Both 200 and 500 series PowerBook computers use a Nickel Metal Hydride (NiHy) battery.

A lead acid battery should retain the minimal charge needed to operate a PowerBook 100 for at least 3 months. Once a lead acid battery becomes fully discharged, it may experience sulfation. Sulfation occurs when the lead electrodes inside the battery convert to lead sulfate. This destroys the battery making it unable to hold a charge.

A NiCad battery should retain the minimal charge needed to operate a 100 series PowerBook for at least 2 months. A NiCad battery stored for 6 to 12 months should still be able to accept a charge.

A NiHy battery should retain the minimal charge needed to operate a 200 or 500 series PowerBook for at least 2 months. A NiHy battery stored for 6 to 12 months should still be able to accept a charge. In the case of the Intelligent Battery used by the PowerBook 500 series, the Intelligent Battery Recondition software is often needed to revive a battery that has discharged fully while in storage.

The environmental temperature will affect the storage life of any battery - cool environments are best.

10) Question: My PowerBook will not start off battery at all. Should I just buy a new battery, or is there something else I can do?

Answer: Generally when a PowerBook battery goes bad, it provides less operating life over a period of time. If your PowerBook suddenly will not work with its battery at all, this could be an issue with the battery itself, or the logic board of your PowerBook. If possible, try your battery with another PowerBook, or try a verified-good battery in your PowerBook to help isolate the issue.

If you are not in a position to try a known good battery or verify your own battery with another PowerBook, there are still some steps you can take. First, reset the power manager of your PowerBook. Instructions for resetting the power manager on various model PowerBook computers are available in this document or at the online Technical Information Library. Use the search string "power manager and reset" to locate the article "PowerBook: Resetting Power Manager." Charge the battery overnight following this reset.

If your PowerBook still will no longer work with its battery after this process, you should seek service. Contact your local Apple-authorized service provider, or call 800-767-2775 for further assistance.

11) Question: How can I increase my PowerBook computer's battery life?

Answer: The two operations of your portable computer that drain the battery the most are using the backlight on your screen and using your hard drive. To increase battery life reduce these two factors. Set your hard drive to spin down quickly and turn off your backlight or sleep the machine when not in use. In addition, turning on processor cycling or using the slower processor speed available on some models will increase your battery life. These options are available in the PowerBook control panel.

Some steps to reduce hard drive usage are disconnecting any external peripherals, removing PC (PCMCIA) cards, increasing your disk cache in the Memory control panel, increasing the memory allowance for programs, and running frequently used programs off a ram disk, esp. if they are disk intensive.

For more information on this subject read the Tech Info Library article titled,

"PowerBook: Power and Battery Saving Tips".

12) Question: What is processor cycling and how do I turn it off?

Answer: All PowerBook models except those using the PowerPC processor implement a feature called processor cycling (formerly known as processor rest) intended to save battery life. This feature activates when the computer detects that the keyboard, mouse, trackball, or Trackpad has not been used for more than a few seconds. At this time, the processor speed is reduced to about 3 MHz and all processing functions become extremely slow. Processor cycling will not activate while the computer is doing any sort of data transfer.

Note that by default processor cycling is on, and although it is intended to for battery life conservation, it will also activate while running off AC power.

The method of turning off processor cycling will depend on the version of the system software you are using:

System 7.0.1
=====

Step 1

Open the Portable control panel.

Step 2

While holding down the Option key, click on the word "Minutes".

Step 3

Select Don't Rest and click OK.

System 7.1
=====

Step 1

Open the PowerBook control panel.

Step 2

While holding down the Option key on the keyboard, click the Options... button in the control panel.

Step 3

Select "Don't allow cycling".

System 7.5 or later
=====

Step 1

Open the PowerBook control panel.

Step 2

Make sure the toggle switch in the control panel is set to Easy.

Step 3

While holding down the Option key on the keyboard, drag the toggle switch from Easy to Custom and let go.

Step 4

Uncheck the "Allow processor cycling - more battery savings" checkbox.

13) Question: Can I charge my PB from a car cigarette lighter?

Answer: Yes, there are several commercial auto adapters on the market. We have not been able to get a complete listing of the available adapters, but a trip to your local computer store, or a call to standard mail order companies should provide you with enough information.

14) Question: I am taking my PowerBook to another country, do I need a power converter?

Answer: All of the PowerBook AC "bricks" are capable of AC power specifications from around the world. To verify, there should be a line on the AC adapter stating

AUTO RANGING INPUT:100-120V~1.5A 200-240V~0.75A.

If your AC adapter has this on it, it will adjust to the proper voltage.

Note: You will need an adapter to allow you to plug your power cord into a "foreign" plug. These are available at stores such as Radio Shack.

15) Question: Can the PowerBook 5300/190 use two batteries simultaneously?

Answer: Yes, the PowerBook 5300/190 expansion bay (where the floppy disk drive normally is) can accept a battery. BTI (800-982-8284) is in the process of releasing such a battery as of this writing. Since the expansion bay does not pass AC power through, any battery used through the expansion bay will require its own power supply for charging.

16) Question: Where else can I go for answers?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Technical Information Library (TIL). This library contains thousands of technical articles which are easily searchable using boolean search strings.

This article was published in the "Information Alley":
Volume II, Issue 11, Page 15

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:

Color LaserWriter 12/600 PS: Thin Line Next to Black Area (7/95)

Revised: 7/28/95
Security: Everyone

Color LaserWriter 12/600 PS: Thin Line Next to Black Area (7/95)

Article Created: 24 July 1995
Article Reviewed/Updated: 28 July 1995

TOPIC -----

Using a Color LaserWriter 12/600 PS, I have noticed that there appears to be a thin white line next to the black imaged area. Is the black plate printing out of register?

DISCUSSION -----

This "effect" is not caused by the paper being moved within the printer. It is a result of the Color Photograde technology creating colors from patterns of dots. The pattern is more noticeable with lighter colors next to solid black. This effect will also happen when using solid cyan or solid magenta. Most users use colors that are a combination of these pigments, such as blue, which is made of 100% Cyan and 100% Magenta so this effect is not usually noticeable.

To prevent the white line from appearing, you can create black out of Magenta, Yellow, and Cyan in 100% shades. However, this increases the cost per page and produces a more charcoal colored black.

If the line appears to be more than 1/16th of an inch, try using a different paper type and selecting "Best" from the Options menu in the Print dialogue box.

Note: Other laser printers and solid wax printers will display this effect, but sublimation printers will not because they actually create continuous tone images by varying the heat applied to solid pigment.

QuickTime Conferencing: Description (8/95)

Article Created: 24 July 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

This article provides a description of QuickTime Conferencing.

DISCUSSION -----

Overview

Apple QuickTime Conferencing is a videoconferencing and collaboration solution designed as the foundation for a broad range of Apple and third-party video and document conferencing solutions.

QuickTime Conferencing is a system software extension. It includes an application that allows users of Macintosh computers to work with colleagues or customers around the corner or around the world without leaving the office.

You can share and annotate video, audio, text, images, and sound during your conferencing sessions. You can save time and money using local-area networks (LANs) such as Ethernet and Token Ring, and wide-area networks (WANs) such as ISDN and the Internet to communicate more easily and effectively. In the future IsoEthernet and Asynchronous Transfer Mode (ATM) will also be available.

QuickTime Conferencing has been designed to support open standards for interoperability. It is therefore transport-, compression-, and media-device-independent. And it provides a consistent cross-platform standard for developers that will encourage the creation of consistent user interfaces across platforms, services, and products.

Why choose QuickTime Conferencing?

- It's easy. QuickTime Conferencing is easy to set up and use. It integrates hardware, software, and network capabilities already available on your computer, allowing you to begin collaboration in a matter

of minutes.

It supports open standards for interoperability between various computer platforms. This allows you to communicate with another user at their video-ready desktop or meeting room.

QuickTime Conferencing also takes advantage of today's Apple products such as QuickTime and PowerTalk software, and will work with future Apple technologies such as OpenDoc.

- It costs less. QuickTime Conferencing takes advantage of built-in Macintosh audio/video (AV) capabilities and the advanced processing power of the PowerPC microprocessors built into Power Macintosh computers.

With Apple Macintosh AV technologies, you can connect a video camera and microphone (and external speakers, if you wish) directly to your Macintosh, without adding any special cards. And many Macintosh models and monitors include built-in speakers and microphones, making setup even easier.

With non-AV Macintosh models, QuickTime Conferencing will work with a variety of currently-available third-party video cards.

All these built-in technologies allow Apple and third-party developer partners to provide personal videoconferencing solutions at a low cost to customers.

This makes QuickTime Conferencing a videoconferencing solution that can be deployed affordably, quickly, and easily throughout large organizations.

- It's scalable. QuickTime Conferencing is extensible and scalable. It supports a range of solutions, from inexpensive software-only configurations to high-performance dedicated systems.

You pick the price/performance you desire. QuickTime Conferencing works best with Power Macintosh AV computers, but also works with Macintosh and PowerBook computers.

- It meets international and industry standards. And will establish new ones. QuickTime Conferencing supports both existing and emerging international (ITU-T) videoconferencing and networking standards.

Cross-platform support

- It supports the worldwide H.320 teleconferencing standard over ISDN (in conjunction with the Meet-Me product from SAT), providing connectivity solutions to other H.320 systems on Macintosh, IBM-PC-compatible, and UNIX systems, as well as room-based systems.

- It works with existing local and wide area networks including Ethernet, Token Ring, and ISDN and network protocols including AppleTalk and TCP/IP.

- Its software architecture supports emerging network technologies including IsoEthernet and ATM.

..TIL18245-QuickTime_Conferencing-Description_8-95.pdf

- It supports a variety of connection models including point-to-point videotelephony, multiparty videoconferencing, broadcast audio and video on a local area network, as well as audio-only or video-only for special applications.

Video format and compression support

- QuickTime Conferencing is compatible with a range of video input formats including NTSC, PAL, and SECAM, in both composite and S-video modes.
- It's also compatible with software- and hardware-based video compression standards including H.261 and JPEG, as well as Apple Video, and Indeo.

System requirements

=====

Hardware and software requirements

- Any 68040-based Macintosh; Power Macintosh; or PowerBook 520, 520c, 540, or 540c computer with at least 8 megabytes of memory (16 megabytes recommended), running system software version 7.1 or later.

Network requirements

- A network interface such as Ethernet, IsoEthernet, Token Ring, ISDN, FDDI, or ATM

Recommended hardware

- Power Macintosh AV or Macintosh AV computers allow digitizing of live video and capture and of live audio.
- For non-AV Power Macintosh and Macintosh computers, video digitizers and video sources (with appropriate driver software) enable the capture of live video.
- A sound digitizer allows the capture of audio.

Recommended software

- The QuickTime Conferencing system software extension works with System 7.5 features including Drag and Drop, WindowShade, and PowerTalk. And the QuickTime Conferencing application uses the System 7.5 feature, Apple Guide, which is an interactive help and learning system.
- QuickTime Conferencing works with the System 7.5 feature MacTCP for calling other users via TCP/IP.
- The System 7.5 feature PowerTalk allows universal network browsing and calling QuickTime Conferencing users via PowerTalk information cards.

QuickTime Conferencing: Read Me (12/95)

Revised: 12/8/95
Security: Everyone

QuickTime Conferencing: Read Me (12/95)

=====

Article Created: 24 July 1995
Article Reviewed/Updated: 8 December 1995

TOPIC -----

This article contains the ReadMe file included with the QuickTime Conferencing software.

DISCUSSION -----

QuickTime Conferencing

Introduction
=====

The QuickTime Conferencing folder/disks contain video conferencing and collaboration software you can install on your computer.

QuickTime Conferencing is a system software extension. It comes with Apple Media Conference, an application program you use to set up video conferences, collaborate with others, exchange live video and sound, and share information over a network. Apple Media Conference takes advantage of the networking capability already built into your computer so you can connect with other video conferencing systems over a local or wide area network, such as an AppleTalk local area network or the TCP/IP Internet.

The instructions below explain how to install and use QuickTime Conferencing and Apple Media Conference. To print these instructions, choose Print from the File menu, and click the Print button in the dialog box that appears.

System Requirements
=====

- Quadra 660AV or 840AV, Power Macintosh AV computer, or Power Macintosh computer with AV card upgrade

- System software version 7.5 or newer
- 16 megabytes of DRAM (memory)
- Video source (for instance, a video camera or VCR)
- Audio source (for instance, a PlainTalk microphone or VCR)
- Network connection (for instance, Ethernet or ISDN)
- Network Software Installer version 1.5 or newer.

Note: QuickTime Conferencing supports Apple built-in video. Apple cannot guarantee compatibility with third-party video input cards.

Installing QuickTime Conferencing Software =====

Follow these steps to install the QuickTime Conferencing software.

Step 1

Locate the QuickTime Conferencing Install folder and open it. Double-click the Installer icon located in the folder.

Step 2

Read the message that appears, then click Continue.

Step 3

In the Easy Install dialog box, click Install. All the necessary software will be installed on your computer's hard disk.

Step 4

When installation is complete, click Restart.

Opening Apple Media Conference =====

After QuickTime Conferencing has been successfully installed, you will find the Apple Media Conference program in a folder named QuickTime Conferencing, located on your hard disk. (If you have more than one disk, the folder is located on the disk you specified in the Easy Install dialog box.) To open Apple Media Conference, double-click its icon.

When you start Apple Media Conference for the first time, you'll see a message asking if you want to go directly to Apple Media Conference Guide, an Apple Guide online help system.

Click the Guide button to see instructions that lead you through setting up your equipment and network. These instructions are part of Apple Media Conference Guide, a complete online reference to answer any questions you may have about Apple Media Conference.

Getting Help and Information

=====

Apple Media Conference Guide answers common questions about setting up and using Apple Media Conference. When you need help or instructions, choose Apple Media Conference Guide from the Guide menu (at the upper-right-corner of your screen) while you are using Apple Media Conference.

For detailed troubleshooting information, and tips on improving the performance of Apple Media Conference, refer to the Troubleshooting topic in Apple Media Conference Guide.

For general Macintosh help, go to the Finder by clicking anywhere on the desktop (the background area on your screen). Then open the Guide menu and choose Macintosh Guide.

For Power Macintosh 5200 LC and 5300 LC Users

Users of the Power Macintosh 5200 LC and 5300 LC series computers should note the following:

- Sound compression and sound sample rate

Sound compression is not available if the selected sound sample rate is 11.127 kHz. Sound compression is available if the selected sound sample rate is 22.255 kHz. The sound compression and sound sample rate settings are found in Sound Settings under the Settings menu. For example, if the sound sample rate is set to 22.225 kHz and you wish to change it to 11.127 kHz you must make sure the sound compression is set to "None" or you will not be able to select 11.127 kHz.

- Large window sizes and low memory problems

You may encounter memory problems when using double size windows for the self view and remote view. Increasing the amount of application memory for Apple Media Conference from 3,000 kbytes to 4,000 kbytes will solve this problem. A description of changing the amount of memory for Apple Media Conference is described below in the Troubleshooting section of this document.

- PPCPlayThru extension conflict

If the PPCPlayThru extension is present in the Extensions folder of the System Folder the volume control in Apple Media Conference will not operate properly. Removing the PPCPlayThru extension will correct the problem.

- For At Ease 3.0 and At Ease Workgroups 2.0.3 Users

For QuickTime Conferencing to operate properly certain conditions under At Ease must be set properly.

- If the user is restricted to At Ease Panels, Apple Media Conference and MoviePlayer must be enabled under "Items for this User."

- File open and save privileges must be enabled under the "Security" setup.

Both the user's folder and/or floppy should be set for these privileges. The user should also be allowed to perform screen captures.

- Apple Media Conference will not save preference settings based on individual users. Each individual user should check to make sure the settings are appropriate for their conferencing needs. To change the name of the user in Apple Media Conference choose Preferences/Conference from the Settings menu. Type your name in the user name box.

- Drag and Drop onto the desktop does not operate in the At Ease Panels level.

- You cannot share movies or sounds in the Shared Window in Apple Media Conference.

Troubleshooting =====

Apple Media Conference Guide contains more detailed information about the problems listed here, and other problems you may encounter.

- You see low memory warnings while using Apple Media Conference
Increase the amount of memory allocated for the Apple Media Conference program. To do this, quit Apple Media Conference, go to the Finder, click the Apple Media Conference program icon, choose Get Info from the File menu, and increase the value in the Preferred Size box. For more detailed instructions on increasing the memory allocated to a program, go to the Finder, open the Guide menu located in the upper-right-corner of your screen, choose Macintosh Guide, click the Topics button, click the Memory topic area, and double-click the "change a program's memory size" phrase.

- You see an error message when you plug or unplug video or audio cables during a connection

Do not plug or unplug camera, microphone, or other sound and video cables while you are connected to another caller, or viewing or sending a broadcast. This can temporarily disable the QuickTime software. You should always turn off your computer before you plug or unplug any cables.

- The video image is distorted

Make sure the settings are correct in the Video Settings dialog box. The settings should specify the video format supplied by your camera (NTSC, PAL, or SECAM). To adjust the settings, choose Video Settings from the Settings menu, choose Source from the top pop-up menu in the Video Settings dialog box, and choose the correct video format (NTSC, PAL, or SECAM) from the Format pop-up menu.

Apple Media Conference Guide contains more detailed instructions on adjusting the video (and sound) settings.

If you are using a Power Macintosh 6100AV, 7100AV, or 8100AV computer, attach your display to the monitor port located on the AV video card instead of the monitor port located on the computer's logic board. (Shut down the computer and turn off the power before you change your display's connection.) See the manual that came with your computer for more information.

- Calling TCP/IP Users with Dynamic Server-Based Addresses

If you are connecting using TCP/IP from a machine using a static IP address to a machine using MacIP (KIP) server supplied addresses, you must have a clear TCP/IP pathway between the Macintosh computer with the static address and the MacIP (KIP) server.

If you plan to use a MacIP server to allocate TCP/IP addresses, the MacIP requires a clear AppleTalk pathway from all Macintosh computers requiring an IP address to the MacIP server.

- A Note Regarding Interoperability

QuickTime Conferencing is the foundation for a broad range of Apple and third-party video and document conferencing solutions.

QuickTime Conferencing supports open standards for interoperability, so developers can use it to create software that works with a variety of network transports, compression technologies, and media devices (cameras, microphones, and so forth). QuickTime Conferencing provides consistent standards that encourage software developers to create application programs that look and act the same from a user's point of view, regardless of the computer, network service, or devices being used.

Performa: Modem Port Disabled w/Internal Modem Present (1/97)

=====

Article Created: 25 July 1995
Article Reviewed/Updated: 30 January 1997

TOPIC -----

I have noticed that the modem serial port is covered up on Macintosh Performa 5200 and 6200 series computers*. Why is this? Is it possible to uncover it and use it?

DISCUSSION -----

The Macintosh Performa 5200 and 6200 series computers have an internal Global Village IIv modem installed in the communications slot. The presence of the internal modem disables the external modem port. Because this port is inactive, it is covered.

If you need to use the external modem port, the internal modem must be removed. Instructions for installing a card into the communications slot are included in the Macintosh Performa User's Guide. You can follow these instructions for removing the internal modem as well. Although such cards are typically user-installable, you may want to contact an Apple-authorized service provider for assistance with this procedure.

Any damage caused by the addition or removal of the modem is NOT covered under the warranty.

*Note: Any Macintosh computer which has a communications slot will also have the external modem port disabled if an internal modem is installed. However, the external modem port is available if a network card is installed in the communications slot. The following computers have a communications slot:

- The Macintosh 57x family: Macintosh LC 575, Performa 575, Performa 577, Performa 578

- The Macintosh 580

- The Macintosh 630CD family: Macintosh LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640.
- The Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.
- The Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.
- The Macintosh Performa 5300CD and Power Macintosh 5300/100 LC
- The Macintosh Performa 6300CD

At Ease 3.0: PC Exchange Will Not Mount PC Disks (8/95)

Revised: 8/3/95
Security: Everyone

At Ease 3.0: PC Exchange Will Not Mount PC Disks (8/95)

=====

Article Created: 03 August 1995

TOPIC -----

I am running At Ease for Workgroups 3.0 on my Macintosh computer. When I am in the Restricted Finder and insert a PC formatted disk, the Macintosh does not recognize it as a PC formatted disk and asks to initialize it. Macintosh disks mount fine in the restricted finder.

When I switch to the normal finder, PC disks mount fine. I can give the user access to the control panels in the Restricted Finder and the Macintosh will then mount PC disks, but that defeats the purpose of At Ease.

DISCUSSION -----

If a Restricted Finder Setup does not allow the user to have access to the Control Panels, PC Exchange does not work, and the Macintosh treats the disk as a non-Macintosh formatted disk.

You can work around this by adding the PC Exchange Control Panel to the Restricted Finder Items folder. This gives the setup access to only that particular control panel. Once this control panel is put in the "Items for this Setup", PC disks mount without a problem.

Power Macintosh: Using Apple Serial NB Card (7/95)

Revised: 7/26/95
Security: Everyone

Power Macintosh: Using Apple Serial NB Card (7/95)

=====

Article Created: 26 July 1995

TOPIC -----

Can I use an Apple Serial NB card on a Power Macintosh computer? Can I use more than one Apple Serial NB card on a Power Macintosh computer?

DISCUSSION -----

The Apple Serial NB card can be used on a Power Macintosh computer. The A/ROSE extension, version 1.2.1 or later, needs to be installed. This extension comes with the Network Software Installer (NSI) 1.4.2 or later. The A/ROSE extension can also be custom installed from the System Software installer, version 7.1.2 or later.

Only one Apple Serial NB card can be used on a Power Macintosh computer since Power Macintosh computers allow only one NuBus card to be a bus master. Because of this, it is not possible to have more than one Apple Serial NB Card installed in a Power Macintosh system.

CPU Energy Saver: ReadMe File (7/95)

Revised: 7/26/95
Security: Everyone

CPU Energy Saver: ReadMe File (7/95)

=====

Article Created: 26 July 1995

TOPIC -----

This is the Read Me file included with the CPU Energy Saver 1.0.6 software.

DISCUSSION -----

CPU Energy Saver Read Me
Version 1.0.6

The CPU Energy Saver control panel allows you to set your computer to shut down automatically.

- You can set your computer to shut down automatically when the computer has been idle for a specified amount of time.
- You can set your computer to shut down at a specific time of day on one or more days of the week. CPU Energy Saver notifies you several minutes before it shuts down the computer. You can specify the notification time.
- You can specify the conditions under which CPU Energy Saver does not shut down the computer, including any or all of the following:
 - You're connected to a shared disk on the network.
 - A serial port is in use by a telecommunications program or a printer.
 - A "busy" pointer (that is, a watch) is on the screen.
 - A sound is playing.

SYSTEM REQUIREMENTS

CPU Energy Saver works with all Macintosh Quadras, Power Macintoshes and upgrade cards and requires system software version 7.1 or later.

NOTE:

The original Read Me file does not note all of the incompatibilities for the

software. The CPU Energy Saver is not compatible with the Quadra 605, Centris/Quadra 610, Centris/Quadra 660AV, Performa 6100-series, Power Macintosh 6100-series and the Power Macintosh 9500-series computers. Please refer to the article titled "Energy Saving Control Panels: Description and Compatibility" for more details.

INSTALLING CPU ENERGY SAVER SOFTWARE

1. Drag CPU Energy Saver to the System Folder icon on your startup disk.
2. Click OK in the dialog box that appears.
3. Choose "Restart" from the Special menu.

COMPATIBILITY AND USE NOTES

If you have the NOW Utilities software on your system, make sure the Screen Locker component loads before CPU Energy Saver when you turn on the system. Otherwise, Screen Locker and CPU Energy Saver are incompatible. Use Startup Manager (included in NOW Utilities) to set Screen Locker to load before CPU Energy Saver.

CPU Energy Saver cannot shut down a monitor that is not plugged into the computer's power supply. Also, it cannot shut down external devices, such as hard disks or CD-ROM drives.

CPU Energy Saver may not be able to detect special "busy" pointers used by some programs.

Some screen savers may interfere with CPU Energy Saver's shutdown notification window.

In most cases, CPU Energy Saver cannot shut down your computer if a dialog box is on the screen.

CPU Energy Saver cannot determine whether the computer is doing something in the background (such as printing). However, you can set CPU Energy Saver not to shut down the computer if a serial port is being used (for printing, telecommunications, or networking, for example).

MacTCP: Configuration of Domain Name Server Information (11/95)

Revised: 11/12/96
Security: Everyone

MacTCP: Configuration of Domain Name Server Information (11/95)

Article Created: 26 July 1995
Article Reviewed/Updated: 21 November 1995

TOPIC -----

This article describes how to enter the Domain Name Server Information in the MacTCP control panel and how MacTCP uses that information to query those servers.

DISCUSSION -----

You need the following information to configure the Domain Name Server Information section of the MacTCP control panel:

Required: A list of 1 or more domain nameserver.
Optional: A default domain.

One name server configuration

=====

This configuration will send all requests to the single nameserver.

Step 1

Enter your default domain in the "domain" field.

Step 2

Enter the IP address of the nameserver in the "IP address" field.

Step 3

Click the default button.

Step 4

Enter a "." (period) for the second "domain" field.

Step 5

Enter the IP address of the nameserver in the "IP address" field.

The result should contain two entries for the same nameserver, and look like:

Domain	IP Address	Default	
<default domain>	<IP number>	(•)	<- click default radio button
.	<IP number>	()	<- type a period for domain

Two or more nameserver configuration

=====

Follow the same steps for entry of the first nameserver

For each additional nameserver, enter the following information:

Step 1

Enter a "." (period) for the second "domain" field.

Step 2

Enter the IP address of the nameserver in the "IP address" field.

Thus, the first nameserver is entered twice, and each additional nameserver is entered once.

Domain	IP Address	Default	
<default domain>	<Primary IP#>	(•)	<- click default radio button
.	<Primary IP#>	()	<- type a period for domain
.	<Secondary IP#>	()	<- type a period for domain

If you use the configuration mentioned above, MacTCP will generally ask the primary nameserver first. It will also always ask the other nameserver if the first nameserver is down or unavailable.

How MacTCP queries nameservers

=====

The actual rules MacTCP uses to establish query order in DNS are somewhat complicated. The Domain Name Server Information list functions as a list of nameservers and their trusted domain. For example:

```
apple.com      1.2.3.4
info.apple.com 5.6.7.8
microsoft.com  9.10.11.12
```

A nameserver 1.2.3.4 is trusted for any hostnames that exist in apple.com.

A nameserver 5.6.7.8 is trusted for any hostnames that exist in info.apple.com.

A nameserver 9.10.11.12 is trusted for any hostnames that exist inside

microsoft.com.

When MacTCP DNR is given a hostname, it uses a 3 step process to ask nameservers for the matching IP address:

1. Build list of trusted nameservers.

When MacTCP DNR is given a hostname, it compares each nameserver's domain to the hostname. If the hostname appears within the trusted domain of the nameserver, the nameserver is put in the list of nameservers to query.

If no nameservers are trusted for a host, then the nameserver listed by the "default" radio button will be asked as a last resort.

Note: The default radio button has two functions in MacTCP:

- The "IP address" field provides the nameserver of last resort, if no other nameservers are trusted.
- The "domain" field provides the default domain added onto single hostnames.

For example, if you tried to connect to "www.info.apple.com", the "info.apple.com" and "apple.com" nameservers are considered trusted. The "microsoft.com" nameserver cannot be trusted, because "www.info.apple.com" is not a name within "microsoft.com"

Note: This is why nameservers should be entered with their domain as "dot" (period) because you are telling MacTCP that nameserver is trusted for the entire Internet.

2. Sort nameservers for search order.

MacTCP will ask the query the nameservers with longer trusted domains first. If two nameservers are trusted for the same domain, any nameservers on the local network will be queried first.

Continuing the example, the "info.apple.com" server is considered "closer" to "www.info.apple.com" than "apple.com". MacTCP will ask "info.apple.com" and then "apple.com".

3. Resolves names (give nameserver hostname, receive IP address in return).

MacTCP asks each nameserver for the IP number of the hostname one at a time. When one nameserver failes to resolve or time out, MacTCP moves to the next nameserver. If MacTCP runs out of nameservers, it will return an error unless the hosts file can provide information.

Color LaserWriter 12/600 PS: PANTONE Files Read Me (7/95)

Revised: 7/27/95
Security: Everyone

Color LaserWriter 12/600 PS: PANTONE Files Read Me (7/95)

=====

Article Created: 27 July 1995

TOPIC -----

The following article is the Read Me document for the PANTONE Calibrated Support files for the Color LaserWriter 12/600 PS printer.

DISCUSSION -----

Overview

=====

The PANTONE support files enable you to load the PANTONE color table calibrated for your Apple Color LaserWriter 12/600 PS printer as a usable color palette in the most popular Pantone-licensed desktop publishing programs.

Custom CMYK combinations for almost every color in the PANTONE MATCHING SYSTEM can be selected. The only exceptions are specialty colors such as metallics, fluorescents and double impressions. For best results, be sure to use papers recommended in the printer manual.

Note: The tables and palette files provided for the Apple Color LaserWriter 12/600 PS printer are calibrated only for this printer. If you plan to create color separations, you must re-color the graphics using the built-in PANTONE color tables supplied by the PANTONE-licensed application.

Installation on a Macintosh

=====

Follow the instructions below to install the files in the PANTONE Color Charts folder. For the files in the Application Support folder, see the installation instructions for each application provided in this document in the Application Support section.

Installing and Printing the Color Charts on a Macintosh

Installing the Color Charts requires about 1.7 megabytes of hard disk space. To install the Color Charts, first open the PANTONE Color Charts folder. Then, double-click on the ColorCharts.sea file. Press Continue. The self-extracting archive application asks you for the volume and folder name that you want to use. By default the application uses the current hard disk and the folder "ColorCharts Folder". When you've selected the hard disk and the name you want to use, press the Save button. The files are decompressed. When finished the self-extracting archive application displays the message "Installation was successful!". Press Quit.

Printing the Color Charts on a Macintosh

Four versions of the Color Chart are available:

- PostScript file
- Adobe Acrobat file
- Encapsulated PostScript files
- TIFF files

You use the color chart for the Apple Color LaserWriter 12/600 PS to select the PANTONE colors that you want to use. To use the color chart, you first print it on the Apple Color LaserWriter 12/600 PS. Be sure to allow enough time to print the chart; it takes about forty-five minutes to print the complete chart.

Printing the PostScript Version of the Color Chart

Follow these steps to print the PostScript version of the Color Chart:

1. To print the PostScript version of the Color Chart, you use the Apple Printer Utility that came with your Apple Color LaserWriter 12/600 PS. Double-click the Apple Printer Utility icon located in the Apple LaserWriter Software folder to open it.
2. In the dialog box that appears, select the Apple Color LaserWriter 12/600 PS on which you want to print the color chart and press Open Printer.
3. Choose Send PostScript File from the utility's File menu.
4. In the dialog box that appears, select the color chart file, Clr LW 12/600.ps, located in the Raw PostScript folder.
5. Click Add
6. Click Send. The chart is printed on the selected printer.

Printing the Adobe Acrobat Version of the Color Chart

If you have Adobe Acrobat Reader, you can use it to print all or part of the color chart for the Apple Color LaserWriter 12/600 PS. Make sure that you have selected the desired Apple Color LaserWriter 12/600 PS printer in the Chooser first. Next, double-click the Apple Color LaserWriter.pdf file in the Adobe Acrobat folder in the ColorChart Folder. Adobe Acrobat Exchange opens the color chart. With this chart, you can print all PANTONE Colors calibrated for your printer (or print a range of pages if you don't need them all). It takes approximately forty-five minutes to print all pages.

Printing the Encapsulated PostScript Version of the Color Chart

If you have an application that uses encapsulated PostScript, you can use it to

print the Color Chart for the Apple Color LaserWriter 12/600 PS. Make sure that you have selected the desired Apple Color LaserWriter 12/600 PS printer in the Chooser first. Double-click on your application and then Open the desired file in the 11x17 Charts as EPSF folder. The suffix of each file corresponds to the range of PANTONE colors contained in the file.

Printing the TIFF Version of the Color Chart

If you have an application that can read TIFF files, such as Adobe Photoshop 3.0, you can use it to print the TIFF version of the Color Chart for the Apple Color LaserWriter 12/600 PS. Make sure that you have selected the desired Apple Color LaserWriter 12/600 PS printer in the Chooser first. Run your application and then Open the desired file in the Tiff folder within the ColorCharts Folder. You may need to reduce the size of the image before printing to the Apple Color LaserWriter 12/600 PS.

The files are named with the pages where you can find the PANTONE colors in the PANTONE Process Color Imaging Guide. For example, a file named "1-11.tif" includes PANTONE colors which appear on pages 1 through 11 in the PANTONE Process Color Imaging Guide. This book is a fan guide, displaying side-by-side color squares: one square being the solid PANTONE Color and another representing the way that color prints as a process (CMYK) color. The PANTONE Process Color Imaging Guide does not come with the PANTONE® Calibrated support files; it is purchased separately.

Note: These TIFF files can be used in any image processing software that supports CMYK TIFF and CMYK image editions.

Caution: Do not convert these images to RGB. If you do, the colors will not print properly.

Extras

=====

Two additional files are included on the PANTONE disk. First, the file labeled Clr LW 12/600.lut is an Excel spreadsheet containing each PANTONE color's cmyk values. You can optionally use this as an aid in creating cmyk separations. The second file, contained within the PANTONE ColorDrive Support folder, is a color palette for the Color LaserWriter 12/600 PS for PANTONE's ColorDrive application available separately from PANTONE.

Application Support

=====

This section explains how to load calibrated palettes for the Apple Color LaserWriter 12/600 PS printer into Pantone-licensed applications. These instructions assume you are thoroughly familiar with the correct operation and usage of the given software application.

Adobe Illustrator

The PANTONE® Calibrated support files include a color file that is similar to the standard PANTONE Colors file included with Illustrator, except that the CMYK values are calibrated for the Apple Color LaserWriter 12/600 PS printer. This file, Clr LW 12/600.ai, is located within the Illustrator folder within the

Adobe folder located in the Application Support folder.

To use the file follow these instructions. Open Illustrator 5.0, and then, use Open from the File menu to open the Clr LW 12/600.ai file. Once the file is loaded, select the Show Paint Style item from the Windows menu. The Paint Style floating window appears. Click the solid color button. The named color list then appears in the scrolling window. Scroll down until you see the PANTONE Colors appear with a "CH" suffix. This suffix distinguishes these colors from the default PANTONE Colors in Illustrator which have a "CV" suffix. You may now apply these colors to your document.

In older versions of Adobe Illustrator, you may select the calibrated PANTONE Colors through the Paint Style and Custom Color dialog boxes.

Adobe Photoshop 3.0

You can use the TIFF version of the Apple Color LaserWriter 12/600 color chart to select PANTONE colors within Photoshop. The TIFF version of the color chart is a set of files located in the Tiff folder within the ColorCharts Folder. Open the desired TIFF file from Photoshop's File menu and use the Eyedropper tool to select each PANTONE color.

Alternatively, you can use the Clr LW 12/600.aco swatch file from within Photoshop to select the desired PANTONE color.

First, move the Clr LW 12/600.aco file to the Color Palettes folder in the Goodies folder in the Photoshop folder. Next, open Photoshop. To use the swatch file, select Palettes from the Window menu; then, select Show Swatches. The swatches dialog appears. Press the arrow on the right to display the available swatch files. Select the Clr LW 12/600. Use the Eyedropper tool to select the desired PANTONE color.

Aldus FreeHand 3.1

For users of FreeHand 3.1, PANTONE color support provides a calibrated PANTONE Color Palette in the form of a loadable color library. Select the Colors menu item from the View Windows menu.

The Colors window appears. Click the arrow on the right-hand side of the Colors window and select "Import." Find and open the file "Apple Color Laser.clib". Select the PANTONE Colors from the scrolling list. (To select multiple colors, hold down the shift key.) The calibrated PANTONE colors you selected now appear in the Colors window. You may now apply them to your document.

Macromedia FreeHand 4.0/5.0

These instructions apply to both Freehand 4.0 and 5.0. Move the file named Apple Color Laser.ACF in the FreeHand folder to the Color Folder in the Aldus Folder inside the System Folder.

Open FreeHand. Create a new FreeHand document. Select Color List from the Window menu. The Color list window appears. Pull down under Options and then select the Apple Color Laser palette. The library of colors for the Apple Color LaserWriter

12/600 PS appears. Choose a desired PANTONE color and click OK.

You can use the Color Mixer item within FreeHand to identify the CMYK values for a particular PANTONE color. Choose Color Mixer from the Window menu. The Color Mixer window appears. Drag the desired PANTONE color from the library of colors for the Apple Color LaserWriter 12/600 PS into the Color Mixer box, and the CMYK values for that particular color will appear.

Aldus PageMaker 5.0

PageMaker uses the same color file as FreeHand 4.0 and 5.0.

Move the file named Clr LW 12/600.BCF in the Pagemaker folder to the Color Folder in the Aldus Folder inside the System Folder.

Open PageMaker 5.0. Select the Define Colors item from the Element Menu. On the Define Colors dialog box click the New... button. In the Edit Color dialog box that appears click on the Libraries: arrow button and select the Apple Color Laser item that appears in the hierarchical list. The library of colors for the Apple Color LaserWriter 12/600 PS appears. Holding down the shift key, click on the PANTONE colors you want to add to your working colors palette and click OK. The colors you selected will now appear in your Define colors list. You can now use these in your PageMaker documents.

Canvas

PANTONE color support provides a special palette for Canvas named Clr LW 12/600.Canvas.

To load the palette, in Canvas, choose PANTONE Colors from the Windows menu. The PANTONE Colors dialog appears. Choose Load... from the Color Sets pop-up menu. Enter the name of the Apple Color Laser palette. These colors may now be used in your artwork.

MacDraw Pro

First, move the Apple Color LW 12/600 file from the floppy's MacDraw Pro folder to the PANTONE® Palettes folder in the MacDraw Pro folder on your hard disk.

To use the new color palette follow these steps:

1. Open MacDraw Pro or double-click on your MacDraw Pro document.
2. Tear off the Color palettes floating window from the blend icon.
3. Choose Open Palette from the Color palette's File menu.
4. Then open the MacDrawPro palette provided.

Note: This palette may work with other Claris products. Since PANTONE does not support these products, do not use the Apple Color Laser palette for separations.

Quark XPress 3.3x

As Quark XPress does not support loadable palettes except as part of a document,

PANTONE color support provides Quark XPress 3.3 native files instead. The maximum number of colors in each Quark document is 200. PANTONE provides a series of files each containing a range of PANTONE colors. The file name contains the PANTONE color range contained in each file. For example, a file named PANTONE 100-249 contains PANTONE colors from PANTONE 100 to PANTONE 249.

To use these files, use Open from the Quark Express File menu to open the desired palette file.

Note: The PANTONE names in the Quark XPress Apple Color Laser palettes have a space character in front of PANTONE. Do not rename these colors without the space or Quark will re-map its default CMYK color values for PANTONE colors into your calibrated PANTONE Colors for the Apple Color LaserWriter 12/600 PS.

PC Exchange: Reason for Versions 2.0.4 and 2.0.5 (8/96)

Revised: 8/15/96
Security: Everyone

PC Exchange: Reason for Versions 2.0.4 and 2.0.5 (8/96)

Article Created: 27 July 1995
Article Reviewed/Updated: 15 August 1996

TOPIC -----

This article describes the changes made to the PC Exchange control panel, including compatibility.

DISCUSSION -----

Macintosh PC Exchange 2.0 has been updated slightly to correct for a minor bug encountered during testing of the Power Macintosh 7200, 7500, 8500, and 9500 computers.

Here are the changes that are included with PC Exchange 2.0.4 and 2.0.5. These versions are specifically for the Power Macintosh 7200, 7500, 8500, and 9500 computers.

Software Version 2.0.4

- Included on Power Macintosh 9500 computers*
- It fixed a stack overflow in the PC Exchange ProDOS component that was caused by the new native driver model. PPC code needs more stack space and used up the 8K that ProDOS allocated for itself when doing large copies.

Software Version 2.0.5

- Included on Power Macintosh 7200, 7500, 8500, and 9500 computers*
- Includes the above fix
- Fixed a deadlock condition caused by the change in how the Finder copied files to and from ProDOS disks. The Finder now does async copies and the PC Exchange ProDOS component would issue a sync read during a "completionProc" call causing a deadlock. The change does away with the calls to the driver to do reads and

use FSM's CacheUtil routines.

These issues may occur when a customer uses a ProDOS disk on one of the aforementioned computers. These issues do not occur when working with DOS disks.

* The Power Macintosh 9500 originally shipped with PC Exchange 2.0.4 installed. System 7.5.3 Revision 2 includes PC Exchange 2.0.5 and it is supported on all Macintosh computers running System 7.5.x.

OpenDoc: Overview (7/96)

Revised: 7/25/96
Security: Everyone

OpenDoc: Overview (7/96)

=====
Article Created: 1 August 1995
Article Reviewed/Updated: 25 July 1996

TOPIC -----

This article includes excerpts from "OpenDoc for Macintosh -- An Overview for Developers".

DISCUSSION -----

OpenDoc is a cross-platform software architecture that enables the development of component software. Component software is a term used to describe reusable, compatible building blocks of code that work seamlessly with applications--called "part editors"--from different vendors. OpenDoc consists of five functional layers:

- Compound Document Services
- Component Services
- Automation Services
- Object Management Services
- Interoperability Services

These technologies are being licensed to CI Labs, an organization established to provide open access to OpenDoc source code and specifications. CI Labs is responsible for adopting, licensing, validating, and promoting essential OpenDoc technologies. By providing reference source code for these foundation technologies, CI Labs facilitates the adoption of a common component software architecture across all major industry platforms. CI Labs also provides developers and system vendors with test suites and a conformance validation process, to ensure that software enabled by OpenDoc interoperates properly. OpenDoc will be available for Macintosh, Windows, OS/2, and UNIX systems.

OpenDoc Terminology
=====

Document

A collection of OpenDoc parts, assembled by a user or developer. A part becomes a document if dragged from its document to the desktop. A document becomes a part if dragged from the desktop into an open document.

Part

The fundamental building block of an OpenDoc document. This is the content that users see in their documents. The functionality in the associated part editor or part service allows the user to manipulate the part. Part viewers allow the user to view, but not edit, the part.

Container Application

A monolithic application that has been modified to support embedded OpenDoc part editors and part services.

Part Editor

A part editor displays a part's content, facilitates manipulation of the content, and provides a user interface for modifying that content. This user interface may include menus, controls, tool palettes, rulers, and other modes of interaction. (For example, a text editor is a part editor.)

Part Service

A part service provides "back-ground" functionality for a part, and provides the necessary user interface for manipulating that part's content. For instance, database access functionality would be a part service that could be added to an OpenDoc document. Its user interface could be a menu item or a database query screen.

Part Viewer

A part viewer offers a subset of a part editor's functionality; it allows users to display and print a part's content, but not to edit it. Viewers can be useful in document--sharing situations--for example, when the recipient of a document doesn't hold a license to some of the kinds of parts included in the document, or when the person sending the document doesn't want the recipient to alter it.

How OpenDoc Works

=====

By enabling users to work in a task-centric rather than an application-centric manner, OpenDoc makes it easier for them to create and edit content-rich documents. With OpenDoc, users can purchase or build a "container" document that includes all the functionality needed to complete a task. They no longer have to launch separate applications, worry about incompatible data types, and manually create links to update data. They will have the freedom to buy preassembled OpenDoc software solutions, just as they buy application suites today, or they can mix and match part editors from a variety of vendors to suit their specific

needs. No matter where the part editors are obtained, the user will be able to focus on a single solution that contains all needed functionality.

The OpenDoc model also improves upon the current drag-and-drop method of manipulating data. For example, a user can drag a desktop file icon into a document window, and it will automatically open and embed itself within the document. This contrasts sharply with today's way of doing things: opening one application, selecting an item to be edited and moved, copying it onto the Macintosh Clipboard, opening a second application, and then pasting the results into the window of this second application.

OpenDoc also supports irregularly shaped, overlapping parts, and the ability to have a variety of different parts active concurrently. What's more, between OpenDoc parts, data can be "linked" together. A link is a permanent reference from one part to another. When data in the first part changes, the link notifies the second part to change. Suppose, for example, a company creates an investment portfolio pie chart with a link to stock market data. Each time stock prices change, the chart adjusts accordingly. Before creating software enabled by OpenDoc, programmers will need to become familiar with some new naming conventions.

The Anatomy of an OpenDoc Document

=====

The fictional document below illustrates several unique features of OpenDoc. This oil industry report uses many OpenDoc part editors and services: a text editor, a graphics editor, a page layout editor, live buttons, a grammar checker, and a window that displays live oil commodity prices from the New York Mercantile Exchange:

Begin_Graphic

	+	-----+		Drag-and-
		THE OIL REPORT	+-----+	drop part
				services
Live data		Today's oil price:		into
feed --->		[nnnnnnn.nnn]		documents
		The History of Oil		
		Takeovers		
		Text text text text		<--- Embed
		text text text text	+-----+	buttons
		text text text text text text text text te		that link
		xt text text text text text text text text		to other
		@ text text text text text text text t		parts
Create &		/ \ ext text text text text text text		
overlap		text text text text text text te		
irregular-		/ \ / \ xt text text text text text text		
ly shaped		\ /\ text text text text text		
parts --->		/\ \ /\ \ +-----+		
		\ /\ /\ \		
		CRUDE OIL PRODUCTION		

End_Graphic

You do not need a separate application to work on each part -- just click on an area to edit it. As you click on another object, its own menu bar and tool palette appear. Parts like the live oil market commodity quotes shown in the document stay active even while others are being edited.

The ability of software enabled by OpenDoc to have multiple parts concurrently active allows the author of this newsletter to edit the crude oil production chart while the current oil prices roll across the top of the page. The editor can wrap text around the irregularly shaped oil derrick graphic part. Live buttons within the "What's Inside" field allow readers to click on a button to call up a feature article. And by dragging the "Grammar Checker" icon into the document, the part service can check grammar throughout the entire newsletter.

Macintosh 5200/5300/6200/6300: PlainTalk & 16-bit Sound (1/96)

Revised: 1/12/96
Security: Everyone

Macintosh 5200/5300/6200/6300: PlainTalk & 16-bit Sound (1/96)

Article Created: 26 July 1995
Article Reviewed/Updated: 12 January 1996

TOPIC -----

I have a Power Macintosh 5200/75 LC computer, and I am having a problem using Speech Recognition. Either it does not work well, or sometimes it doesn't work at all. I've tried using the Built-in microphone, but that doesn't seem to work well.

DISCUSSION -----

PlainTalk Speech Recognition requires 16-bit sound input in order to work properly. The recently produced versions of the Macintosh LC 5200 and Performa 5200CD and 5215CD computers support 16-bit internal sound as well as 16-bit CD sound. Early production models of Macintosh 5200 series computers support 8-bit internal sound and 16-bit CD sound. However, you can still use the Text-to-Speech feature if your computer only supports 8-bit input.

NOTE: PlainTalk 1.4.1 Speech Recognition is supported on the Macintosh 5200CD family, Macintosh 6200CD family, Macintosh 5300CD, and Macintosh 6300CD computers.

You can use the model number information below to determine whether your computer supports 8-bit or 16 bit sound. Please note that product specifications are subject to change. Check with an Apple reseller for the most current information about product specifications and configurations.

Begin_Table

Order no.	Product Name	Sound
=====		
M3947LL/A	Power Macintosh 5200 LC 8/500/CD	8-bit
M3917LL/A	Power Macintosh 5200 LC 8/500/CD/VI/TV	8-bit
M3947LL/B	Power Macintosh 5200 LC 8/500/4XCD	8-bit
M3940LL/A	Macintosh Performa 5200CD 8/500	8-bit

M3941LL/A	Macintosh Performa 5200CD 8/500/TV/VI	8-bit
M4110LL/A	Macintosh Performa 5200CD 8/790/14.4	16-bit
M4107LL/A	Macintosh Performa 5215CD 8/1000/14.4	16-bit

End_Table

If you don't know your model number, you can also use this procedure below to determine if your computer supports 16-bit sound input:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound input radio button is grayed out, you only have 8-bit input, and English Speech Recognition will not work.

If 16-bit is not grayed out, make sure there is a dot in the radio button next to it.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

For help with installing the PlainTalk 1.4.1 Speech software, see the TIL article "PlainTalk 1.4.1: Can't Install Recognition on 8-bit Mac".

The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

The following computers are in the Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Article Change History:

12 Jan 1996 - Changed title and added information on PlainTalk 1.4.1.

21 Dec 1995 - Combined information from similar article.

At Ease 3.0: How to Install on 800K Drive Macintosh (8/95)

Revised: 8/8/95
Security: Everyone

At Ease 3.0: How to Install on 800K Drive Macintosh (8/95)

=====

Article Created: 03 August 1995
Article Reviewed/Updated: 08 August 1995

TOPIC -----

I want to install At Ease 3.0 on my Macintosh computer, but it only has a 800K drive. Is there a way to get At Ease 3.0 on 800K floppy disks?

DISCUSSION -----

At Ease 3.0 and At Ease 3.0 for WorkGroups are available only on high density floppy disks. The outside of the box explains that the media is on 1.4 Mb floppy disks and an Apple SuperDrive floppy disk drive is required.

If your 800K drive equipped Macintosh computer is on a network, you can install At Ease 3.0 by doing a network install. The At Ease 3.0 for WorkGroups Administrator's Guide explains how to do this starting on page 20. You can also refer to the TIL article "Software Installation Over a Network" for a description of how to do this procedure.

Macintosh 5200/6200 Series: Stereo Input? (7/95)

Revised: 7/28/95
Security: Everyone

Macintosh 5200/6200 Series: Stereo Input? (7/95)

=====

Article Created: 28 July 1995

TOPIC -----

Is it true that the Macintosh 5200 and 6200 series computers do not support stereo input? I have been unable to record a stereo system beep and have heard that the stereo input is converted to mono by the logic board.

DISCUSSION -----

The IC chip that controls sound input on the Macintosh 5200 and 6200 series computers has one input buffer and two output buffers. Because there is only one input buffer, there is only mono sound input. Output is always stereo.

You can, however, record CD stereo sound using MoviePlayer and QuickTime. With QuickTime, the sound data is read directly from the disk. The data is then converted to a QuickTime sound format. The data is not played back through the sound circuitry; it is read from the disk. Since the sound file is not played, sound does not go through the sound IC chip which would limit input to mono sound.

Additionally, CD discs play in stereo because sound is routed from the CD player to the sound output jack and bypasses the sound chip.

Color LaserWriter 12/600: Some Color Files Print in B&W (7/95)

Revised: 7/28/95
Security: Everyone

Color LaserWriter 12/600: Some Color Files Print in B&W (7/95)

=====

Article Created: 28 July 1995

TOPIC -----

I am using a Color LaserWriter 12/600 on a Macintosh network. Some files I create display in color on the screen, but they print in black and white. Why?

DISCUSSION -----

Your Macintosh is only able to send color information to the printer if all the software for the printer is loaded and functioning properly. You should first make sure you are not experiencing any extension conflicts or corrupted software. For help doing this, search the TIL for the article "System 7.5: Troubleshooting Extension Conflicts". Once you are confident that you have good printing software installed, you can proceed to considering the following.

Color Tables are included in PostScript Level II which is built into the Laserwriter 8.3 driver as well as the ROM of the Color LaserWriter 12/600. Postscript is a computer/printer language used in imaging and Encapsulated PostScript (EPS) files. The printer also supports PICT and JPEG file formats in ROM.

TIFF Files -----

Some programs build options on top of the LaserWriter 8.3 print dialogue box. If a non-color PostScript Printer Description (PPD) file is selected, TIFF files will print in black and white because the color information in the file format is not included in the driver or the printer. You must make sure you select the Color Laserwriter 12/600 or compatible color profile. The Generic Color profile will work, but Generic Black and White will not.

The Laserwriter 8.3 Read Me recommends you use TIFF format for your files rather than EPS if you are not physically connected to a Color LaserWriter 12/600 when you create the file. This is because an EPS format creates a Table based on the type of printer in the Laserwriter 8 Prefs file and hue shifts can occur when

printing to a different device later on.

Windows

Color documents will print in black and white if you copy artwork between applications using the Windows clipboard. The Macintosh clipboard will retain color information when copied between programs while the Windows clipboard will not.

Modern Memory Manager: Frequently Asked Questions (4/97)

Revised: 4/28/97
Security: Everyone

Modern Memory Manager: Frequently Asked Questions (4/97)

=====

Article Created: 28 July 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article contains frequently asked questions (FAQ) on the Modern Memory Manager.

Questions in this FAQ:
=====

- 1) What is the Modern Memory Manager?
- 2) What is the expected performance increase by turning on the Modern Memory Manager on a Power Macintosh?
- 3) Should Modern Memory Manager be turned OFF on Power Macintoshes that are not running lots of native applications?
- 4) Does Modern Memory Manager cause crashes if the system is not running native applications?

DISCUSSION -----

- 1) Question: What is the Modern Memory Manager?

Answer: The Modern Memory Manager is a completely rewritten native version of the previous Memory Management code found in operating systems previous to System 7.1.1. It offers better performance than the previous 680x0 assembly code because it runs in the native PowerPC environment. In addition, performance enhancements were made by significantly improving the heap management algorithms.

It is possible to disable this new Memory Manager and revert to the old Memory Manager in ROM. This is done through the Modern Memory Manager panel in the Memory control panel. The default setting is Modern Memory Manager On.

2) Question: What is the expected performance increase by turning on the Modern Memory Manager on a Power Macintosh?

Answer: When you turn off Modern Memory Manager, you are essentially running the Memory Manager in emulation mode, rather than in native PowerPC mode. Engineering has stated that activating Modern Memory Manager will yield a performance increase of about 20 to 30 percent, although with some applications, that number can be as high as 200 percent.

3) Question: Should Modern Memory Manager be turned OFF on Power Macintoshes that are not running lots of native applications?

Answer: All Power Macintosh systems ship from the factory with the Modern Memory manager turned ON. There are many benefits to leaving the Modern Memory Manager ON. The new Memory Manager uses native PowerPC code and better algorithms for faster performance. The Modern Memory Manager should only be turned OFF if a user's application or extension is experiencing compatibility issues.

4) Question: Does Modern Memory Manager cause crashes if the system is not running native applications?

Answer: The Modern Memory Manager does NOT cause crashes if the user is not running native or FAT applications. Non-native applications and other software written according to Inside Macintosh guidelines for the original Memory Manager should be compatible with the Modern Memory Manager. Non-native applications and other software that do not follow the Inside Macintosh guidelines could potentially crash while calling on the Modern Memory Manager's services. You can test compatibility by turning off the Modern Memory Manager in the Memory control panel.

Apple Developer Technical Support issued Technical Notes ME13 & ME14 back in 1993 to help developers write compatible software. These Technical Notes are publicly available via the internet via Apple's Web site.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a

week.

Power Macintosh 7200 & 7500: Tall PCI Cards Do Not Fit (3/96)

=====

Article Created: 31 July 1995
Article Reviewed/Updated: 28 September 1995

TOPIC -----

Apple revised the baffle which helps stabilize Peripheral Component Interconnect (PCI) cards in the Power Macintosh 7200 and 7500 series computers. A modified baffle was used prior introduction of these computers, however in isolated cases some customers may have the previous baffle design. This article contains information to help you identify which baffle the customer has in their Macintosh computer.

DISCUSSION -----

Initially some PCI cards were too tall, and did not fit properly in the Power Macintosh 7200 and 7500 series computers. This often occurred when the PCI card had a SCSI or similar connector on the top of the card.

Identifying Modified Baffle
=====

There is a modified baffle, which can help with tall PCI cards. The modified baffle can be identified by examining the baffle. The bottom surface has a curved ribbing. If baffle has missing or non-continuous horizontal ribs between the two vertical curved ribs, you have a modified baffle. This helps with some PCI cards, but depending on the location of the card's connectors, the modified baffle still may not allow customers to use taller PCI cards.

The PCI specification Apple followed when creating the Power Macintosh 7200 and 7500 series computers was not specific enough about the height of the cards. Apple interpreted the PCI specification in one manner while some third parties interpreted the specification in another way. After investigation, it has been determined that Apple followed the specification properly. It is possible that the third-party vendors whose cards do not fit properly may have interpreted the height specification incorrectly.

To workaroud the problem, try removing the plastic 'baffle' cover used to cover the top edge of the cards. Be extremely careful to check for proper clearance when re-attaching the Macintosh computer's top case cover. If it still does not fit, check with the third-party vendor in question for reports of the issue and a possible resolution.

Power Macintosh Computers: Supported Microphones (6/96)

Article Created: 31 July 1995
Article Reviewed/Updated: 27 June 1996

TOPIC -----

What type of microphone devices are supported for use with the Power Macintosh computers?

DISCUSSION -----

Power Macintosh 6100, 7100, and 8100 Series

For the first generation of Power Macintosh computers (the 6100, 7100, and 8100 series), the microphone input jack supported line-level input signals. Apple provided the PlainTalk microphone with these computers. It is a line-level input device with a longer connector than Apple's previous microphone which receives some power from the computer. Other line-level devices were also supported via the microphone input jack on these computers.

Power Macintosh 7200 Series

For the Power Macintosh 7200 series computers, Apple provides an extension called Sound Input Amplification. It can be installed from the Apple Extras folder on the internal hard drive or System CD-ROM disc. This extension modifies the Sound control panel to provide an "amplification" menu option. With amplification turned on, sound input is amplified +25 dB, and some third-party mic-level microphones will work with the Power Macintosh 7200. Users with an Apple PlainTalk microphone should leave the Amplification setting at the default settings because this microphone comes with a pre-amplifier and produces sound at line-level.

Power Macintosh 7500, 7600, and 8500 Series

For the Power Macintosh 7500, 7600, and 8500 series computers, only line-level input devices like the PlainTalk microphone are supported at this time. The Power Macintosh 7500, 7600, and 8500 series computers also support stereo

connections via line-level RCA connectors which make it easy to connect to standard audio/video components.

Power Macintosh 7200/90: Processor Fan Power Connector (8/95)

=====

Article Created: 31 July 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

Where does the processor fan power connector attach to the logic board of the Power Macintosh 7200/90 computer? I cannot seem to find it.

DISCUSSION -----

For the Power Macintosh 7200/90 computers that come with processor fans (not all of them do), the power connector for the fan attaches at J70, very near the upper left corner of the microprocessor on the logic board.

Power Macintosh: Energy Saver Message at Startup (9/96)

=====

Article Created: 31 July 1995
Article Reviewed/Updated: 17 September 1996

TOPIC -----

Every time I start my new Power Macintosh 7200, 7500, or 8500 I get a message that describes my Energy Saver software. There are two options: OK, or Specify Settings. What should I do?

DISCUSSION -----

The Power Macintosh 7200, 7500, and 8500 computers include energy conservation software called Energy Saver. As configured by Apple, these systems are set to automatically shutdown after 30 minutes of inactivity.

These settings can be easily modified with the Energy Saver application. Each time you start your Macintosh, a message is displayed explaining the Energy Saver settings and providing an option to open the application. This message displays each time the computer starts until you click Specify Settings to open the application.

If you do not want to see this message each time you start up, click the Specify Settings button and configure the Energy Saver control panel. The message will no longer appear at startup unless the Energy Saver control panel preference file is removed from your system folder.

Apple does not recommend removing the Energy Saver program from your system folder. Since the Energy Saver application is an integral part of the operating system, removing its components prevent you from changing the current settings. The system continues to use these settings even when the application has been removed. If you want to disable the Energy Saver features, keep the Energy Saver software installed on the system and use the application settings to turn off the various features.

The Energy Saver application is not a control panel and does not function on any operating system prior to System 7.5.2.

System 7.x: Allocating More Memory to a Program (9/95)

Revised: 9/27/95
Security: Everyone

System 7.x: Allocating More Memory to a Program (9/95)

Article Created: 31 July 1995
Article Reviewed/Updated: 27 September 1995

TOPIC -----

I am getting a message that tells me I do not have enough memory to open a particular file with one of my applications. How do I make more memory available for an application with System 7.1 or System 7.5?

DISCUSSION -----

This message is generated by your application program. Your program is reporting that it needs more memory to open your document. This message can appear when you attempt to open large files such as long text documents, long QuickTime movies, or any file larger than you usually work with.

You can set your application to request more memory from the Macintosh System software with the following procedure.

Follow these steps to allocate additional memory to an application program:

Step 1

Quit the application if it is running.

Step 2

Locate and click once on the application icon on your Macintosh hard drive (not the icon in the Launcher or an alias to the application).

Step 3

Choose Get Info from the File menu.

Step 4

..TIL18278-System_7-x-Allocating_More_Memory_to_a_Program_9-95.pdf

Make sure the Kind: is application program and not folder, alias' or document.
If it does not say application program, the Memory Requirements area will not be visible.

Step 5

For System 7.1 or greater, double click on the number next to the Preferred Size box in the Memory Requirements area.

Step 6

Increase the amount of memory allocated to the application in the Preferred Size box to approximately 25% to 50% more. (Example: change 1000 K to 1500 K)

Step 7

Close the Get Info window.

The next time you launch the application it asks the system to allocate to it the amount of memory in the preferred memory size box. If the system does not have the requested free RAM available, it tries to allocate a progressively decreasing amount of RAM until it decreases to the amount in the minimum requirements box in the Get Info window. If the amount of free RAM available falls below the minimum, the system reports there is not enough memory launch the application.

DOS Compatibility: Using Legent Prevail (8/95)

Revised: 8/7/95
Security: Everyone

DOS Compatibility: Using Legent Prevail (8/95)

=====

Article Created: 7 August 1995

TOPIC -----

I am using Prevail, a Windows-based application, to connect to the school district mainframe via asynchronous modem. I am using Prevail in the PC mode of a Power Macintosh 6100 DOS Compatible system. Prevail works as a client to a mainframe application called SAR, a school financial management system. I use Prevail to download reports generated by SAR to the Macintosh.

Prevail connects to the mainframe and allows initial login, but once accessing VTAM, Prevail begins to display spurious characters wrapped around the normal text (it appears it is attempting to display control characters).

The screen then returns the cursor to the upper-left of the screen and no longer displays any line breaks or returns -- all characters display in the same initial position of the screen (row 1, column 1). I can see the stream of characters appearing over the top of one another.

I tested Prevail versions 1.04.03 and 1.05 beta A and got the same behavior. I removed all unnecessary extensions on the Macintosh side and all unnecessary lines in the AUTOEXEC and CONFIG.SYS files and still had the problem. The same behaviour appears whether Windows is running in Standard or Enhanced mode.

Both application versions work properly under SoftWindows, either the Power Macintosh version or the 68040 version. Settings identical to those used with the DOS Compatible system and the same modem and modem cable were used to test this.

What is wrong?

DISCUSSION -----

Prevail does not function on the Power Macintosh 6100 DOS Compatible. This is due to Prevail's method of handling an expected signal change that never occurs, according to the developers at Legent. The signal change never occurs because

the signal is not available on the Power Macintosh 6100 DOS Compatible (RTS) due to the Macintosh RS-422 serial port implementation.

The Legent Pravail developers are aware of this problem.

Workaround

You can try using SoftWindows, an HLLAPI connection (network connection to the mainframe to bypass the serial port limitations), or a different software package that has more robust serial port drivers.

Contact Legent for additional information on the Prevail application. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

LaserWriter 8.3:Color LaserWriter 12/600 PS ReadMe (4/97)

Revised: 4/3/97
Security: Everyone

LaserWriter 8.3:Color LaserWriter 12/600 PS ReadMe (4/97)

=====

Article Created: 01 August 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article contains the Read Me file included with LaserWriter 8.3 software which ships with the Color LaserWriter 12/600 PS Printer.

DISCUSSION -----

About Your Apple Macintosh LaserWriter Printer Software

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference. The topics are:

- Installing the Printer Driver Software
- Desktop PrintMonitor Version 1.0.1
- Apple Printer Utility Version 2.0
- LaserWriter 8 Printer Driver Version 8.3
- Using the Apple Color LaserWriter 12/600 PS Printer
- Obtaining Printer Supplies for the Apple Color LaserWriter 12/600 PS

Installing the Printer Driver Software

The manual that comes with your printer contains detailed installation instructions. You cannot install the software and fonts by dragging their icons to your hard disk; you must use the Installer program as described in the printer manual. Your Macintosh must have System 7.1 or later. The printer software does not support QuickDraw GX systems.

IMPORTANT Before installing the printer software, restart your system with all Extensions turned off. To do this, hold down the Shift key while you restart your computer. Hold the Shift key down until you see the message "Extensions Off" or until your normal desktop appears.

The Installer does not remove versions of the LaserWriter printer driver that are older than version 8.0. If you no longer need these files, you may remove them from your System Folder.

The Installer does remove older versions of the LaserWriter 8 driver (for example, LaserWriter 8.0) and replaces the PPD files for Apple LaserWriter printers with the latest versions.

When you choose Easy Install, the Installer places the following files in the System Folder on your hard disk:

- LaserWriter 8.3 is placed in the Extensions folder.
- The PPD files which are used by LaserWriter 8 are placed in a folder called Printer Descriptions also located in the Extensions folder.
- TrueType fonts are installed in the Fonts folder.
- The Apple Printer Utility and this Read Me file are placed in the Apple LaserWriter Software Folder.
- For desktop printing, Desktop Print Monitor, Desktop Printer Spooler, and Desktop Printer Extension are placed in the Extensions folder.
- ColorSync 2.0 is placed in your Extensions folder. The ColorSync profiles are placed in a folder called ColorSync Profiles in the Preferences folder in the System Folder. The ColorSync System Profile control panel is placed in the Control Panels folder in the System Folder.
- If your system has System Software 7.1 or 7.1.1, Finder 7.1.3 is placed in your System Folder and Finder Help 7.1.3 is placed in the Extensions folder.
- If your system has System 7.1, 7.1.1, or 7.1.2, these files are placed in the Extensions folder: Thread Manager 2.1, Network Extension 7.1.3, Macintosh Drag and Drop 1.1.1, and Dragging Enabler 1.1.1.

IMPORTANT If the Installer is unable to remove old files from your hard disk, it will terminate the installation procedure. If this happens, please remove old copies of the LaserWriter 8 driver and the PPD files. Then move your Fonts folder from the System Folder to the desktop. Run the installer again. Once installation is complete, move the fonts from the Fonts folder on the desktop back to the new Fonts folder in your System Folder.

Desktop Print Monitor Version 1.0.1

Creating Desktop Printers

You create desktop printers by selecting a printer in the Chooser. The desktop printer icon is created when you close the Chooser.

Using Desktop Print Monitor on a non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an older

version of the PrintMonitor. Newer versions of the PrintMonitor are not replaced.) You have three choices:

- Use PrintMonitor 7.1.2 (or a later version)
- Obtain a set of installation disks of the printer software in the language of your system software from your Apple-authorized dealer and install it.
- Upgrade your system software to System 7.5 and install the printing software again. An English language version of the Desktop PrintMonitor is installed.

Removing the Desktop Printing Software

The desktop printing software uses both the Desktop PrintMonitor and the PrintMonitor software. The Desktop Print Monitor requires 200-400K bytes more free system memory in addition to the memory required by the PrintMonitor. If you don't want to use the desktop printing software, you can remove it. Follow these steps:

1. Drag any print spool files found in the PrintMonitor Documents folder (in the System Folder) to the Trash. Warning: these jobs will not be printed.
2. Restart your computer with the extensions off by holding down the Shift key and choosing Restart from the Special menu. Hold the Shift key down until the message "Extensions Off" appears or until your normal desktop appears.
3. Drag the following files from the Extensions folder to the Trash:
 - . Desktop PrintMonitor 1.0.1
 - . Desktop Printer Spooler 1.0.1
 - . Desktop Printer Extension 1.0.1.
4. Restart your computer.

Using Save or Open with Desktop Printers

When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

Having More Than Five Desktop Printers

If you want to have more than five or six desktop printers, you must increase the Desktop PrintMonitor memory allocation by 10K for each additional desktop printer you want. To do so, select its icon--it's in the Extensions folder inside the System Folder--choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

Apple Printer Utility Version 2.0

Installing the printer software creates the Apple LaserWriter Software folder and places within it this ReadMe file and the Apple Printer Utility program version 2.0. The Apple Printer Utility program is designed to work with all Apple PostScript Level 2 printers.

Downloading PostScript Fonts on a GX System with the Apple Printer Utility

When GX is installed any PostScript fonts (often called Type 1 fonts) in the

Fonts folder are converted to GX fonts, and the original PostScript fonts are copied to a folder called •Archived Type 1 Fonts• which is created in the System Folder. If you want to download these fonts to your printer using the Apple Printer Utility, you must send the fonts in the •Archived Type 1 Fonts• folder, not the GX-converted versions in the Fonts folder. Downloading GX fonts that have not been converted by GX works correctly.

Removing Fonts from a Hard Disk Attached to the Printer

If a font is downloaded to both the printer's RAM and the printer's hard disk with the same name, and you remove the font on the hard disk, the RAM font will also be removed. If you remove the RAM font, the font on the hard disk will not be removed.

LaserWriter 8 Printer Driver Version 8.3

The software includes version 8.3 of the Apple LaserWriter 8 printer driver, which works with many Apple LaserWriter printers. This section includes information about the software and information on using it with several of the printers.

What's new in version 8.3

LaserWriter 8 now provides support for color-matching and for embedded JPEG-compressed documents. LaserWriter 8 now supports ColorSync 2.0, Apple's latest system software for device-independent color-matching services, and PostScript Level 2 color-matching.

Using Color-matching

When ColorSync 2.0 is installed and when the ColorSync Profiles folder contains printer profile(s) there are two options for color/grayscale output:

- ColorSync Color Matching invokes the ColorSync system software to perform color matching for the printed document, matching your monitor and printer's profile and sending the correct CMYK information to the printer. With ColorSync Color Matching, most of the work is done by your Macintosh.
- PostScript Color Matching is an alternative to ColorSync Color Matching. This option is a good choice when printing to a PostScript Level 2 printer and when it is efficient to let the printer do most of the work.
- Documents that use ColorSync 1.0 embedded profiles convert to the profile set up in the ColorSync 2.0 System Profile control panel.
- When printing with PostScript Color Matching selected and ColorSync 2.0 is not installed, the driver uses the Apple 13" RGB Standard profile.
- Applications that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the problem.

PPD Files

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, click the Setup button in the Chooser when selecting your printer for the first time, or after installing an additional option. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

Creating EPS Files

You can create an Encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, an extremely large file may be created.
- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.
- When you create EPS files with preview information included, other applications that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver With LaserWriter Printers

When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers

- The LaserWriter 8 driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text in some documents reflows or is clipped to fit the new imageable area. To maintain your document format when printing to different printer models, deselect the Larger Print Area option in the Page Setup Options dialog box.
- Some older printers with small amounts of memory will not print documents containing large numbers of fonts unless you select the Unlimited Downloadable Fonts option in the Page Setup Options dialog box. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup Options dialog box and print again.

- Printing multiple documents with the Finder may not work if the documents have been created by different application programs.
- If you encounter a time-out (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.

LaserWriter 16/600 PS

If Tray Switching is turned on and you have an optional 500-sheet feeder that contains the same size paper as the 250-sheet feeder, use the 500-sheet feeder as the preferred paper source for optimal printing performance. See Chapter 5 in the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

LaserWriter Pro 810

- With some graphics applications, bitmapped graphics printed with the Precision Bitmap Alignment option in the Page Setup Options dialog box will be reduced in size by 25%.
- When you create a PostScript file with a LaserWriter Pro 810 selected as the printer and send the file to a printer that uses PostScript Level 1, a PostScript error will occur.

LaserWriter Pro 600 and 630

- When you print envelopes from the optional envelope feeder, you cannot use Auto Select as the Paper Source (in the Print dialog box).
- When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

LaserWriter II NT and II NTX

- If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.
- Do not use the B5 tray to print envelopes on a LaserWriter II NT. Use the letter tray instead.

LaserWriter IIg and IIx

- When you select paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.
- The US Legal paper size has been changed on some LaserWriter IIx/IIg printers to be more compatible with other Apple LaserWriter printers. If your legal-sized documents no longer fit on the page, select Larger Print Area in the Page Setup Options dialog box.

- Some form-printing applications cannot print forms using the Layout settings in the Page Setup dialog box.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.5.1 or later.

Using the LaserWriter 8 Driver With Application Programs

Some application programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

- With many applications, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.
- Some applications may not be able to print from the Finder or use the Drag and Drop printing feature.
- Some applications may print in color when Black and White mode is selected.
- Applications that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the problem.

Adobe Illustrator 5.5

- Multiple-page documents may not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

Adobe Photoshop 2.5 and 3.0

- Photoshop may print in color when black-&-white mode is selected.

Aldus Freehand 4.0 & Freehand 5.0

- Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- Some paper sizes in Freehand may not be supported by the printer and may generate Postscript errors.

Aldus PageMaker 5.0

- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.

- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus Personal Press 2.02

- Using several font style combinations in text can result in spacing problems.

Aldus SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

Canvas 3.5.2

- When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if you use the Geneva, New York, or Monaco fonts.

ClarisDraw 1.0

- Some shapes that contain gradients may not print correctly.

CricketDraw III 2.01

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, underlined TrueType fonts may not print.

CricketPresents 2.1

- You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

DeltaGraph Pro 3.0.4

- Printing with Unlimited Downloadable Fonts may cause some elements to be shifted and fonts to substitute Courier.

FileMaker Pro 2.1

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Informed Designer/Manager 1.4.2

- Do not print documents that contain JPEG images in Black and White mode; your system will restart.
- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

MacDraft 3.01 and earlier versions

- When you print using the Cut Marks option, a PostScript error results.

MacDraw Pro 1.5

- Rotated text within a frame that is placed in another application may not print correctly.

MacWrite Pro

- Colored text with colored underlines may not print correctly from the Finder.

Microsoft Excel 5.0

- Colored horizontal cell borders will often not appear in the printout. This happens with any color printing option and on most printers.

Microsoft PowerPoint 3.0

- Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

- Printing documents that have rotated objects with rounded corners results in a PostScript error.

Microsoft Works 4.0

- There are 24 new shapes available through the tools palette. Colored shadows for any of these shapes will appear correctly on screen. But these colored shadows will only print in gray, regardless of what the print color options might be.

Painter 3.0

- When you print using the Invert option, images do not print inverted correctly.

PixelPaint Pro 3.0

- When you print using the Invert option, images do not print inverted correctly.

Publish It!

- Use a pre-LaserWriter 8 version of the driver, or contact the publisher of the application program.

QuarkXPress 3.3.1

- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- With some PPDs (LW 630, PLW 320), cropped graphics may not print correctly.
- Some imported JPEG files may not print correctly.

RagTime 3.2

- You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

- Use ReadySetGo! version 6.0 with the LaserWriter 8 printer driver; earlier versions will not work.
- When Unlimited Downloadable Fonts option is selected, ReadySetGo! will not print a document containing a JPEG, text, and polygons.
- You may not be able to print documents that contain layers of text, graphics, then text with Unlimited Downloadable Fonts option selected.
- You cannot print documents that use pen patterns.

Studio/8 & Studio/32

- When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.

WordPerfect 3.0

- When you select the Unlimited Downloadable Fonts option and print rotated text in Watermark, the entire document rotates when printed.
- When you select the Unlimited Downloadable Fonts option, Watermark option, and Color/Grayscale option, black text prints as gray.

How to Get Updated Printer Software

=====

The latest LaserWriter 8 software is posted to the following commercial online services and Internet sites.

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Using the Apple Color LaserWriter 12/600 PS Printer

This section provides additional information on using the Color LaserWriter 12/600 PS Printer.

About the Demonstration Page

When the power is turned on, by default the Color LaserWriter 12/600 PS prints a startup page and a demonstration page. For legal and b5 paper sizes only the startup page prints; the demonstration page is not printed.

About the Apple Color LaserWriter 12/600 PS Status Panel

As described in the Color LaserWriter 12/600 PS manual, Appendix G, the status panel lights aid in indicating hardware service problems found during printer startup. If the Paper Out and Paper Jam lights are blinking alternately, a hardware problem has been detected. To identify the specific problem, notice which toner lights (C, M, Y, Bk) and how many of the maintenance lights (in the area on the right-hand side of the status panel) are lit, and refer to the table below:

Toner Lights ON -----	# Maintenance Lights ON -----	Problem -----
C	0	I/O Controller Board
C	1	SIMM, Slot J11
C	2	SIMM, Slot J10
M	2	Hard Drive
M	3	I/O Controller ROM
Y	0	Fuser
Y	1	Oil Pump in Fuser
Y	2	Thermal Sensor in Fuser
Y	3	Paper Feed Unit
K	0	DC Controller
K	1	Power Supply
K	2	Toner Carousel
K	3	Laser/Scanner Circuit
M & Bk	0	Main Motor
M & Bk	1	Drum Motor
M & Bk	2	Laser/Scanner
C & Bk	0	Controller Fan
C & Bk	1	Fuser Fan
C & Bk	2	Main Fan

Obtaining the Best Results for Business Graphics

To obtain the best results for business graphics, colors should be 100% saturated. For example, to print pure yellow, define yellow as 100% red and 100% green without any blue. Then print your document, selecting the Color/Grayscale option in the Options Print dialog.

Printing on Legal-sized Paper

In the standard memory configuration, the Color LaserWriter 12/600 PS uses a higher compression technique for legal-sized paper using only the cyan, magenta and yellow color planes. As a result of this compression technique, very complex pages may show missing pixels in fine lines or small text, "jaggies" (edges with low-resolution appearance) and color changes. To improve the image quality of such pages, you can increase the printer's memory to 16 MB or more. With at least 16 MB of printer memory, the Color LaserWriter 12/600 PS can

achieve the same quality with legal-size pages as with letter and A4 sizes using all four color planes (cyan, magenta, yellow and black.)

Printing Images on the Color LaserWriter 12/600 PS Printer

The Color LaserWriter 12/600 PS Printer's highest resolution for printing images is 150 x 150 dpi. No gain in image quality is achieved if higher resolution images are used. All other types of documents print at 600 x 600 dpi.

The Density Control Panel

The printer has been adjusted at the factory to produce the best possible image quality. There are always small variations in color between different printers. You can use the density control panel on the back of the printer to make subtle changes. Changing the settings however may produce images of an inferior quality. To return to the factory settings, press both the + and - buttons on the density control panel together.

Setting Your ColorSync System Profile for Best Printing Results

Before using ColorSync color-matching to print to the Color LaserWriter 12/600 PS printer, set the ColorSync System Profile for the monitor connected to your system. To do this open Control Panels in the System Folder and double-click ColorSync System Profile. Make sure the following settings are selected:

- Set the profile for the monitor connected to your system. For the best color match when printing, select the "page-white" or "D50" system profile for your type of monitor if one is available.
- For the best visual match between the colors on your monitor and printed colors, select the Page-White Gamma option in the Monitors control panel. To select a gamma option, open the Monitors control panel, then hold down the Option key while you click the Options button. In the Options window, click the Use Special Gamma checkbox to put a check in it. Then choose Page-White Gamma from the menu.
- On a multiscan monitor, make sure that the color temperature, or intensity, is set to 9300K (the default setting). See the monitor manual for instructions. If the Page-White Gamma option is selected with a color temperature other than 9300K, your monitor colors could look too red or too blue compared to printed colors.

Obtaining Printer Supplies for the Apple Color LaserWriter 12/600 PS**

To order printer supplies for the Color LaserWriter 12/600 PS direct from Apple, call 1-800-600-7805. For order numbers, see Appendix A of the printer manual:

- toner cartridges
- transparencies
- photoconductor cartridge (includes toner disposal boxes)
- fuser oil
- fuser

Instructions for replacing the fuser are in Appendix F of the printer manual. Instructions for replacing other printer parts come in the new packages.

For the location of the nearest Apple-authorized dealer, call 1-800-538-9696,

extension 525.

Adobe and PostScript are trademarks of Adobe Systems Incorporated, which may be registered in certain jurisdictions.

End ReadME File

**This is not included in the original ReadMe file:

Here are the parts available through 1-800-600-7805:

Color LaserWriter Cyan Toner Cartridge:	M3757G/A
Color LaserWriter Magenta Toner Cartridge:	M3760G/A
Color LaserWriter Yellow Toner Cartridge:	M3758G/A
Color LaserWriter Black Toner Cartridge:	M3756G/A
Color LaserWriter Photoconductor Replacement Kit:	M3761G/A
Color LaserWriter Fuser Oil:	M3755G/A

Cassettes, transparencies, and networking options are not available through this number.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Color LaserWriter 12/600 PS: Paper Specifications (8/95)

Revised: 8/1/95
Security: Everyone

Color LaserWriter 12/600 PS: Paper Specifications (8/95)

=====

Article Created: 01 August 1995

TOPIC -----

What weight of paper can be used in the Color LaserWriter 12/600? What type of paper can be used in the Color LaserWriter 12/600?

DISCUSSION -----

There are two different ratings for paper weight. "Book" or "Offset" paper is measured on a system based on weight per thousand sheets. This is the type of paper used by printing companies and most often used with letterhead. "Bond" or "Stock" is measured on paper content. The paper specifications on the 12/600 are listed in "Bond" measurements (16 to 28 pounds). The equivalent offset paper would measure about 40 to 80 pounds. You should use the multi-purpose tray for weights over 24 pound Bond or 70 pound Book.

The Color LaserWriter is designed only for Plain Paper use. Plain paper is copier paper or paper designed for laser use. For better looking output than that achieved by using plain copier paper, a number of high quality "laser" papers like Legacy, Nekoosa, and Hammermill are available at office supply or graphic arts stores. These papers offer a higher reflectance and thus brighter colors.

Rag content or linen paper will cause problems when printed on the Color LaserWriter 12/600 PS. The bottom portions of printed pages will have vertical streaks of white. Subsequent printouts will have the toner from the previous printed page. This is a result of the fibers of the paper being pulled off the paper onto the fuser rollers. Once on the fuser, they still have particles of toner attached and will leave colored marks on later pages.

NOTE:

Do not use coated Ink Jet paper as it has a clay coating that melts and jams in the fuser region -- a problem that will require service attention and possibly a new fuser.

Color LaserWriter 12/600 PS: QuickTake Images Print Red (8/95)

Revised: 8/1/95
Security: Everyone

Color LaserWriter 12/600 PS: QuickTake Images Print Red (8/95)

=====

Article Created: 01 August 1995

TOPIC -----

I have a QuickTake 150 and a Color LaserWriter 12/600 PS. My printer prints color images fine except when I try to print my QuickTake files, they appear to have a reddish tint.

DISCUSSION -----

The Quicktake software and the application Photoflash are both programs that work in the Red, Green, Blue (RGB) mode. This is called additive color. A printer operates in Cyan, Mangenta, Yellow, Black (CMYK) which is subtractive color. The difference being that a monitor emits light (a lightsource) where as a piece of paper reflects light (from exisiting light). Ink on paper is colored by light reflecting off the paper back up through the toner. That is why paper types can change the color printed on it.

To fix this, use the adjust colors function in Photoflash to increase the blue and green slider bars. Some image editing programs have built in "color balancing" filters which do the same thing. Sharpening the image and keeping the image set to "millions of colors" will also help.

Apple MessagePad: Frequently Asked Questions (4/97)

Revised: 4/28/97
Security: Everyone

Apple MessagePad: Frequently Asked Questions (4/97)

=====

Article Created: 1 August 1995
Article Reviewed/Updated: 19 April 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about the Apple MessagePad.

Questions in this FAQ:

=====

- Does the Newton Connection Kit for Macintosh support Claris Organizer direct transfers?
- Is it possible to print to an Apple Color StyleWriter 2400 from my Apple MessagePad?
- Why does the Apple MessagePad put zeros or other characters as prefixes to phone numbers?
- How much system heap should I have on my Apple MessagePad 120? How can I increase the available heap space?
- Does the current AC Power Adapter being sold for the Apple MessagePad work for all models?
- Can I use an Apple MessagePad 110 rechargeable battery pack in an Apple MessagePad 120?
- How can I get the upgrade to Newton Connection Kit for Macintosh version 2.0.2?
- Can I upgrade an Apple MessagePad 100 to an Apple MessagePad 120?
- What is the status of the Apple MessagePad upgrade program for the Apple MessagePad 100?

- What do I need in order to use a non-Apple modem with my Apple MessagePad?

DISCUSSION -----

Question: Does the Newton Connection Kit for Macintosh support Claris Organizer direct transfers?

Answer: No. The current version of the Newton Connection Kit for Macintosh, version 2.0, does not have a translator for Claris Organizer. However, you can create custom templates that may allow you to import and export information to your Newton Connection Kit file. The instructions are included in the addendum that accompanies the Newton Connection Kit for Macintosh User's Guide.

Question: Is it possible to print to an Apple Color StyleWriter 2400 from my Apple MessagePad?

Answer: Currently, printing to the Color Stylewriter 2400 is not supported. Here is a list of Apple printers support by the MessagePad:

StyleWriter,
StyleWriter II,
Personal LaserWriter LS,
Personal LaserWriter 300 (Use the Personal LaserWriter LS driver),
LaserWriter Plus,
LaserWriter IINT and NTX,
LaserWriter IIf and IIg,
LaserWriter Select 360
LaserWriter Pro 600 and 630,
Personal LaserWriter NT and NTR.

Portable StyleWriter is supported by the Newton Print Pack - use the Canon BJ10e option.

Question: Why does the Apple MessagePad put zeros or other characters as prefixes to phone numbers?

Answer: The Apple MessagePad uses the information you have entered in the Personal Preference screen to determine how the phone number needs to be formatted for dialing.

When you set your Country preference in your Personal Preferences, you must tap Country, then select a country from the list that appears. In this case, you are in the United States, so you will select USA.

If you write the country name in the Country preference blank instead of selecting from the list, your Apple MessagePad does not understand what country you are in, and this problem occurs.

To set your access code, tap the Options button in the Call Slip window. Write in the access code needed to use your European account.

Question: How much system heap should I have on my Apple MessagePad 120? How can I increase the available heap space?

Answer: The Apple MessagePad has 110k of heap space. Apple is not aware of any application that increases the amount of heap space on an Apple MessagePad. If you have any soups on the Apple MessagePad, which are left from items that are no longer being used, you should remove them. There are various shareware utilities available that let you see and remove them.

Here are some tips regarding managing heap space.

- Remove programs that you no longer use, including programs that reside on a memory card. Each additional program, besides those located in the Apple MessagePad's ROM, takes up an additional 2K of heap memory.
- Close the Extras drawer after running any application. This saves another 3K of system memory.
- Avoid using a large number of programs that run continuously after installation. These programs consume large amounts of system memory and slow performance.

You can identify these types of programs by the way they work. If you have a program that always adds a button on a particular screen or has a "floating" window that is always available, it may be a program that is always running.

Question: Does the current AC Power Adapter being sold for the Apple MessagePad work for all models?

Answer: H0003Z/A is the Apple part number for the AC Adapter for the Apple MessagePad in the United States. It is compatible with all Apple MessagePad models and the Newton Charging Station, which are used in the United States.

Please contact the Apple Referral Center at 800-538-9696 to obtain a phone number for a local Apple-authorized Reseller.

Question: Can I use an Apple MessagePad 110 rechargeable battery pack in an Apple MessagePad 120?

Answer: Yes, you can use the rechargeable battery pack from the Apple MessagePad 110 in the Apple MessagePad 120. The accessories for the Apple MessagePad 110 and Apple MessagePad 120 are identical and interchangeable.

Question: How can I get the upgrade to Newton Connection Kit for Macintosh version 2.0.2?

Answer: Apple does not offer an upgrade to this version of the Newton Connection Kit for Macintosh. Version 2.0.2 only differs from previous versions in that it corrects an issue some customers experienced when importing large notes from

Microsoft Word. There is no new functionality.

If you are experiencing problems importing very large notes into the Connection Kit from Microsoft Word, please the Apple Assistance Center at 1 800-SOS-APPL.

Question: Can I upgrade an Apple MessagePad 100 to an Apple MessagePad 120?

Answer: Apple offers no option to upgrade the Apple MessagePad 100 or 110 to an Apple MessagePad 120. You can, however, update to Newton System Update 1.3 (the system update that comes with the 120)

Question: What is the status of the upgrade program for the Apple MessagePad 100?

Answer: The upgrade program for owners of the original Newton MessagePad has ended.

Question: What do I need in order to use a non-Apple modem with my Apple MessagePad?

Answer: In conjunction with a modem setup package, the Newton Modem Enabler 1.0 allows the use of a non-Apple modem with an Apple MessagePad 110 or 120. The Modem Enabler has not been tested with previous Apple MessagePad models and is not supported on them.

The Newton Modem Enabler 1.0 may be downloaded from the USA Apple Software Updates on any of the following online services:

- * America Online - keyword: applecomputer
- * CompuServe - GO APLSUP
- * Internet -
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com>>

Each modem has its own modem setup package, which is typically provided by the modem manufacturer. The modem setups supplied with the enabler include:

- . HayesCompatible.pkg
- . HayesErrorCorrecting.pkg
- . MotoCELLect14.4.pkg
- . MotoCELLectCellular.pkg

The Read Me document that accompanies the Modem Enabler explains what you need to do before installing Modem Enabler 1.0 and modem setup packages, what to do to install them, and how to work with them after they are installed.

Check with the manufacturer of your modem to verify its compatibility with the Apple MessagePad.

Desktop Printer Spooler 1.0.1 and PowerTalk 1.1 Issue (9/95)

Revised: 9/28/95
Security: Everyone

Desktop Printer Spooler 1.0.1 and PowerTalk 1.1 Issue (9/95)

Article Created: 1 August 1995
Article Reviewed/Updated: 28 September 1995

TOPIC -----

This article describes an issue using Desktop Printer Spooler 1.0.1 and PowerTalk 1.1 on certain Macintosh computers, and provides a workaround.

DISCUSSION -----

There is a known issue when using the Desktop Printer Spooler 1.0.1 with PowerTalk 1.1, which may cause a hang or crash on certain Macintosh computers. This hanging issue has been reproduced:

- With System Software 7.5 or 7.5.1
- With PowerTalk 1.1
- With Desktop Printing Software 1.0.1 (installed with Color LaserWriter 12/600 PS, LaserWriter 4/600 PS, and Color StyleWriter 2200 and 2400 printer software)
- On certain Macintosh computers (Quadra 840AV, Quadra 660AV, Macintosh 630 series, PowerBook Duo 230 and 280, and Macintosh II)

Workaround

The LaserWriter 8.3 Installer, a three disk set posted to online services, contains a revision of Desktop Printing Spooler Software from version 1.0.1 to 1.0.2. Desktop Printer Spooler 1.0.2 is recommended for anyone experiencing this issue. Also the Desktop Printer Spooler 1.0.2 has been posted separately if this is all you need.

Another workaround is to use a third-party extensions manager and have the Desktop Printer Spooler load last. Renaming or relocating the file causes it not to function properly.

Another workaround is to use a third-party extensions manager and have the Desktop Printer Spooler load last. Renaming or relocating the file will not

function properly.

These articles can help you locate the software update mentioned here:

AppleShare Client for Windows: AARP Issue (8/95)

Revised: 8/1/95
Security: Everyone

AppleShare Client for Windows: AARP Issue (8/95)

=====

Article Created: 1 August 1995

TOPIC -----

On a Windows client, when AppleTalk is initializing, a response to the first AARP (AppleTalk Address Resolution Protocol) Probe packet causes the stack to transmit another AARP Probe packet with a different tentative node address. If this second probe packet receives a response, the Windows stack continues to transmit AARP Probe packets with this same tentative node address. Is there a way to workaround this?

DISCUSSION -----

This problem will be addressed in the next release of the AppleShare Client for Windows software. As of this writing, there is no known date when this software will be available.

In the meantime, a workaround is to manually edit the AppleTalk node parameter in the SYSTEM.INI file. This address is under the [AppleTalk] heading, as can be seen in the following example:

```
[APPLETALK]  
NODE=74
```

Below is a brief description of how dynamic address assignment works:

Each protocol stack in a given node must have a protocol address. This address is usually assigned when the stack is initialized. AARP is used at AppleTalk startup time to find a unique node ID on the network. AARP must then make sure that the address it selects is not being used by another node on the data link. It does so by using the data link to broadcast a number of AARP Probe packets, which contain the tentative protocol address. When a node's AARP receives a Probe packet corresponding to one of its protocol stacks, it examines the protocol address of that stack. If the Probe's tentative protocol address matches the receiving node's address, AARP sends back an AARP Response packet to the probing node.

If the probing node receives an AARP Response packet, then the tentative protocol address is already in use and the node must pick a new tentative address and repeat the probing process.

Apple Internet Connection Kit (11/95)

Revised: 9/23/96
Security: Everyone

Apple Internet Connection Kit (11/95)

=====

Article Created: 1 August 1995
Article Reviewed/Updated: 27 November 1995

TOPIC -----

This article describes the Apple Internet Connection Kit (AICK).

DISCUSSION -----

The Apple Internet Connection Kit is an integrated collection of Apple and third-party software that allows customers to easily connect their Macintosh directly to the Internet. The Apple Internet Connection Kit is a one-stop shop for key Internet tools that let the user get started using the Internet. It works on LAN and dial-up access, and simplifies dial-up to an Internet Service Provider (ISP).

Features

- All-in-one solution for Internet connection
- One-button install for all key applications
- Auto-configures Internet applications for the individual system
- Makes signing up with an ISP quick and easy
- Facilitates connection to Internet through local area network (LAN) or through a phone line.
- Directs customers to Internet "hot spots" in the World Wide Web (WWW), newsgroups, and File Transfer Protocol (FTP) servers.

Bundled Software

- Internet Dialer Software
- Offers a choice of qualified ISPs; streamlines the process of registration and

..TIL18287-Apple_Internet_Connection_Kit_11-95.pdf

configures the applications to run on a specific system.

- Apple Guide for the Internet

Provides an enhanced on-screen help feature that leads users through tasks step-by-step to master the processes, procedures, and capabilities of the Internet.

- Netscape Navigator from Netscape Communications

Browser software for exploring the World Wide Web (WWW).

- Claris EMailer from Claris

Electronic mail product that enables users to send and receive multimedia rich email messages over the Internet.

- Fetch FTP software

Helps users access File Transfer Protocol (FTP) services to download specific files.

- Stuffit Expander decompression software from Aladdin

Automatically decompresses compressed files downloaded from the Internet.

- NewsWatcher browser software

Provides users with access to Usenet newsgroup discussions.

- NCSA Telnet terminal emulation software

Allows a Macintosh computer to emulate a terminal for connection to many libraries and catalogs.

- QuickTime VR Player

Allows users to view 3D multimedia presentations and QuickTime video clips downloaded from the Internet.

- Adobe Acrobat Reader

For viewing portable document format (PDF) files in their exact original format.

- Real Audio software

Provides AM quality audio through the Internet.

- Point-to-Point (PPP) software

Allows use of the MacTCP over the modem line so that Macintosh and Internet applications communicate with protocols used by the Internet (SLIP and PPP).

- Also included

- Documentation for bundled software on CD-ROM
- The "Getting Started" guide
- Both CD and floppy versions included in set

System Requirements

The Apple Internet Connection Kit requires

- Macintosh or Mac OS-based computer
- 8MB RAM minimum

..TIL18287-Apple_Internet_Connection_Kit_11-95.pdf

- System 7.5 or later
- TCP/IP -- either MacTCP or Open Transport/TCP
- 9600 bps or faster modem (14,400 bps recommended) or connection to LAN already connected to the Internet.
- 10MB available hard drive space (15MB recommended)
- High density floppy drive or CD ROM drive

Pricing and Availability

The Apple Internet Connection Kit is expected to be available in Sep 1995:

M4276LL/A Apple Internet Connection Kit

M4503LL/A Apple Internet Connection Kit (20 user)

ISP Support

Once users have selected and registered with an ISP, the ISP will offer support for the following:

- Basic product use
- Applications
- Billing
- Connection

Customer Satisfaction Issues

Apple is not offering the Apple Internet Connection Kit to K-12 institutions. The Apple Education Series Personal Internet Bundle, a product better suited to the needs of K-12 institutions, is already available to K-12 institutions

MAE 2.0.1: Patch Release 1 for MAE 2.0 (1/96)

Revised: 1/30/96
Security: Everyone

MAE 2.0.1: Patch Release "1" for MAE 2.0 (1/96)

Article Created: 1 August 1995
Article Reviewed/Updated: 30 January 1996

TOPIC -----

This article describes MAE 2.0.1 obtained through Patch Release "1" for Macintosh Application Environment (MAE) V2.0.

DISCUSSION -----

Apple has released MAE Patch 2, a newer patch. For more information on MAE Patch 2, search for the following Tech Info Library article, "MAE: Where to Find MAE Patch 2."

Apple has created and is distributing MAE V2.0.1, the first patch release for Macintosh Application Environment (MAE) 2.0. This patch release will alleviate several problems that have been identified.

The patch can be obtained over the Internet via FTP on the ftp.support.apple.com server, in the /pub/mae/patches directory. You will also find a README file with complete details on what is contained in the patch release as well as how to download and install the patch.

Please be aware that the patch is covered by a license agreement. You MUST read and agree to the license agreement before downloading and/or using the patch software.

NOTE: This patch cannot be used with the MAE V1.0 trial.

Changes In MAE 2.0.1
=====

The following changes were made to MAE 2.0.1.

Updated Man Page

The online manual pages now reflect changes and features of MAE 2.0 that were omitted from the man pages supplied with the MAE 2.0 distribution.

Network Control Panel

Opening the Network Control Panel will no longer result in an error message.

(Sun only) Attention Packets

Urgent ADSP (Apple Data Stream Protocol) messages are now delivered promptly to the MAE process. Previously, there was a delay in delivering these messages.

(Sun only) ADSP Close

Custom applications that send ADSP close packets now work correctly.

Utilization of Selected AppleTalk Zone

A previously-selected AppleTalk zone is now being used as the default zone. In addition, a list of eligible devices is presented when selecting a network resource (for example, a printer). This problem only occurred under isolated circumstances.

File Transfers Under TCP

Fetch or other applications now receive large (greater than 100K) files utilizing TCP correctly. (Smaller files were not affected.)

Saving Documents When Using MacinTax

MacinTax is now able to save documents.

(HP only) Users' Guide Updated

The online Users' Guide for MAE now reflects features and changes present in v2.0 which were omitted from the MAE 2.0 distribution.

Debugging Options

Additional command line options have been added to assist in debugging MAE 2.0 problems.

(Sun only) Support for CacheFS

New functionality was added to support CacheFS, a new file system introduced with Solaris 2.4.

Support For AFS (Andrew File System)

Additional features have been added to support local cells for AFS.

Other Fixes

Various minor bugs in MAE 2.0 are corrected in MAE 2.0.1.

This article was published in the "Information Alley":
Volume II, Issue 10, Page 6

Article Change History:

30 Jan 1996 - Updated with MAE Patch 2 information.

Performa 500 Series: Frequently Asked Questions (4/97)

Revised: 4/8/97
Security: Everyone

Performa 500 Series: Frequently Asked Questions (4/97)

=====

Article Created: 02 August 1995
Article Reviewed/Updated: 8 April 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Macintosh Performa 500 series computers.

Questions in this FAQ:
=====

- 1) Why can't I get a microphone from an earlier Macintosh computer to work on my Performa 500 series computer?
- 2) Can I upgrade my Performa 575, 577, 578, or 580 to a PowerPC processor?
- 3) Can I upgrade my Performa 550 to the PowerPC processor?
- 4) Can I add a floating-point unit (FPU) to my computer?
- 5) Can my Performa 580 support an Apple IIe card? Can the other 500 series computers?
- 6) Can I install the Apple TV/Video System on my Performa 500 series computer?
- 7) I accidentally lost a program that came with my Macintosh Performa. How do I get it back?
- 8) Where can I get the latest Apple software updates?

DISCUSSION -----

- 1) Question: Why can't I get a microphone from an earlier Macintosh computer to work on my Performa 500 series computer?

Answer: The microphone used with many early Macintosh computer models is called the Apple Omnidirectional Microphone. It comes with a 1/2" plug. The microphone used with the Performa 600 series computers (as well as all new Macintosh models) is called a PlainTalk microphone. It has a 3/4" plug, the extra 1/4" of which is used to reach a power source that attenuates the microphone.

The correct microphone for use with the Macintosh Performa 630 series is the PlainTalk microphone, part number M9060Z/A. You can order this through many Apple-authorized retailers and catalog resellers. Their numbers can be obtained by contacting our 24-hour referral service at 800-538-9696.

For further information on the PlainTalk microphone, consult the online Apple Technical Info Library on the Internet at <<http://til.info.apple.com/>>. Use the search string "plaintalk microphone" to locate the article "Macintosh: PlainTalk Audio Port Microphone Support".

2) Question: Can I upgrade my Performa 575, 577, 578, or 580 to the PowerPC?

Answer: The Macintosh Processor Upgrade Card (M3397LL/A, discontinued) upgrades Macintosh 570 and 580 series computers to Power Macintosh performance by replacing the 68LC040 processor with a PowerPC 601 processor.

The Macintosh Processor Upgrade Card, part number M3397LL/A (discontinued), must be installed by an Apple-authorized service provider, who can also tell you the current price. To locate an Apple-authorized service provider in your area, please call 1-800-538-9696.

For more information on the upgrade, use the Tech Info Library on the Internet at <<http://til.info.apple.com/>> Use the search string "upgrade and kppc and 575" to locate related articles.

3) Question: Can I upgrade my Performa 550 to the PowerPC?

Answer: No, the Macintosh LC/Performa 520/550 series PowerPC Upgrade (M3395LL/A) is no longer available. The upgrade was available for several months, but has since been removed from the Apple price list.

4) Question: Can I add a floating-point unit to my computer?

Answer: A floating point unit (FPU) or math coprocessor does not always give you a speed increase. An FPU is useful only when running programs that do extensive mathematical calculations that call for an FPU to be used.

If you have a Performa 550 or 560 computer, you may have a math coprocessor or floating point unit (FPU), Apple Service p/n 922-0107, installed in a special socket on the logic board. If you own a Performa 57x, the only way to add an FPU is to completely remove and replace the 68LC040 chip on the logic board. This upgrade is not available from Apple but may be available from a third party vendor. Apple does not recommend or support replacing the CPU chip.

From the online Apple Technical Info Library on the Internet at
<<http://til.info.apple.com/>> - use the search string "FPU Upgrade" to locate the
article "Macintosh Performa: FPU Upgrade Options."

5) Question: Can my Performa 580 support an Apple IIe card? Can the other 500
series computers?

Answer: The Apple IIe card is only compatible with computers that have the LC
style processor direct slot (PDS). This includes the Macintosh Color Classic,
Performa 400 series, LC/Performa 500 series computers (except the Macintosh LC
580 and Performa 580), and all Macintosh LC series computers except the
Macintosh 630 family and Power Macintosh 5200 LC and 5300 LC computers.

The Macintosh LC 580, Macintosh 630 Family, and Power Macintosh 5200 LC and 5300
LC only operate in 32-bit addressing mode. Since the Apple IIe card is not
compatible with 32-bit addressing, the Apple IIe Card is not compatible with
these computers.

From the online Apple Technical Info Library (go shortcut "TIL") - use the
search string "Apple IIe card and compatibility" to locate the article "Apple
IIe Card: Macintosh Compatibility."

6) Question: Can I install the Apple TV/Video System on my Performa 500 series
computer?

Answer: The Apple TV/Video System requires a special connection on the logic
board. This connection is available only in the Macintosh 630 series and Power
Macintosh or Performa 5200, 5300, 6200, and 6300 series of computers.

7) Question: I accidentally lost a program that came with my Macintosh Performa.
How do I get it back?

Answer: If you have lost or removed a program that originally shipped on your
Macintosh Performa, you can restore it with the program Apple Restore. This
will copy files back to your computer's hard drive. To copy the files back, you
will need backup disks. You were instructed to make a backup copy of your
programs on floppy disks when you first purchased your computer. You will need
these disks.

Using the Utilities disk which came with your computer, you can run Apple
Restore in order to restore the data. This process is described in detail in
Chapter 11 of your Macintosh User's Guide.

If your computer came with a built-in CD-ROM drive, you may not need to use the
above process. The Macintosh Performa CD contains a complete backup of all the
software which originally came with the computer. To restore this software, use
the instructions included in the small pamphlet which accompanied the CD-ROM
disc.

8) Where can I get the latest Apple software updates?

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Performa 630 Series: Frequently Asked Questions (4/97)

=====

Article Created: 2 August 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Macintosh Performa 630 series computers.

Questions in this FAQ:
=====

- 1) Is there an upgrade path for the Macintosh Performa 630 series to a PowerPC processor?
- 2) Can I add a second IDE drive or replace the original internal drive with a larger capacity IDE drive?
- 3) Can I add a DOS Compatibility card to my Performa 630 series computer?
- 4) If I purchase a Performa 630 series computer with the Apple Video TV System card installed, can I output the video to an NTSC device such as a television or VCR?
- 5) If my computer has been idle for a period of time and I move the mouse to turn off my screen saver, the computer will freeze momentarily and a beep for several seconds. Then the computer returns to normal. What is causing this symptom to occur?
- 6) How do I turn on(off) 32-bit addressing on my Macintosh Performa 630 computer?
- 7) Why is the sound from my 15" Multiple Scan Display so low?
- 8) How do I make an Emergency Disk?
- 9) The microphone from my former Macintosh computer model doesn't work on my

Macintosh Performa 630 series computer. What's wrong?

10) Can I install an Apple IIe card in my computer?

DISCUSSION -----

1) Question: Is there an upgrade path for the Macintosh Performa 630 series to a PowerPC?

Answer: The Macintosh Performa 630 series computers can be upgraded to the PowerPC using the Macintosh Processor Upgrade (discontinued). The Processor Upgrade includes a PowerPC 601 Processor with floating-point processor and 256K level-2 cache that is expandable to 1MB. The Macintosh Processor Upgrade lets you switch back and forth between the PowerPC 601 and 68040/68LC040 processors upon restart.

The Macintosh Processor Upgrade Card, part number M3397LL/A (discontinued), must be installed by an Apple Authorized Service Provider. To locate an Apple-authorized service provider in your area, please call 1-800-538-9696.

For more information on the upgrade use the Tech Info Library on the Internet <<http://til.info.apple.com/>>. Use the search string "upgrade kppc 630" to locate related articles.

2) Question: Can I add a second IDE drive or replace the original internal drive with a larger capacity IDE drive?

Answer: The Performa 630 series computer will only support only one internal IDE drive. It is possible to replace the internal IDE drive with a larger capacity hard disk, provided the drive is compatible with the computer.

To find out what features a third-party IDE hard drive must have to be compatible with a Macintosh 630-series computer, you can consult the Tech Info Library (go shortcut "TIL"). Use the search string "ide" to locate the article "Macintosh 630: Using Third Party IDE Hard Disks." Check with the maker of the specific third-party IDE hard drive to see if that model meets the criteria outlined in the article.

3) Question: Can I add a DOS Compatibility card to my Performa 630 series computer?

Answer: Apple does not make a separate DOS Compatibility Card for the Macintosh Performa 630 series computer. There are Macintosh 630 series systems available with the DOS compatibility card, but they must be purchased with the card already installed because of modifications to the logic board. You may want to check the Redgate Macintosh Product Registry (shortcut "redgate") for third-party solutions.

4) Question: If I purchase a Performa 630 series computer with the Apple Video/TV System card installed, can I output the video to an NTSC device such as

a television or VCR?

Answer: Video output to a TV or other NTSC device is handled by a separate component unrelated to the Apple Video/TV System. The Apple Presentation System (part number M2895LL/A) is an external portable device that connects to any Macintosh computer with a DB-15 standard video output port. Without the Apple Presentation System, you cannot display the video from the Performa 630 series computer to an NTSC device. A PAL version of the Apple Presentation System is also available.

5) Question: If my computer has been idle for a period of time and I move the mouse to turn off my screen saver, the computer will freeze momentarily and beep for several seconds. Then the computer returns to normal. What is causing this symptom to occur?

Answer: This is caused by the energy saver software installed on your computer. The software is designed to reduce the amount of power that your monitor is using when the computer is idle. When you move the mouse after the computer has been idle the computer will beep until the monitor has returned to full power. The energy saver control panel which is supported on the Performa 630 series computers is called Energy Saver. If you do not want to use the energy saver feature, you can de-select the appropriate option in the control panel. If you have a control panel named "Screen," remove it from your Control Panels folder since it is not supported on your computer.

6) Question: I have an old program which tells me to turn off 32-bit addressing. But I don't see this as an option in my Memory control panel. Why?

Answer: The Performa 630 always runs in 32-bit mode. There is no way to turn it off; therefore, there is no switch in the Memory control panel. You will probably need to upgrade your software.

7) Question: The sound from my 15" Multiple Scan Display is very low. Sometimes, I can hear sound only out of the left speaker. What is wrong?

Answer: Most likely, the audio patch cable is not plugged in securely on the monitor's side. Remove the cable, then plug it back in, firmly. If this does not help, completely unplug the cable from both the Macintosh side and the monitor side, then exchange the ends and plug the cable back in.

You may also wish to check your "Volumes" setting in the Sound control panel. Select "Control Panels" from the Apple menu, then open the Sound control panel. You will see a window which lets you set your alert volumes. Click on the pop-up menu at the top of the window, then select "Volumes." Make sure your speaker volume is set to a high value.

8) Question: I have a Macintosh Performa computer which shipped with a CD-ROM drive. I have purchased a third-party disk management utility or virus detector which states I should use a "Disk Tools" disk in order to create an emergency

disk. I did not receive one with my computer. Should I have?

Answer: Apple currently ships a CD-ROM drive as part of many Performa computers. The Macintosh Performa CD you received as part of your bundle, effectively replaces the usual Disk Tools floppy disk. In addition to containing conventional disk diagnostic software, the CD-ROM disc also contains a complete back-up of your system software and application programs.

In many cases, you can still use the Performa CD as a start-up disk, then insert a diskette containing whatever disk-based software you need to run.

To obtain more information on making an emergency disk, you can consult the online Apple Technical Info Library <<http://til.info.apple.com/>>. Use the search string "Performa and emergency disk" to locate the article "Performa with CD: How to Make Emergency Disk".

If the software you are using does not support the use of a Performa CD, or does not contain instructions on how to use the Performa CD with that product, you should contact the manufacturer of the software for further assistance.

From the online Apple Technical Info Library <<http://til.info.apple.com/>> - use the search string "Performa and emergency disk " to locate the article "Performa with CD: How to Make Emergency Disk".

9) Question: The microphone from myformer Macintosh computer does not work on my Performa 630 series computer. What's wrong?

Answer: The microphone used with an LC II is called the Apple Omnidirectional Microphone. It comes with a 1/2" plug. The microphone used with the Performa 600 series computers (as well as all Power Macintosh computers, the Performa 475/6, Performa 6100 series computers, 500 series computers, and Quadra 660AV and 840AV) is called a PlainTalk microphone. It has a 3/4" plug, the extra 1/4" of which is used to reach a power source that attenuates the microphone.

The correct microphone for use with the Macintosh Performa 630 series is the PlainTalk microphone, part number M9060Z/A. You can order this through many Apple-authorized retailers and catalog resellers. Their numbers can be obtained by contacting our 24-hour referral service at 800-538-9696.

For further information on the PlainTalk microphone, consult the Apple Technical Info Library <<http://til.info.apple.com/>> - use the search string "plaintalk microphone" to locate the article "Macintosh: PlainTalk Audio Port Microphone Support".

10) Question: Can I install an Apple IIe card in my computer?

Answer: Unfortunately, the Macintosh Performa 630 series computers do not support the Apple IIe card. Apple IIe card software is not compatible with the 32-bit addressing mode that your Macintosh Performa computer requires.

PowerBook Duo 2300c/100: Description (4/97)

Article Created: 2 August 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook Duo 2300c/100 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook Duo 2300c/100 is Apple's smallest, lightest PowerBook computer, delivering PowerPC processor performance in a compact, flexible, and expandable system. With complete compatibility with existing PowerBook Duo 200 series peripherals and accessories, the PowerBook Duo 2300c/100 provides advances in performance without sacrificing your investment in batteries, memory, modems, or docking solutions.

The PowerBook Duo 2300c/100 brings a new level of power and performance to subnotebook computing. It includes an integrated 9.5-inch active-matrix display that offers two modes—640 by 480 pixels with 256 colors, and 640 by 400 pixels with up to thousands of colors.

An improved Apple trackpad provides increased functionality. The PowerBook Duo 2300c/100 comes with a large hard disk drive, and its memory can be easily expanded to 56 megabytes. Its advanced 100-megahertz PowerPC 603e processor not only gives this PowerBook Duo the power to handle the most complex tasks easily, but also enables it to run Insignia Solutions SoftWindows emulation software for DOS and Windows compatibility.

With the PowerBook Duo 2300c/100, you can connect to a wide range of resources—no matter where you are. Its file-transfer options include System 7 file sharing (with LocalTalk or other serial cables), as well as a configuration with an internal Express Modem for using Apple Remote Access or other on-line

services. When you're back at the office, simply insert your PowerBook Duo computer into a PowerBook Duo Dock Plus, and you're instantly working with a complete desktop Macintosh system. And with third-party docking solutions, you can take advantage of PC Card expansion capabilities and DOS compatibility solutions.

The PowerBook Duo 2300c/100 also comes with the PowerBook Mobility Bundle, a combination of communications, compatibility, power management, security, file-transfer, and entertainment software.

In short, the PowerBook Duo 2300c/100 provides outstanding performance and innovation in the smallest, lightest PowerBook computer—making it the ideal solution for mobile computing.

Features

=====

High Performance

- Uses a 100-MHz PowerPC 603e RISC processor
- Provides Power Macintosh performance in a subnotebook computer
- Provides 8 MB or 20 MB of RAM, expandable to 56 MB
- Includes an internal 750 MB or 1.1 GB hard disk drive

Innovative New Design

- Provides a 9.5-inch (diagonal), backlit, active-matrix color display for easy viewing in up to thousands of colors
- Includes improved Apple trackpad for increased functionality
- Is the smallest, lightest PowerBook computer
- Gives you the flexibility to carry just what you need

Broad Expansion Capabilities

- Comes with a built-in serial port for peripheral devices and networking
- Includes slots for an internal modem and additional RAM
- Features a docking connector for connection to a variety of docking devices that provide desktop computing capabilities
- Provides complete compatibility with existing PowerBook Duo 200 series peripherals and accessories

Easy Communications Capabilities

- Comes equipped with Apple Remote Access and PowerTalk client software
- Is available with PowerBook Duo Express Modem

Preinstalled Software

- Comes with System 7.5
- Provides active assistance in learning new features through Apple Guide
- Comes with the PowerBook Mobility Bundle, software designed to

enhance mobile computing

Ordering Information

=====

PowerBook Duo 2300c/100

- PowerBook Duo 2300c/100 computer with 8 MB of RAM and internal 750 MB hard disk drive, Battery and AC adapter, System software version 7.5.2, PowerBook Mobility Bundle, Complete setup, learning, and reference documentation, Limited warranty
- Order No. M4220LL/A

PowerBook Duo 2300c/100

- Same as Order No. 4220LL/A, but with 20 MB of RAM, internal 1.1 GB hard disk drive, and Apple Express Modem
- Order No. M4221LL/A

PowerBook Duo 2300c/100: Technical Specifications (2/96)

Article Created: 6 July 1995
Article Reviewed/Updated: 15 February 1996

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook Duo 2300c/100 computer.

DISCUSSION -----

Microprocessor

- 100-MHz PowerPC 603e

Memory

- 8 MB of RAM, expandable to 56 MB
(Note: The 8 MB from Apple is soldered to the logic board. There is one RAM card expansion slot.)

Storage

- Internal 750 MB or 1.1 GB hard disk drive
- Optional external Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks (requires optional floppy adapter)

Display

- 9.5-in. (diagonal) active-matrix color display
- Resolution: 640 by 480 pixels with 256 colors or 640 by 400 pixels with thousands of colors

Battery

- Nickel-metal-hydride high-capacity Type III battery provides 2 to 4

hours of use before recharge

- Battery recharges in 2 hours while computer is shut down or in sleep mode, 4 hours while running
- PowerBook Control Strip lets you monitor time remaining, charge status, and battery usage

Ports

- Power adapter port
- 152-pin processor-direct slot (PDS) connector for connecting PowerBook Duo Dock Plus, PowerBook Duo Floppy Adapter, or third-party expansion devices
- Serial (RS-422) port
- Port for optional internal modem

Docking Options

- PowerBook Duo Dock Plus*
- PowerBook Duo Floppy Adapter
- Solutions from third-party vendors

* Note: The PowerBook Duo 2300c can also be used with Apple's previous docking stations: the Duo MiniDock, the Duo Dock II and the original Duo Dock. However, the original Duo Dock can only be used if the top cover has been upgraded with the user-installable Top Cover Upgrade for PowerBook Duo Dock, part number: M1814Z/A.)

File-Transfer Options

- LocalTalk cables and System 7 file sharing
- Serial cable and System 7 file sharing
- Express Modem and Apple Remote Access software
- Duo Dock with internal Apple SuperDrive, optional internal Duo Dock hard disk drive, and HDI-30 SCSI system cable
- Compact floppy adapter and external Apple SuperDrive

Networking

- Serial/LocalTalk port for AppleTalk connections to networks and printers
- Modem
- Optional internal PowerBook Express Modem; sends and receives data and faxes at 14.4 Kbps
- Includes Express Fax and OCR software (United States and Europe only)

Sound

- Sound output: Apple Sound Chip provides monophonic 16-bit sound, capable of driving stereo headphones or external speakers with the same signal supplied to both channels through optional PowerBook Duo Dock Plus
- Built-in speaker and integrated microphone
- Sound input: 4-voice mono sound with 16-bit analog-to-digital conversion, recording at 11- or 22-kHz sampling rate

Keyboard And Improved Apple Trackpad

-
- Built-in, 2.4-mm travel, 18-mm pitch keyboard, with integrated palm rests
 - Two-level tilt adjustment
 - Solid-state improved Apple trackpad lets you use the trackpad to select, open or close, and drag without using the trackpad button

Disability Access

- System software includes CloseView and Easy Access, and provides the ability to substitute visual cue for beep

Electrical Requirements

- Line voltage: 100 to 240 volts AC
- Frequency: 50 to 60 Hz

ADB Power Requirements

- Maximum current draw for all ADB devices: 100 mA with PowerBook Duo Floppy Adapter or 500 mA with PowerBook Duo Dock Plus (a maximum of three ADB devices is recommended)

Environmental Requirements

- Operating temperature: 50 degrees to 95 degrees F
(10 degrees to 35 degrees C)
- Operating temperature in Duo Dock Plus: 50 degrees to 86 degrees F
(10 degrees to 30 degrees C)
- Storage temperature: -13 degrees degrees to 140 degrees F
(-25 degrees to 60 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Size And Weight

- Height: 1.5 in. (3.8 cm)
- Width: 10.9 in. (27.7 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 4.8 lb. (2.1 kg)

Article Change History:

15 Feb 1996 - Updated sound information.

Telecom Software 2.3.2: Fax for PC Card Modems Read Me (4/97)

Article Created: 2 August 1995
Article Reviewed/Updated: 03 April 1997

TOPIC -----

This article is the Fax for PC Card Modems ReadMe file included with Apple Telecom Software version 2.3.2.

DISCUSSION -----

Fax for PC Card Modems Read Me

Apple Telecom Software
=====

This software runs on the following machines with their respective PC Card modems:

- PowerBook 500 models equipped with a PCMCIA Expansion Module and a PC Card modem. The software can be used with or without the PowerBook Processor Card Upgrade Kit with PowerPC 603e installed.
- PowerBook 5300 models using a PC Card modem.
- PowerBook 190 models using a PC Card modem.

Important information about using the Apple Telecom software

This software provides fax services for use with fax class 2-compatible PC Card modems. Before using the software you should read the Apple Telecom Installation file that comes with it.

Supported Modems

The Apple Telecom software should be compatible with most fax class 2-compatible PC Card modems. The software has been specifically tested for compatibility with

the cards listed below:

- COM1-MC217 and MC218 models.
- PNB-Danube V32bis and Danube V34 models.
- TDK-DF2814 model.

Check with your Apple-authorized service provider to verify if a particular card is compatible with the software.

AppleTalk and modem use

If you are connected to an AppleTalk network, you may get better fax transmission performance if you turn off AppleTalk in the Chooser.

Apple Remote Access use

CCL (connection control language) script files for Apple Remote Access are provided for most popular modems are installed with your system software or your Apple Remote Access software (in the Extensions folder in the System folder). Additionally, an Apple Remote Access CCL, "PC Card Modems ARA 2.0", is installed in the Telecom Documents folder when you install your Apple Telecom software. To use it, you need to drag it to the Extensions folder. This CCL has been tested with the PC Card modems listed above. If it does not work correctly with your modem, you may be able to use one of the other CCL files that is already in your Extensions folder.

If you are using the TDK DF2814 Card, use the TDK DF2814 ARA 2.0 modem file.

What goes where

When you install the Apple Telecom software using the Easy Install option of the Installer program, the following files are installed on the hard disk of your choice.

Hard Disk:

- Fax for PC Card Modems Read Me
- Apple Telecom Installation
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- PC Card Modems•Alink (AppleLink CCL)
- PC Card Modems ARA 2.0 (Apple Remote Access 2.0 CCL)
- TDK DF2814•Alink (AppleLink CCL)
- TDK DF2814 ARA 2.0 (Apple Remote Access 2.0 CCL)

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Fax Extension
- Fax Sender
- Fax Sender GX
- PCMCIA Class2
- Serial Tool

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: Apple Menu Items:

- Fax Terminal (alias of Fax Terminal)

Apple Telecom Installation

=====

Installing the Apple Telecom Software for use With PC Card Modems

This document provides information on installing the Apple Telecom software that comes on your computer, and in accessing the Fax & Telephony Solutions User's Guide that you will need to use the software. You may want to print this document to keep with your user's manual.

Discovering the Apple Telecom software

The Apple Telecom software brings a complete set of fax functions to your desktop. This document tells you how to install and configure it for use with a PC Card modem. The software is designed to work with most class 2-compatible PC card fax modems and has been tested with a number of different cards. Check with your Apple-authorized service provider to verify if a particular card is compatible with the software.

Before you begin

Make sure that you are familiar with the basic operation of your Macintosh. If you are not familiar with the basic concepts, go through the Macintosh Tutorial to learn the basics. See Chapter 1 of the user's manual that came with your PowerBook for instructions on taking the Macintosh Tutorial.

Accessing the Fax & Telephony Solutions User's Guide

The documentation for the Apple Telecom software is included in a file called "Fax & Telephony User's Guide" in the Fax Software Install folder (in the Apple Extras folder) on your computer's hard disk. To print this file, connect your PowerBook to a printer and follow these steps:

Step 1

Open the Apple Extras folder.

Step 2

Open the Fax Software Install folder inside the Apple Extras folder.

Step 3

Double-click the Fax & Telephony User's Guide icon.

The cover of the manual appears on your screen.

Step 4

Choose Print from the File menu.

What you need

In order to send and receive faxes using the Apple Telecom software and a PC card modem, you need the following materials:

- a Macintosh model with built-in PC card slots or PCMCIA Expansion Module
- the Apple Telecom software
- a PC Card modem that is fax class 2-compatible
- the appropriate connector cable between PC Card modem and telephone line (furnished with your modem card)
- the Serial Tool connection tool (comes with your computer's system software and is in the Extensions folder inside the System Folder)

Installing the hardware

You need to install the modem card and connect it to the telephone line in order to use your Apple Telecom software.

1. Insert the modem card into either the upper or lower card slot.

If you do not know how to install a card, refer to the manual that came with your computer.

2. Connect the modem card to the telephone line using the appropriate cable. The cable should be provided with your PC Card modem.

Refer to the documentation that came with your modem card for information on how to connect it to the telephone line.

Installing the software

This section tells you how to install the software you need to send and receive faxes.

The Apple Telecom software is in the Apple Extras folder on your hard disk. You need to run the Installer application program included with the Apple Telecom software before using it with your PC Card modem. The Installer places all the files you need in the appropriate places on your hard disk.

To install the software:

Step 1

Open the Apple Extras folder.

Step 2

Open the Fax Software Install folder inside the Apple Extras folder.

Step 3

Double-click the Installer program icon.

Step 4

If the hard disk that you want to install the software onto is not selected, click Switch Disk until the correct hard disk appears.

Step 5

Click Install.

The Installer places all the files needed to use the Apple Telecom software in the appropriate places on your hard disk.

Step 6

When the Installation is complete, click Restart.

When your Macintosh restarts, you'll have everything you need to begin using the fax functions of the Apple Telecom software.

Setting preferences for the fax software

Once you have completed the hardware and software installations described above, you can quickly get started using some of the features of your Apple Telecom software. In order to use your Apple Telecom software for fax send and receive functions, you need to configure Fax Terminal for your hardware setup.

To configure Fax Terminal:

Step 1

Choose Fax Terminal from the Apple menu.

Step 2

Choose Preferences from the Fax menu.

The Fax Terminal Preferences dialog box appears.

Step 3

Choose PCMCIA Class 2 from the Modem Select pop-up menu.

Step 4

Choose the slot (upper or lower) that contains your modem card from the Port Select pop-up menu.

This configuration allows the Apple Telecom software to work with most available PC card modems, provided that they are fax class 2-compatible. The first chapter of the Fax &Telephony Solutions User's Guide also covers these configuration steps and shows you how to send your first fax. If you have a problem using your modem, recheck the installation of your PC card and then go through the configuration steps again.

For more information on using the Apple Telecom software, refer to Chapters 1 through 6 of the Fax &Telephony Solutions User's Guide.

Power Macintosh 6100 Series: Frequently Asked Questions (11/95)

Article Created: 30 July 1995
Article Reviewed/Updated: 14 November 1995

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Power Macintosh 6100 series computers.

Questions in this FAQ:
=====

- 1) What is the difference between native software and conventional software?
- 2) My computer does not remember sound settings from restart to restart. I continually have to go back to the Sound control panel and reset the CD input source.
- 3) What causes Type 11 errors?
- 4) Does my Power Macintosh have an FPU (Floating Point Unit/Math coprocessor)? I see errors that an FPU is not installed.
- 5) I need to run DOS software on my Power Macintosh 6100 series computer. What are my options?
- 6) The microphone from my former Macintosh computer model doesn't work on my Power Macintosh 6100 series computer. What's wrong?
- 7) I have an old program that tells me to turn off 32-bit addressing, but I do not see this as an option in my Memory control panel. Why?

DISCUSSION -----

- 1) Question: What is the difference between native software and conventional software?

Answer: The Power Macintosh runs in two modes, without any further assistance from the user: it can run "native" software, which is software written for the PowerPC chip, or "conventional" software, which is software written for an older 68000, 68020, 68030, or 68040-based computer. Conventional software is sometimes referred to as "68K" software.

Conventional software runs in an "emulation" mode, which is functionally similar to the 68020 processor. The main differences between the 68020 processor and later processors are: (a) it does not have a PMMU (Paged Memory Management Unit), (b) it does not support the SWAP16 instruction, and (c) it does not support a floating point unit. The first point is necessary because the PowerPC has a newer, better, memory management model. The second point is also addressed by improvements in the PowerPC chip. The third point requires different steps to work around; see the FAQ question below. Conventional software will generally run faster than a 68020, probably between Macintosh IIci and Quadra 605 performance, depending on how many references the software makes to the native "toolbox" in the computer.

As new software is sold, you will find reference to "Fat" applications. These are programs that can be run on either a 68K or Power Macintosh computer without modification. The operating system automatically determines which part to use.

Since "Fat" applications are really two programs in one, many installers will offer either a "Power Macintosh" or "Conventional" install. If you have installed a software billing itself as "Accelerated for Power Macintosh" and, once installed, it does not recognize features which definitely exist, such as an FPU, make sure you have installed the correct version and build. Both versions will run on the Power Macintosh, but only the "native" version will benefit from all the special features of the Power Macintosh.

2) Question: My computer does not remember sound settings from restart to restart. I continually have to go back to the Sound control panel and reset the CD input source.

Answer: If the Sound Preferences file, which stores much of this information, is corrupted, the settings may not be getting saved. To resolve this, open your System Folder, then your Preferences folder. Throw away Sound Preferences, and restart. Try to reproduce the problem.

If you have installed any type of disk compression or disk management software, check to make sure that it is not manipulating any of your Preferences files.

3) Question: What causes Type 11 errors?

Answer: Type 11 errors are typically due to one of a variety of factors:

- Font problems: you are using a bad font.
- RAM problems: you have install bad RAM.
- SCSI chain problems: bad driver or cable.
- Cache SIMM problems (if you have installed one on your Power

- . Macintosh computer).
- Incompatible software running in emulation.

For steps on how to troubleshoot such problems, see the referenced Technical Information Library article.

The online Apple Technical Info Library (go shortcut "TIL") - use the search string "meaning of error type 11 and power macintosh" to locate the article "Power Macintosh: Meaning of Error Type 11".

4) Question: Does my Power Macintosh have an FPU? I see errors that an FPU is not installed.

Answer: All PowerPC chips, which are used on Power Macintosh computers, have a floating point unit.

You may be seeing the "FPU not installed" error for two reasons:

- You are running "conventional" software in 68K emulation. This operating mode does not provide access to the computer's floating point unit. Thus, the program does not work. Certain software "bridges" exist to allow conventional software access to the PowerPC microprocessor's FPU. See the Redgate Communications area to search for such products.
- You are using software, in either emulation or native mode, which is simply failing. Since the PowerPC supports pipelining instructions, a number of errors are occurring simultaneously. They are eventually percolating out as an "FPU not installed" error. An error did occur, but it has nothing whatsoever to do with the need for a floating point unit. You should apply standard troubleshooting steps to resolve this issue.

5) Question: I need to run DOS software on my Power Macintosh 6100 series computer. What are my options?

Answer: There are two ways to run DOS software:

- Use Insignia Solutions' SoftWindows emulator. This is a Macintosh application which emulates a PC DOS/Windows environment. You can get more information, such as pricing, performance, system requirements, and compatibility information from Insignia Solutions by calling the company at 800-848-7677.
- You can use the Apple DOS Compatibility Card. This is a hardware solution, that provides a 486 DX2 processor running at 66 MHz, SoundBlaster support, alternative video support, and up to 32 MB of on-board memory. This effectively produces a "dual processor" environment for your computer, in which Macintosh and DOS applications can run at full processor efficiency, simultaneously.

This card plugs into your single Processor Direct Slot. If you opt to use this card, you will not be able to use other PDS cards, such as an Apple AV Technologies Card, without removing this card, first.

The Apple part number for the DOS Compatibility Card is M3581LL/A. You can order one from any Apple-authorized reseller or Apple-authorized service provider, who can also tell you the current price. To find an Apple-authorized reseller or service provider near you, please call 800-538-9696.

6) Question: The microphone from my former Macintosh computer model doesn't work on my Power Macintosh 6100 series computer. What's wrong?

Answer: The microphone used with many early Macintosh computer models is called the Apple Omnidirectional Microphone. It comes with a 1/2" plug. The microphone used with the Performa 600 series computers (as well as all Power Macintosh computers, the Performa 475/6, Performa 6100 series computers, 500 series computers, and Quadra 660AV and 840AV) is called a PlainTalk microphone. It has a 3/4" plug, the extra 1/4" of which is used to reach a power source that attenuates the microphone.

The correct microphone for use with the Power Macintosh 6100 series is the PlainTalk microphone. Our part number is M9060Z/A. You can order this through many Apple-authorized retailers and catalog resellers. Their numbers can be obtained by contacting our 24-hour referral service at 800-538-9696.

For further information on the PlainTalk microphone, consult the online Apple Technical Info Library (go shortcut "TIL"). Use the search string "plaintalk microphone" to locate the article "Macintosh: PlainTalk Audio Port Microphone Support".

7) Question: I have an old program that tells me to turn off 32-bit addressing, but I do not see this as an option in my Memory control panel. Why?

Answer: The Power Macintosh always runs in 32-bit mode. There is no way to turn it off; therefore, there is no switch in the Memory control panel.

Power Macintosh 7200/7500/8500: New Items in Sys Folder 11/95

Article Created: 03 August 1995
Article Reviewed/Updated: 20 November 1995

TOPIC -----

This article lists the updated Apple software components on the new Power Macintosh 7200, 7500 and 8500 computers in comparison to standard System 7.5 components. The new components of System 7.5.2 are designed to run on these Power Macintosh computers only.

The TIL article "Apple Software: Current Versions" will be updated as appropriate as future releases of our system software are made available.

"n/a" - not applicable

"-" - no version number

Apple Personal Diagnostics 1.1.3 Updater: ReadMe File (8/95)

=====

Article Created: 04 August 1995

TOPIC -----

This article contains the Read Me file included with the Apple Personal Diagnostics Updater 1.1.3 program available from online services.

DISCUSSION -----

This file provides step-by-step instructions on how to apply the APD 1.1.3 update to your copy of Apple Personal Diagnostics. There are two parts to updating Apple Personal Diagnostics: both the Apple Personal Diagnostics application and the APD Emergency application need to be updated.

If you have a problem launching one of the updater applications because there is not enough memory, you may want to reboot your machine with extensions turned off. To do this simply hold down the Shift key on your keyboard during the boot process.

Apple Personal Diagnostics

To update the Apple Personal Diagnostics application use the file APD 1.1.3 Updater. This application will update Apple Personal Diagnostics versions 1.1 or 1.1.1 to the latest release version 1.1.3. This document provides the step-by-step procedure on how to update your copy of Apple Personal Diagnostics.

Important: Do NOT use this application to update your original disk! Always work with a copy.

1) Use either the Search button or the Select File... button to locate your copy of Apple Personal Diagnostics to be updated. Search will scan your disk automatically and locate any copies of Apple Personal Diagnostics. Select File... will present a standard Open dialog which lets you navigate to your copy of Apple Personal Diagnostics.

The file(s) found will then appear in the scrollable area above the buttons.

- 2) Select the file you want to update from the scrollable list.
- 3) Click the Update button.
- 4) Once the update process is complete, a dialog saying "The file has been successfully updated" will appear.
- 5) Click the Quit button.

Your copy of Apple Personal Diagnostics is now updated to version 1.1.3.

- 6) Launch the updated copy of Apple Personal Diagnostics to make sure it's working correctly.

If there are any problems you can recover your old copy of Apple Personal Diagnostics from the Trash. If you have updated more than one copy of Apple Personal Diagnostics, there may be multiple copies in the trash. The file name "Apple Personal Diagnostics" is the copy you just updated.

APD Emergency

To update the APD Emergency application use the file APDE 1.1.3 Updater. This application will update APD Emergency versions 1.1 or 1.1.1 to the latest release version 1.1.3. This document provides a step-by-step procedure on how to update your copy of APD Emergency.

Important: Do NOT use this application to update your original disk! Always work with a copy.

- 1) Locate the correct APD Emergency disk for your computer. Use the instructions that follow to make a copy of this disk.
- 2) Launch Disk Copy 4.2.
- 3) Lock your APD Emergency disk and then insert it into your floppy drive.
- 4) Click on the Read Master Floppy button. Disk Copy will read the files from your disk into memory. When it's complete your disk will be ejected.
- 5) Now click on the Make A Copy button. Disk Copy will flash the message "Please insert a disk to COPY ONTO...". Insert a new blank disk into your floppy drive. (Use a blank disk because anything on this disk will be erased. If the disk has been used previously, a dialog asking if you want to erase this disk will appear.)
- 6) Click the Duplicate button. When the copy is complete the disk will be ejected.
- 7) Label the disk appropriately and quit the Disk Copy program.
- 8) Create a folder on your hard drive called "APDE".
- 9) Insert the new disk you just created back into the floppy drive.

10) Copy the file APD Emergency from the floppy to the APDE folder on your hard drive.

11) Launch the APDE 1.1.3 Updater application.

12) Use the Select File... button to locate your copy of APD Emergency to be updated. Select File... will present a standard Open dialog which lets you navigate to your copy of APD Emergency.

The file selected will then appear in the scrollable area above the buttons.

13) Click the Update button.

14) Once the update process is complete, a dialog saying "The file has been successfully updated" will appear.

15) Click the Quit button.

16) Now copy the file APD Emergency from the APDE folder on your hard drive to the floppy still in your floppy drive.

17) When asked if you want to replace the existing file, press OK.

18) Drag the APDE folder on your hard drive into the trash.

Your copy of APD Emergency is now updated to version 1.1.3.

19) In order to verify that the updated copy of APD Emergency is working correctly, boot your computer from the new APD Emergency disk and run the tests. If there are any problems, repeat the above process again.

Apple Personal Diagnostics 1.1.3: ReadMe File (8/95)

Revised: 8/4/95
Security: Everyone

Apple Personal Diagnostics 1.1.3: ReadMe File (8/95)

=====

Article Created: 04 August 1995

TOPIC -----

This article contains the Read Me file included with Apple Personal Diagnostics 1.1.3.

DISCUSSION -----

APPLE PERSONAL DIAGNOSTICS 1.1.3

The purpose of this document is to provide late-breaking information as a supplement to the Apple Personal Diagnostics User's Guide. Please refer to the User's Guide for operating instructions and other important and time-saving troubleshooting tips when using Apple Personal Diagnostics (APD). Also, be sure to fill out and return your software registration card so that Apple can notify you of future upgrades to APD 1.1.3 as they become available.

System Requirements

APD 1.1.3 runs on Apple computers starting with the Macintosh Plus and is fully compatible with system software versions 6.0.7 through 7.5.2 (including Performas system software). Installing and using the Automated Diagnostics functionality of APD 1.1.3 requires that your system is running system software version 7.0 or greater.

What's New

APD 1.1.3 includes the following changes and enhancements:

- APD 1.1.3 is required for the recently released Power Macintosh 9500 series computers. If you attempt to run previous versions of APD on any Macintosh with the new PCI-bus architecture (which has replaced NuBus), APD will give false RAM Test results and may crash. Note that APD 1.1.3 will not display PCI-bus information in the "Video and Expansion Cards" window of the System Info screen and will not test VRAM installed in a Power Macintosh computer.

- APD 1.1.3 now supports over 140 Macintosh computers. (See the "Computers Supported by APD" file on the Application Disk for a complete listing.)
- The two emergency disks included with APD 1.1.3 continue to provide startup and emergency repair software for most Macintosh computers, but not Macintosh computers which require MacOS 7.5.1 or 7.5.2. (See "Creating New Emergency Disks" later in this document for a complete list of the exceptions.)
- The option settings allowed by APD 1.1.3 (such as turning test selections on or off) are now saved in the preferences file, so that you do not have to reset these options each time you run APD.
- APD Emergency 1.1.3 has a new on-screen log window which displays the status and results of diagnostic tests, as well as additional hardware information.
- The APD Emergency 1.1.3 bootable disks contain the international version of the MacOS. When you boot from an APD Emergency disk, the international time and date formats will appear in the on-screen log window.
 - Time will be displayed using a 24-hour clock (instead of a 12-hour clock which is more common in the United States). For example, "13:23" is the equivalent to "1:23 pm".
 - Dates will be displayed in the DD/MM/YY format (instead of MM/DD/YY). For example, "02/03/95" is equivalent to "March 2, 1995" rather than "February 3, 1995".If you prefer to use another time and date format, please see "Creating New Emergency Disks" to create an emergency disk using the System Software from Apple Macintosh CD or Disk Tools disk that came with your Macintosh computer.
- APD 1.1.3 and APD Emergency 1.1.3 now display the location of duplicate System Folders and corrupted System files found by the System Software test.
- APD 1.1.3 now supports file checking and directory structure repair of larger volumes (over 2 GByte).
- The System Software test in APD 1.1.3 and in APD Emergency 1.1.3 will now only run once, even if it is selected as one of a suite of tests for looping. This allows more time for tests where looping is effective in finding intermittent problems.
- When you launch APD Emergency 1.1.3 from a floppy, the System Software test now deselects the floppy drive by default. (There is generally no reason to run the System Software test on the APD Emergency disk.)
- APD 1.1.3 and APD Emergency 1.1.3 System Software test now also checks for duplicate System Folders on non-boot drives.
- APD 1.1.3 and APD Emergency 1.1.3 now limits the looping of tests to a maximum of 24 hours.

Installation Instructions

1. Insert the Application Disk into your floppy drive.

2. Drag the APD application icon from the floppy drive onto your hard drive.
3. To install the Automated Diagnostics (System 7 or later only), drag the Automated Diagnostics system extension from the floppy drive onto the closed System Folder of your hard drive. Allow the system software to place the extension in the proper folder (the Extensions folder within the System Folder).

In most cases, you'll want to start up your computer and run APD from your computer's hard drive.

File Sharing Alert

Turn off File Sharing before you start the APD application. If File Sharing is on, you will receive an on-screen alert or see dimmed selection buttons. To switch File Sharing off, go into the Sharing Setup control panel and click on the stop button.

Turn Off Extensions, Applications, and Other Programs

For best results, start your system with all extensions, applications, and other programs off before launching APD (or use an extensions manager to disable extensions at startup).

To turn extensions off, shut down your system, then switch on the system while holding down the Shift key (System 7.0 and later). You should then see a message saying "Welcome to Macintosh, Extensions Off." To perform the equivalent operation on a computer running System 6.0.7 or 6.0.8, please refer to the "Software Remedies" section in the Troubleshooting chapter of the Apple Personal Diagnostics User's Guide.

There is a known conflict between APD and Thunder 7 spell checking software from Baseline Publishing. Before using APD or APD Emergency, use the Thunder 7 control panel to turn off spell checking.

Using the Emergency Disks

This package contains two emergency disks that allow you to perform certain system software repairs and to boot from a floppy disk when you are unable to boot from your system's hard drive. Each disk provides the APD Emergency application, as follows:

APD Emergency Disk 1 is a 1.4 MB bootable startup and repair disk for most Macintosh computers with a 1.4 MB floppy drive released through January 1995 (excluding Workgroup Server 9150 computers, computers in which the Macintosh Processor Upgrade card is installed, and computers requiring System Software 7.5.1 or 7.5.2).

Note: To create emergency disks for these computers see "Creating New Emergency Disks" below.

Note: If you have installed a Power Macintosh Upgrade Card, you can use APD

Emergency Disk 1 to start your Macintosh computer with the Power Macintosh Upgrade Card on or off at startup. However, if you have a problem, you may want to reset PRAM first and then use APD Emergency Disk 1 to boot your computer. (Refer to the "Software Remedies" section in the Troubleshooting chapter of the Apple Personal Diagnostics User's Guide for instructions on resetting PRAM.)

APD Emergency Disk 2 is an 800K bootable startup and repair disk providing the APD Emergency application for Macintosh computers that did not originally come with, or were not upgraded to include, a 1.4 MB floppy drive (Macintosh Plus, SE, SE/30, II, IIfx, and IIfx computers).

The system software on these disks has been minimized to reduce disk requirements. Do not use the software on these disks to install system software on your computer's hard drive. Also, make copies of the original disks to use when you need to start your computer from an emergency disk, and keep your original disks in a safe place. Please refer to the "Getting Started" section of the Apple Personal Diagnostics User's Guide for detailed instructions on the proper use of these disks.

Creating New Emergency Disks

Workgroup Server 9150 computers, computers with the Macintosh Processor Upgrade card installed, and computers requiring System 7.5.1 or 7.5.2 require different system software from that provided on APD Emergency Disk 1. To make an emergency startup disk for these computers:

1. Insert the Apple Macintosh CD or Disk Tools disk that came with your computer or Processor Upgrade Card. Create a temporary folder named Emergency Disk on your computer's hard drive and copy the System file and the System Enabler file from the Apple Macintosh CD or Disk Tools disk to the Emergency Disk folder. Eject the Apple Macintosh CD or Disk Tools disk.
2. Insert APD Emergency Disk 1 and copy the APD Emergency application to the Emergency Disk folder. Then eject the APD Emergency Disk 1.
3. Format a 1.4 MB floppy disk and label the disk APD Emergency Disk. Optionally, you may want to add your computer's model name to the label.
4. Copy the System file, the System Enabler file, and the APD Emergency application file from the Emergency Disk folder to the new emergency disk.
5. On the floppy disk, rename the APD Emergency application to Finder. (Changing the application's name to Finder lets you start up using the APD Emergency application instead of the System Finder.)
6. Eject the new emergency disk and lock the disk. Drag the Emergency Disk folder on your computer's hard drive to the Trash and empty the trash (select Empty Trash from the Special menu).
7. Check the new emergency disk you've created to make sure that your system boots correctly and that you can run the APD emergency application from the new disk.

Automated Diagnostics

Installing and running the Automated Diagnostics functionality of APD software requires that your system is running System Software version 7.0 or greater. The startup delay for Automated Diagnostics has been set to 20 minutes (default).

Certain extensions and third-party software programs that perform functions considered to be system activities may prevent Automated Diagnostics from starting up. Also, some third-party utilities may interfere with Automated Diagnostic's operation.

Automated Diagnostics runs in non-native or emulation mode on Power Macintosh computers, so it does not perform an FPU test (since Power Macintosh emulation does not provide FPU functionality).

Automated Diagnostics may erroneously report problems with drives that support removable media, if the media is removed after the Macintosh is booted.

Help Window

The default setting for the Help window is to have it hidden from view. You can activate the Help window from the Windows menu in the Menu bar. Note: In addition to hiding and showing the Help window, you can move it or change its size to suit your preferences.

Accelerator Cards

If you've installed a third-party accelerator card, you may want to remove or disable the card before running APD to avoid possible incompatibilities.

Video Mirroring

Turn off video mirroring before running APD.

RAM Test Conflicts

Turn off virtual memory and disable RAM optimization utility applications before you run APD RAM tests. (Some RAM optimization utility applications cause your system to behave as if virtual memory were on. The virtual memory setting in your system's Memory control panel cannot disable these applications.)

Low-Memory Alerts

APD returns a low-memory alert when it does not have enough memory to run or is running low on memory, for example, if you've created a report that requires more memory than is currently available. To allocate more memory to the APD application, you can do one or more of the following:

If you are using System 7, or System 6 with MultiFinder:

- Quit other applications that may be running at the same time as APD.
- If you have sufficient RAM installed in your system, quit the APD application,

open the APD Get Info box and increase the "preferred" application memory size to 1500K. (The application memory size is initially set to 1200K.)

- Close any open report.
- Reduce the size of any installed RAM disk and the system RAM cache.

If you are using System 6 with Finder rather than MultiFinder:

- Close any open report.
- Reduce the size of any installed RAM disk and the system Disk cache.

AppleTalk Zones

Under certain conditions (for example, during periods of heavy network activity) System Information may report an AppleTalk zone to be "Unknown."

System Info and Partitioned Hard Drives

The SCSI Device display in System Info does not provide information on multiple drive partitions. Typically, the display lists the name of a single partition on the drive corresponding to the SCSI device, however, the exact information that appears depends on the software used to partition the hard drive.

Looping the Floppy Drive Test

Running the Floppy Drive test for more than approximately 50 loops can cause the floppy drive to temporarily overheat and induce a test failure.

Power Macintosh Upgrade Cards

Basic Info identifies the CPU type as Power Macintosh when a computer with a Power Macintosh Upgrade or Macintosh Processor Upgrade card is operating in "Power Macintosh" mode; however, the card does not appear in Video and Expansion Card Information displays.

Creating Report Log Files

Using APD 1.1.3, you can create log files and then reload them later to compare with updated reports. Due to changes in the information included in reports, APD 1.1.3 cannot read log files created by APD 1.0.

Basic Info Reporting of Startup Devices

Basic Info lists the startup device selected in the Startup Disk control panel when APD was launched. If no device is selected in the Startup Disk control panel, or if you've disconnected (or unmounted) the original startup device, Basic Info will not reflect the current setting or may report it as an unknown device.

If you run System Software Check on the boot disk before you run System Info, then the Basic Info screen may report the startup device as an unknown device.

Benchmark Check Results

The results you get from running Benchmark checks may vary, depending on a range of different factors (see the User's Guide for more information). Therefore, you can obtain more accurate and consistent comparisons if you run Benchmark checks several times, and then average the results.

The results of the Individual Checks reflect the true speed of your system compared to a Macintosh computer chosen by you from the pull-down menu. The Overall Check graph, on the other hand, is a performance ratio that uses a relative scale of zero to 150 (or zero to 2000 on a Power Macintosh), where a Macintosh Plus equals 1. For example, if the score for your computer is 80, then you can infer that, overall, your computer is 80 times faster than a Macintosh Plus. All scores are relative to a Macintosh Plus.

Benchmark results may be affected by currently active applications and whether you are using FPU emulation software, video mirroring, accelerator cards, virtual memory, RAM optimization utilities, etc. Turn off all of these items before running APD to obtain more accurate and consistent results from the Benchmark checks.

On Macintosh Centris AV and Quadra AV computers, there is a known conflict between the Benchmark FPU checks and Express Modem software. Disable the Express Modem extension before running Benchmark checks.

Display Patterns

For a PowerBook with an external display, the Display Patterns Test uses patterns designed for an LCD display on the external monitor, rather than the specific patterns that would otherwise appear.

When using System 7.5 or third-party clock utilities, the clock may appear when test patterns display on your screen. The clock does not affect the operation of the Display Patterns checks.

Apple Media Kit: Spinning Cursor Issue on Power Macintosh 6/96

Revised: 5/23/96
Security: Everyone

Apple Media Kit: Spinning Cursor Issue on Power Macintosh 6/96

=====

Article Created: 4 August 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

When I launch an Apple Media Tool (AMT) project on a Power Macintosh 7200, 7500, 8500, or 9500 running System 7.5.2 with a PowerPC 604 processor, it crashes with a Type 11 error or I get a spinning cursor and the machine hangs.

This same hang occurs with my finished project when launched from its CD-ROM disc.

DISCUSSION -----

At this time, there are different solutions for what is known as the "AMK Spinning Cursor Bug" depending whether you are a user or developer. The solutions have been posted to Apple Online SW Update areas.

This issue can occur when a media application created with the Apple Media Tool is run on any Power Macintosh or PowerBook computer with System 7.5.2. The symptom is you have just clicked to go to a new screen (or launched an AMK (Apple Media Kit) program) and the computer hangs. The problem is caused by the spinning color cursors that AMK uses to indicate that processing is occurring.

The three solutions below address different audiences:

Solution 1 - for developers

Developers with existing titles should distribute the "AMK Launch'Nplay" application to customers who report crashes. Double-click the AMK Launch'Nplay application to use it, you will then be prompted with a standard get-file dialog. Navigate to your AMK application and open it. The title will be launched and will not crash -- you will notice there are no spinning cursors. You must use AMK Launch'Nplay to open a title EVERY TIME you want to play it. AMK Launch'Nplay will not run on non-PowerPC-based computers because it is only required for PowerPC-based computers.

Solution 2 - for developers

If you are an Apple Media Tool developer currently working on titles, use the "PROGRAM" file from the Apple Online SW Update areas. This is a replacement for one of the files in the AMT:Runtime Maker:CODES folder. Drag this new version to the folder and replace the old PROGRAM. Rebuild any titles you are currently working on.

Solution 3 - for programmers

If you are an Apple Media Tool Programming Environment user, replace the cursor.c file in your key:RUNTIME folder with the one from the Apple Online SW Update areas.

Solution 4 - for end users

If you are trying to use a media title such as a CD-ROM disc, and you are experiencing the symptoms described above on a Power Macintosh computer, download the AMK Spinning Cursor Bug Fix available from online services. Double-click the included AMK Launch'NPlay application to use it, you will then be prompted with a standard get-file dialog. Navigate to your AMK application and open it. The title will be launched and will not crash, you'll also notice there are no spinning cursors. You must use AMK Launch'NPlay to open a title EVERY TIME you want to play it.

Please contact AppleLink: DEVSUPPORT if you experience any problems with any of these solutions.

These articles can help you locate the AMK Spinning Cursor Bug Fix mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

AppleShare Client for Windows: Fax Through Ethernet (8/95)

=====

Article Created: 7 August 1995

TOPIC -----

Is it possible to fax from a PC running AppleShare Client for Windows to a LaserWriter 16/600 PS through an Ethernet card?

DISCUSSION -----

No. Faxing is done via the PSFax software, that ships with the LaserWriter 16/600 PS, which looks for a serial or parallel port.

AppleShare Client for Windows & Intel Ethernet Pro Card (8/95)

=====

Article Created: 7 August 1995

TOPIC -----

This article describes an installer Problem on PCs which have the Intel Ethernet Pro Card.

DISCUSSION -----

During the installation process, if the workstation has an Intel Ethernet Pro network interface card, the installer omits a necessary parameter for the AARP protocol. This necessary parameter is the network number. Manually edit the NET.CFG file and insert the 80F3 address as follows:

The affected line reads:

PROTOCOL AARP ETHERNET_SNAP

It should read:

PROTOCOL AARP 80F3 ETHERNET_SNAP

MacX 1.5: Product Description (9/95)

Revised: 9/22/95
Security: Everyone

MacX 1.5: Product Description (9/95)

Article Created: 7 August 1995
Article Created: 21 September 1995

TOPIC -----

This article describes MacX 1.5.

DISCUSSION -----

MacX software from Apple Computer delivers high-performance X Window computing for Macintosh and other Mac OS-based systems. This easy-to-use software helps increase users' productivity by enabling them to run both Macintosh applications and network-based X client applications on one Macintosh computer.

MacX enables a Mac OS-based computer to act as an X Window System display server. It supports the latest widely adopted standard for the X Window System: Version 11, Release 5 (X11R5). MacX 1.5 is optimized for accelerated performance on Power Macintosh computers while maintaining high performance on 680x0-based Macintosh systems.

With MacX, software developers, engineers, scientists, higher-education faculty and students, support personnel, and other users can access the rich application and development environments of network-based UNIX and VMS systems without sacrificing the productivity of the Mac OS environment.

With MacX, you can run X Window applications including OSF/Motif, OpenLook, and DECWindows programs at the same time as your familiar Macintosh applications. And MacX extends popular Macintosh features to the X Window System. For example, you can customize the software so that you can launch frequently used X Window applications simply by choosing commands from pull-down menus.

Support for multiple network protocols allows MacX to use all major X Window protocols, including TCP/IP, DECnet, and AppleTalk.

Features

Compatibility

- Support for X11R5
- Access to all X Window client applications, including OSF/Motif, OpenLook, and DECWindows
- Seamless integration between Macintosh and X Window applications
- Extensive font capabilities including font server, XLFD, and R6 font support
- Support for login via xdm/xdmcp or rsh/rexec

High performance

- Accelerated for Power Macintosh systems
- Industry-standard Backing Store/Save Under capabilities

Ease of use

- One-button installation
- Full support for Macintosh System 7 user-interface features
- Ability to copy and paste text and PICT files between X Window and Macintosh applications
- Customizable pull-down menus

System 7.5 Update: Startup Chime is Too Loud (8/95)

Revised: 8/7/95
Security: Everyone

System 7.5 Update: Startup Chime is Too Loud (8/95)

=====

Article Created: 07 August 1995

TOPIC -----

I just upgraded my Macintosh computer to System 7.5.1. Now when I restart the startup chime is extremely loud.

DISCUSSION -----

The System 7.5 Update 1.0 sets the alert volume to maximum during installation. Follow these steps to lower the alert volume:

Step 1

Under the Apple menu, choose Control Panels.

Step 2

Double-click on the Sound control panel.

Step 3

From the pull down menu, choose Volumes.

Step 4

Use the slider bar to adjust the sound to a desired level.

If you have a Macintosh Centris/Quadra 660AV or Quadra 840AV, some system alert sounds may not play correctly with the Alert Volume turned down. In these cases you will have to keep it at full volume.

Finder: Black Apple Menu and Colored Desktop? (8/95)

Revised: 8/7/95
Security: Everyone

Finder: Black Apple Menu and Colored Desktop? (8/95)

=====

Article Created: 07 August 1995

TOPIC -----

My Apple in the upper left corner of my menu bar is black. The rest of my desktop is in color. What is wrong?

DISCUSSION -----

This happens on Macintosh computers that can support 16, or 24 bit color. If you select the grays radio button in the Monitors control panel, the Apple will display solid black because of guidelines for displaying the Apple logo.

The reason that the rest of the screen is not in shades of gray, is because in addition to having selected grays, you have also set the control panel to either thousands or millions of colors. Since there are only 256 grays available to the system, everything over the 256 grays is displayed in color.

MicroPrint: Ethertalk Adaptor for LaserWriter 360 Specs (8/95)

Article Created: 07 August 1995

TOPIC -----

This article contains the specifications for MicroPrint, the Ethertalk adaptor sold by Apple under part number T1556LL/A.

DISCUSSION -----

MicroPrint - LocalTalk to EtherTalk Hardware Bridge

- EtherTalk users can print to LocalTalk printers such as Apple's LaserWriter Select 360.
- Macintoshes on EtherTalk can access other shared LocalTalk devices, such as modems and file servers.
- LocalTalk based Macs can access EtherTalk based file sharing and printing services.
- Extend the useful life of LocalTalk devices in an EtherTalk environment.
- Smallest, lightest LocalTalk to Ethernet bridge available.
- Plug and Play installation.
- Lifetime Warranty and 24-hour replacement.

Product Features

MicroPrint: Supports 1 LocalTalk device.

Technical Specifications

Dimensions:
Length: 4.6" (11.6cm)
Width: 2.9" (7.5cm)
Height: .9" (2.4cm)
Weight: 4.7oz (.6kg)

..TIL18313-MicroPrint-Ethertalk_Adaptor_for_LaserWriter_360_Specs_8-95.pdf

Power: External 5V DC, 1A power adapter, 90-120V AC, 60 Hz

Connectors: 10Base-T, Thin Coax Ethernet, DIN-8 LocalTalk Minimum System, Mac Plus, System 6.0.5 or greater

Ordering Information

Part# T1556LL/A microPrint by Sonic Systems (EtherTalk adapter)
Available on the Apple Price lists.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Pointer Mode Control Panel: ReadMe File (11/95)

Article Created: 04 August 1995
Article Reviewed/Updated: 22 November 1995

TOPIC -----

This article contains the Read Me file for the Pointer Mode control panel that ships with System 7.5.2 on Power Macintosh 7200 computers.

DISCUSSION -----

Including the Pointer in Screen Captures

If you take a screen shot and the pointer does not appear in the captured graphic, you can use the Pointer Mode control panel to ensure that the screen-capture program includes the pointer.

To install the Pointer Mode control panel, follow these steps:

1. Drag the Pointer Mode control panel icon to the System Folder icon on your hard disk (do not open the System Folder).
2. When a message appears asking if you want the control panel placed in the Control Panels folder, click OK. Your computer recognizes that this is a control panel and automatically places it in the Control Panels folder.

To use the Pointer Mode control panel:

1. Open the Apple menu and choose Control Panels.
2. Double-click the Pointer Mode control panel to open it.
3. Click the checkbox to set the pointer to standard mode.

If you find that the pointer flashes a lot when you place it over graphics, you may want to use the Pointer Mode control panel to turn off standard mode.

Tips

====

Reconnecting to a Server

If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu once power is restored, you get a message that the disk could not be opened because you do not have enough access privileges. Before you can reconnect to the server, you must close any open files. If you need to save work in a file, use Save As to save it on a different disk.

Software for the GeoPort Telecom Adapter

For Power Macintosh computers, the software necessary to use the GeoPort Telecom Adapter is Apple Telecom software version 2.1 or later. Apple Telecom 2.1 is included in the Apple Telecom folder within the Apple Extras folder, and on the Power Macintosh CD.

The Apple Telecom folder also contains MegaPhone 1.0.2, a screen-based telephone application that supports the telephone capabilities of the Apple Telecom 2.1 software, including dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information.

If you previously purchased the Apple Telecom 2.0 upgrade package or a Geoport Telecom Adapter Kit that included Apple Telecom 2.0, you also received SITcomm SE/GTA (a terminal emulation program). SITcomm is compatible with the Power Macintosh 7500 and 8500 series computers.

If you are using a GeoPort Telecom Adapter with Apple Telecom 2.1 software, be sure to disable LocalTalk. To do this, disconnect any devices attached to the printer port (except serial printers, which can remain attached).

Apple Telecom 2.2 is available as part of the GeoPort Telecom Adapter Kit, which can be purchased separately. The kit includes MegaPhone as well as SITcomm SE/GTA. Apple Telecom 2.2 along with MegaPhone (but without SITcomm) will also be available as a free upgrade on CompuServe, America Online, and all Apple Internet sites.

Using an AudioVision 14 Monitor

It is recommended that you use the buttons on the front of the monitor, instead of the AudioVision control panel, to adjust sound and picture. See the AudioVision 14 Display user's guide for instructions on using the buttons.

About Video Capture

For best video capture performance, you need at least 16 megabytes (MB) of random-access memory (RAM) installed in your computer.

You can increase the speed of video capture by taking one or more of the following actions:

- Turn off virtual memory (VM).
- Set the screen bit depth to millions of colors.
- Reduce the size of the capture window (320x240 and smaller are the best sizes).
- Make sure that your capture program has enough extra memory allocated for one second of video at the size and bit depth that you are using to record. For example, to record 30fps at 320x240 in millions of colors requires at least 4500K (4.5 MB) free in the application partition. About This Macintosh (located under the Apple Menu) will allow you to estimate memory usage.
- Do not allocate all of the available memory to the capture application. When your capture program is running, you should have an unused block size of at least 500K in About This Macintosh.
- Do not run programs other than the capture application while capturing video. If feasible, turn off AppleTalk, the menu bar clock, and all extensions except for QuickTime. (Use the Extensions Manager control panel and restart.)
- Make sure that your hard drive has enough free space to record and is not fragmented. If you notice a performance degradation, running a disk optimizer may help.

When working with applications that support adjusting video and sound settings, the following settings will allow the highest video capture performance:

- Use the Component Video video compressor. Do not use post-compression.
- Set sound input sampling to 16 bits, stereo, and 44.1 KHz. Do not use a sound compressor.

Troubleshooting

=====

Energy Saver Control Panel

Do not remove the Energy Saver extension from the Extensions folder. If you remove it, you cannot turn off any energy-saving features the control panel is currently set to provide, such as automatic sleep or shutdown.

AppleShare Displays Incorrect Information for Large Drives

If you use File Sharing to connect to a disk attached to another computer, and the shared disk is larger than 2 gigabytes (GB), the Get Info box for that disk shows an incorrect size. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

AppleShare Server Software version 4.1

If you purchase AppleShare server software version 4.1, make sure to choose Custom Install (instead of Easy Install) when you install it.

... Note: The following is not included in the original ReadMe file:
We do not recommend using version 4.1 or earlier of AppleShare Server Software on the Power Macintosh 7500 & 8500. Version 4.1 is intended only for Apple Workgroup Servers, and earlier versions will not work. At the time of this writing Apple does not recommend using a PCI based Macintosh as an AppleShare Server....

Printing With Apple PhotoFlash

If you have problems printing images with the PhotoFlash software, make sure that you choose a printer in the Chooser before you choose the Print command from the File menu.

PowerTalk and PowerTalk Direct Dialup Mail

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Using a RAM disk

If your computer has 8 megabytes of RAM (random access memory), and you wish to set up a RAM disk, allocate no more than 544K to the RAM disk. Otherwise, when you start your Macintosh you may see the message, "This disk is unreadable by this Macintosh. Do you want to initialize the disk?" (Important: This message applies to the RAM disk, not to your hard disk, which will not be initialized.)

Using Virtual Memory

A maximum of 1,000 megabytes of disk space can be used as virtual memory. If your hard disk has additional disk space available, the amount over 1,000 megabytes cannot be used as virtual memory.

The Assistant Toolbox and Non-Networked Printers

The Print Later option (LaserLaser) of the Assistant Toolbox extension is not compatible with some non-networked PostScript printers. If you have the Assistant Toolbox extension installed on your computer and you want to print with a non-networked printer, you may want to turn off the Assistant Toolbox extension.

For example, if you want to print with a LaserWriter Select 310 printer, you need to turn off the Assistant Toolbox extension (in the Extensions Manager control panel) to be able to use the Print Later option.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your Power Macintosh, make sure you use version 1.2 or later. In the United States, you can obtain an upgrade by calling the Apple Order Center.

To use the Chinese Language Kit with your Power Macintosh, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, first install the WorldScript Updater 1.0. Then install the Chinese Language Kit version 1.1. Finally, install the Chinese Language Kit Updater to update your software to version 1.1.1.

Apple Personal Diagnostics

To use Apple Personal Diagnostics (APD) on this Power Macintosh computer, you should upgrade to APD v1.1.3 or greater. An upgrade patch for owners of APD v1.1 and APD v1.1.1 is available on online services and AppleLink.

If you run the Logic Board tests in APD v1.1, your computer may freeze and need to be restarted; or APD v1.1 may falsely report a logic board error when none has actually occurred. APD v1.1.1 and v1.1.3 correct these Logic Board test errors. APD v1.1.3 also corrects a reporting error regarding processor speed in the System Info/Basic Info screen.

...Note: This note is not in the original Read Me file.

Apple Personal Diagnostics 1.1.3 is not supported on the Power Macintosh 7500 or 8500 computers. As of the modification date of this article, the Power Macintosh 9500 is the latest released computer supported by Apple Personal Diagnostics. Apple has no plans to support the Power Macintosh 7500 or 8500 in future releases of APD....

QuarkXPress

To use QuarkXPress with System 7.5.2 on a Power Macintosh, you must upgrade to QuarkXPress version 3.3.1 or later.

Incorrect Balloons for Guide File Icons

System 7.5.2 includes Apple Guide documents, which provide the on-screen instructions and other information that help you use your computer. However, if you turn on Balloon Help —by choosing Show Balloons from the Guide (question mark) menu—and point to a Guide file icon (any icon with the Guide question mark on it) on the hard disk, the balloon may give you the wrong information about where the file belongs or what you can do with it. To avoid being misled by incorrect balloons, follow the guidelines below:

- Leave Guide files where they are. Some Guide files (for example, the Guide file named "Macintosh Guide") belong in the Extensions folder. Other Guide files do not belong in the Extensions folder—and will not work if they are put there.
- Keep application programs that have Guide files in the same folder as the Guide file. For example, keep the file named "File Assistant Guide" in the same folder as the File Assistant program. If you move a Guide file that belongs with an application program, you won't be able to get help while using the program.

Screen Flashes at Startup

You may see the screen flash during startup of your Power Macintosh. The flash is normal. It occurs because software needed to use the monitor is being loaded.

StyleWriter and StyleWriter II Printers

If you use a StyleWriter or StyleWriter II printer with your Power Macintosh, use the StyleWriter 1200 printer software (called a "printer driver"). Do not install your older StyleWriter driver; it is not compatible with Power Macintosh computers. For more information about choosing a printer and printing, choose Macintosh Guide from the Guide (question mark) menu, and choose the Printing & Fonts topic area.

Presenting QuickTime Movies at Double Size

Using MoviePlayer 2.0, you can play a movie at double (2X) size. You cannot present a movie (that is, play the movie on a second monitor) at double size. Presenting a movie at 2X size results in the MoviePlayer application quitting without warning.

Important Information About Virtual Memory

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory may help you avoid running out of memory.

Your computer comes with virtual memory turned on. With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems (such as your computer's responses seeming unusually slow) using certain application programs, you may want to turn off virtual memory. For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. Then click "How do I use hard disk space as memory?" and "How do I manage Power Macintosh memory?"

For best performance, try setting virtual memory to no more than 150% of the memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive).

To improve performance, you can also add memory (RAM) to your computer. See the user's manual that came with your computer for more information.

Important Information About Document Auto-Save

The Energy Saver control panel that comes installed on the Power Macintosh 7200 contains a feature named "Document Auto-Save". The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When an application is incompatible with

Document Auto-Save, it will either not automatically quit, or it displays alerts or dialog boxes which Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave no documents open that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel to sleep instead of shutting down when unsaved documents are open.

For more information about Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide (question mark) menu, and choose the Power & Energy Saving topic area. Below are some additional helpful tips.

Reopening Auto-Saved Documents

Document Auto-Save will automatically reopen a maximum of 10 documents per application when starting up after a scheduled or idle shutdown. If more than 10 documents were saved for any application during the idle or scheduled shutdown, the additional documents must be reopened manually.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Applications That Auto-Save

Document Auto-Save performs more quickly and efficiently if you have enabled auto-saving in the applications that support it. For example, Microsoft Word has an option available that will save your changes at pre-determined time intervals. It is recommended that you take advantage of application auto-saving whenever possible.

RAM Disks

Do not choose a folder on a RAM disk for auto-saving untitled documents unless you have installed a product which preserves the RAM disk contents before shutdown. Otherwise, your auto-saved documents will be lost when an idle or scheduled shutdown occurs.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Stickies Windows

If you are using the Document Auto-Save feature of the Energy Saver control panel, and you have any Stickies notes open during an idle or scheduled shutdown, an extra carriage return is inserted in the active (frontmost) Stickies note window. No other Stickies windows will be affected.

Important Information About Macintosh PC Exchange

=====

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with Macintosh PC Exchange and should not be used while PC Exchange is installed. Version 2.0 of PC Exchange contains an easier method for accessing DOS and Apple II ProDOS disks on a Macintosh.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Macintosh, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the Macintosh-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both Macintosh- and DOS-format partitions, PC Exchange will recognize only the Macintosh partition. In addition, PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Macintosh-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Macintosh, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your Macintosh computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your Macintosh.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and

partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

- A "Sad Mac" icon may appear on your Macintosh screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your Macintosh.
- Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Important Information About Open Transport Networking

MacTCP

After you install new networking software on your hard disk, if you have problems with TCP/IP applications, look in the Control Panels folder for a MacTCP file. If one is there, remove it from the Control Panels folder and restart your computer. Each time you install new networking software, you may want to verify whether or not the software's installer also installed MacTCP, and follow this procedure.

Application Compatibility Comments

FTPD: Application currently is experiencing sporadic failures with TCP/IP MacTCP compatibility. These failures are rare and generally do not result in loss of data or other problems.

MacTCP Watcher, TCP/Connect II, MacTCP Switcher, and Anarchie are applications that are known to be incompatible with Open Transport. Developers are revising their products to be compatible with Open Transport.

Timbuktu works only with AppleTalk using Open Transport.

Eudora: Open Transport supports commercial version 2.11 and shareware version 1.5.1 of Eudora.

FileMaker Pro TCP/IP networking throughput is noticeably slower than with classic MacTCP.

NFS/Share for large file transfers must have a blocksize of 16K or smaller.

TCP/IP LAP (Link Access Protocol) Support Caveats

Only the following MacTCP Link Access Modules are supported: "InterSLIP", "InterPPP", "InterPPP II", "TCP/IP PPP", "MacSLIP", and "MacPPP".

Open Transport does not support SLIP and/or PPP connections occurring automatically when the networking application is executed with the currently available MacTCP Link Access Modules (e.g. MacPPP, InterSLIP, InterPPP, MacSlip). SLIP/PPP connections must be started up using the 3rd-party-supplied control panel before running the TCP/IP application.

InterSLIP: Version 1.0.1 is not compatible with Open Transport, you need a later version. InterCon should be contacted directly.

InterPPP 1.2.9: May crash when receiving a large graphic file via HTML readers.

MacSLIP 2.0.6: Connect at System Startup doesn't work.

MacPPP: MacPPP versions 2.0.1, 2.0.1 cm4, and 2.1 SD exhibit incompatibilities with Open Transport in opening connections. Future versions (e.g. MacPPP 2.2.0) will address this incompatibility. The MacPPP "Open" button does not work; the only way to open a connection is by opening a TCP/IP application. However, Open Transport might time-out before the completion of the connection so that it cannot get the correct IP address from the LAP. After disconnecting MacPPP, you must restart your Macintosh in order to connect again.

Once a TCP/IP application is opened over a SLIP or PPP LAP, you cannot use another SLIP or PPP LAP without restarting the Macintosh.

When a SLIP or PPP LAP is selected in the TCP/IP control panel, and "Manually" is selected in the Configure pop-up menu, the value of the IP address entered in this control panel is ignored by Open Transport. If you are assigned a static IP address by your SLIP or PPP provider, you should set it in the LAP configuration program. If your IP address is assigned dynamically, you should configure the LAP configuration program for dynamic addressing.

PowerShare Mail Server

There is a known compatibility problem between Open Transport and version 1.0 of the PowerShare Mail Server. If you set up the PowerTalk Universal Mailbox to read mail on the same machine on which the PowerShare Mail Server is running, the Mail Server may crash some time later, usually on shutdown. The workaround is to use another machine to read mail. This problem will be fixed in PowerShare Collaboration Servers version 1.1.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the software update mentioned here:

LaserWriter 16/600 PS: Legal Size & QuickDraw GX 1.1.3 (5/96)

Revised: 6/4/96
Security: Everyone

LaserWriter 16/600 PS: Legal Size & QuickDraw GX 1.1.3 (5/96)

Article Created: 07 August 1995
Article Reviewed/Updated: 31 May 1996

TOPIC -----

When trying to print legal size documents from the manual feed or multi-purpose tray on a LaserWriter 16/600 PS using QuickDraw GX 1.1.3, the document is getting cut off at 11 inches (letter size); where part of the top and three inches from the bottom are not printed. To some, it may appear that the image is moved up the page.

DISCUSSION -----

This problem has been duplicated and reported to engineering. Setting the Multi-purpose tray for Legal-sized pages using the Apple Printer Utility will resolve this issue, however, LaserWriter GX doesn't realize that the tray has been set for Legal. When printing, this results in a dialog stating that it can't find a Legal-sized tray. Selecting "Manually feed all US Legal pages" will print the page correctly.

To set the Multi-purpose tray for Legal, launch the Apple Printer Utility, open a printer, select "Job Defaults," then "Paper Handling." Select "Legal" from the pop down menu for "Default paper size for Multipurpose Tray."

Setting the Multi-purpose tray for Legal-sized paper does not affect printing Letter-sized documents from the same tray.

This problem does not occur using the standard LaserWriter 8.x driver.

Article Change History:

31 May 1996 - Updated for QuickDraw GX 1.1.3
08 Aug 1995 - Removed misleading information.

AppleVision 1710AV Display: Power Light Not Visible (8/95)

Revised: 8/17/95
Security: Everyone

AppleVision 1710AV Display: Power Light Not Visible (8/95)

=====

Article Created: 7 August 1995
Article Reviewed/Updated: 17 August 1995

TOPIC -----

My AppleVision 1710AV display has an image on the screen, but the power light does not appear to be on. If I am sitting directly in front of the AppleVision 1710 AV monitor, I can see the power light. If I move my head more than 30 degrees in any direction, I cannot tell if the light is on.

DISCUSSION -----

This is a common problem with some plastic lenses that cover LED power indicators. Some lenses refract light better than others, resulting in a greater angle of view from the side. On the AppleVision 1710 AV display, the plastic lens has an angle of view of about 60 degrees.

Article Change History:
17 Aug 1995 - Made minor grammatical changes.

Laserwriter 12/600 PS: Cost Per Page (8/95)

Revised: 8/17/95
Security: Everyone

Laserwriter 12/600 PS: Cost Per Page (8/95)

Article Created: 7 August 1995
Article Reviewed/Updated: 17 August 1995

TOPIC -----

What is the cost per page on the 12/600 Color LaserWriter PS printer?

DISCUSSION -----

The exact cost per page depends on the percentage of black and color coverage desired by the customer.

Here are some sample page coverage amounts with the estimated street price for consumables factored in:

Begin_Table

Black and White	@ 5% coverage (Typical business letter) = \$.03
Black and White	@ 7.5% coverage (Informal letter) = \$.05
Color	@ 20% coverage (Typical proposal including a chart, a small graphic and text = \$.13
Color	@ 58% coverage (Complex Desktop Publishing page) = \$.35
Color	@ 77% coverage (Presentation page with a large photo or background, graphic and text = \$.46

End_Table

Costs may vary. The color blue is made from different percentages of cyan and magenta. If a file contains blue instead of cyan, the cost is higher as more magenta is applied. There is no 100% coverage information since 100% of all colors would produce a solid "muddy" brown/black page.

Article Change History:
17 Aug 1995 - Added table tags for formatting.

Megaphone for Performa: Cannot Dial Long Distance (1/97)

Revised: 1/31/97
Security: Everyone

Megaphone for Performa: Cannot Dial Long Distance (1/97)

=====

Article Created: 7 August 1995
Article Reviewed/Updated: 30 January 1997

TOPIC -----

When using MegaPhone to dial long distance on a Macintosh Performa 6200 series computer, there is a ring, then silence, then a short sound, then silence, and then a busy signal. Finally, an error dialog box appears. This happens repeatedly whenever we try to dial long distance.

DISCUSSION -----

The Macintosh Performa 6200 series computer comes with a Global Village Teleport Gold IIv 14.4 Kbps fax send/receive modem installed in the Communications slot. These computers are also bundled with the MegaPhone for Performa software, which lets the computer function as a speakerphone and digital answering machine.

Cypress Research released an update to the MegaPhone software which addressed some intermittent problems with MegaPhone and Global Village Gold IIv and Platinum IIv modems. MegaPhone v1.0.3P is available from Cypress Research's FTP site and from the Apple Software Updates on the online services.

You should also follow these steps to make sure your MegaPhone software is configured properly:

Step 1

Open the Telephone Setup control panel. In the General Setup area, there is an option for tone dialing. Make sure it is not checked if you are using a pulse phone line.

Step 2

If you were trying to make a call from your home, make sure that you do not have the option set to dial "9" or any other numbers before dialing a call. To check, open MegaPhone and select Preferences from the File menu. In the "General"

Topic, make sure that you have not selected the option to dial a "9" before calling. Make sure it is set to dial a "1" before making a long distance call.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Cypress Research's address and phone number.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

30 Jan 1997 - Renamed article to better reflect contents.
10 Apr 1996 - Added note about availability from Apple's site.

PowerShare Server and Workgroup Servers (7/95)

Revised: 8/7/95
Security: Everyone

PowerShare Server and Workgroup Servers (7/95)

Article Created: 27 July 1995

TOPIC -----

I get a fatal error when trying to install the PowerShare Server software (the whole disk set) on my Workgroup Server 6150, running System Software version 7.5 or later. How can I install this successfully?

DISCUSSION -----

The disk set you describe was issued in two sets: either as a pre-Power Macintosh 10-disk set or 11-disk set for installing onto a Power Macintosh. The error is occurring because the installer script on these disks is trying to install 7.1.2 resources over your active System 7.5 software.

Follow these steps to manually install the Powershare Server software on a Workgroup Server 6150, 8150, or 9150.

Step 1

Start up from the Workgroup Server CD and run the installer for PowerTalk. (To bypass the currently selected start-up device, start or restart the computer while holding down the Command-Option-Shift-Delete key.)

Step 2

Insert the PowerShare Server Install Disk 3 and install the PowerShare Catalog Server and the PowerShare Mail Server applications.

Step 3

Place aliases to the PowerShare Catalog Server and the PowerShare Mail Server applications in the Startup Items folder of the System folder.

Step 4

Restart your Macintosh computer to make the PowerShare Server software active.

Step 5

Setup the server as per the instructions in the "PowerShare Collaboration Servers System Manager's Guide."

NOTE:

The PowerShare Admin program is on the Powershare Server Install Disk 2.

SimpleSound: Creating Clickable Sound Files (5/96)

=====

Article Created: 7 August 1995
Article Reviewed/Updated: 20 May 1996

TOPIC -----

The SimpleSound application, which resides in the Apple Menu Items folder on Power Macintosh 7500, and 8500 (with System 7.5.2 update) systems, creates sound files that must be opened with SimpleSound in order to be played. Double-clicking on these sound files does not play back from the Finder, but launches SimpleSound instead. These sound files cannot be dropped on the System Folder and used as an alert sound.

DISCUSSION -----

On the Power Macintosh 7500, and 8500 computers, the Sound & Displays control panel replaces the current Monitors, Sounds, and AV Setup control panels, providing a simplified interface that makes all of the video, monitor, and sound input and output much more accessible and usable. It does not provide the utility to add sounds to the System file. Sounds can be recorded to the System file using the SimpleSound application.

Sound Types
=====

SimpleSound can create two types of sounds.

SimpleSound Documents

The first type of sound files that can be created are those that are identified by the Finder as SimpleSound documents. These are recorded directly to disk as standard AIFF files. The AIFF files can be opened and used by QuickTime-compatible applications, such as MoviePlayer and Avid VideoShop, as well as standard Macintosh sound editing applications (such as SoundEdit 16).

To create an AIFF sound file, open the SimpleSound application and click on

SimpleSound in the Apple Menu Items. The Alert Sounds window appears.

Select New from the File menu and record a sound as before. The standard File dialog box appears and lets you save the sound to disk.

System Sounds

The second is "System" sounds -- standard Macintosh sound files that can be played by opening them in the Finder. SimpleSound can save these directly into the System file of the current System Folder. SimpleSound cannot save these directly as "System" sound files to the Finder.

Steps for Creating Clickable "System" Sound Files

This addresses an issue on how to create clickable "System" sound files. To use SimpleSound to create System sounds, do the following:

Step 1

To open the SimpleSound application, choose SimpleSound in the Apple Menu Items. The Alert Sounds window appears.

Step 2

Click the Add... button.

Step 3

Record a sound and click the Save button.

Step 4

Quit all open applications.

Step 5

Open the System file of the current System Folder.

Step 6

Drag the newly recorded sound to another area.

You now have a clickable "System" sound file. These files can be dropped back on to the System Folder to be used as an alert sound.

Plaintalk 1.4: About Plaintalk 1.4 ReadMe file(8/95)

Revised: 8/8/95
Security: Everyone

Plaintalk 1.4: About Plaintalk 1.4 ReadMe file(8/95)

=====

Article Created: 07 August 1995

TOPIC -----

This article contains the Read Me file for the Plaintalk 1.4 Customer Speech Recognition software package.

DISCUSSION -----

About PlainTalk 1.4

PlainTalk is a collection of software that enables your Macintosh to speak written text and respond to spoken commands. PlainTalk 1.4 includes three components, each with its own installer: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition.

This document describes each of these three software packages, and discusses the differences between PlainTalk 1.3 and PlainTalk 1.4.

English Text-to-Speech

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. To install the English Text-to-Speech software, you need the following software and hardware:

- any Macintosh or Power Macintosh computer
- version 6.0.7 or later of system software
- at least 300 kilobytes (K) of RAM in addition to what the rest of your system software requires
- at least 5 megabytes (MB) of space available on your hard disk

For more information about the English Text-to-Speech software, see the Using English Text-to-Speech document or the About English Text-to-Speech document in the English Text-to-Speech folder.

Mexican Spanish Text-to-Speech

With the Mexican Spanish text-to-speech software installed, many Macintosh programs can read Spanish text out loud. To install the Mexican Spanish text-to-speech software, you need the following hardware and software:

- a Power Macintosh computer or a Macintosh computer with a 68020, 68030, or 68040 processor
- version 7.0 or later of system software
- at least 1.3 MB of RAM in addition to what the rest of your system software requires
- at least 2 MB of space available on your hard disk

For more information about the Mexican Spanish Text-to-Speech software, see the Using Mexican Spanish TTS document in the Mexican Spanish Text-to-Speech folder.

English Speech Recognition

With the English Speech Recognition package and the proper hardware, your computer can respond to spoken commands. The English Speech Recognition package includes the Speech Recognition system extension, the Speech control panel, and a utility called Speakable Items. With Speakable Items, whenever you say the name of an item inside the Speakable Items folder (which is inside the Apple Menu Items folder), the computer acts as if you double-clicked the item.

You can turn Speakable Items on and off using the Speech control panel. You can also use the Speech control panel to set several preferences for how Macintosh Speech Recognition programs listen and respond. For example, you can set the Listening options in the Speech control panel so that the recognizer only listens while you hold down a key of your choice. When you use this option recognition accuracy is improved and misfires (when the computer thinks you spoke a command but you didn't) are eliminated.

To install and use the English Speech Recognition software, including the Speakable Items software, you need the following hardware and software:

- a Power Macintosh computer
- system software version 7.5 or later
- a 16-bit microphone, such as the Apple PlainTalk Microphone or the microphone built into some Apple audiovisual displays (Note: this version of PlainTalk does not work very well with the microphone built into some AudioVision 14 displays.)

For more information about the English Speech Recognition software and the Speakable Items utility, see the Using Speech Recognition document in the English Speech Recognition folder.

Differences between PlainTalk 1.4 and PlainTalk 1.3

Earlier versions of the PlainTalk software had a single installer program that installed both text-to-speech and speech recognition. This version (1.4) contains three different installers to make it easier to install just the parts that are appropriate for your needs: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition. It doesn't matter what order you install them in, and you don't have to install them all. However, if you install version 1.4 of English Speech Recognition or Mexican Spanish Text-to-Speech then you should also install version 1.4 of English Text-to-Speech instead of using an older version of English Text-to-Speech.

Deciding whether to upgrade to version 1.4

In general, version 1.4 offers a more robust and flexible set of features than earlier versions. However, some people in special circumstances may do better with version 1.3.

- If you have a Macintosh AV computer that has a 68040 processor and you use PlainTalk 1.3's speech recognition capabilities, Apple recommends that you continue using version 1.3 of the PlainTalk software. Though the new text-to-speech software works with these computers, the new speech recognition software does not (because it runs on Power Macintosh computers only). It is not recommended that you mix versions, using the old recognition software with the new text-to-speech software. (Note: all the new software works with Power Macintosh AV computers.)

- If you have an Apple AudioVision 14 display, Apple recommends that you keep using version 1.3, unless you have an Apple PlainTalk microphone. Version 1.4 of the speech recognition software does not work well with the microphone built into some AudioVision 14 displays.

- If you make extensive use of PlainTalk 1.3's Speech Macros, the Speech Macro Editor, or the ability to speak menu commands, then you might want to continue using version 1.3. As part of the effort to make the software more robust, version 1.4 of English Speech Recognition supports Apple's standard AppleScript ScriptEditor instead of the Speech Macro Editor, and it does not support the ability to speak menu items. This is discussed more below.

What's new in English Text-to-Speech

English text-to-speech software version 1.4 is very similar to earlier versions. The main differences are:

- English Text-to-Speech 1.4 has its own installer.
- English Text-to-Speech 1.4 includes a Speech control panel that lets you select a system-wide default voice and rate, which is used by many text-to-speech programs, including SimpleText and the Speakable Items utility.

What's new in Mexican Spanish Text-to-Speech

PlainTalk 1.4 is the first version of PlainTalk to include support for Mexican Spanish text-to-speech.

What's new in English Speech Recognition

English Speech Recognition version 1.4 has some significant differences from the speech recognition software in earlier versions of PlainTalk. Some features have been eliminated to simplify speech recognition and make it more robust and usable. Other options have been added to increase accuracy and eliminate misfires.

- Version 1.4 offers a new listening option in the Speech control panel, "Listen only while key(s) are pressed," that lets you leave Speakable Items on all the time without worrying about misfires. It also improves the accuracy of recognition.
- Version 1.4 works in a wider range of environments thanks to its greatly improved adaption to room acoustics.
- Version 1.4 does not include or support Speech Macros, the Speech Macro Editor, or Speech Rules. It still supports speaking dialog buttons and the Speakable Items folder. Any item you place inside the folder becomes speakable—saying the name of the item launches or opens the item. You can use the AppleScript ScriptEditor to create scripts that are launched by speaking a command: just save the scripts inside the Speakable Items folder. To see examples, look inside the Speakable Items folder.
- Version 1.4 runs on Power Macintosh computers only, and does not support Macintosh AV computers with 68040 processors. You can continue to use PlainTalk 1.3 on 68040 Macintosh AV computers.
- Version 1.4 does not include automatic support for recognizing the spoken names of menu commands. You can still manipulate scriptable programs, such as the Finder, using AppleScript commands. To see examples, look inside the Speakable Items folder.

Known bugs and workarounds in PlainTalk 1.4

This section describes a few bugs found at the last minute in PlainTalk 1.4, along with workarounds where possible. More troubleshooting information can be found in the documents in the three installer folders.

Apple AudioVision 14 displays. Version 1.4 of English Speech Recognition does not work well with the microphones built into some Apple AudioVision 14 displays. If you have problems using speech recognition with the microphone built into this display, you can use the Apple PlainTalk Microphone (part # M9060Z/A) or you can go back to using PlainTalk 1.3. To go back to version 1.3, use the 1.4 installers to deinstall the new version, then use your old 1.3 installers to reinstall version 1.3.

Mixing Text-to-Speech 1.4 with Speech Recognition 1.3. Apple does not recommend using version 1.4 of text-to-speech with version 1.3 of speech recognition. The PlainTalk 1.4 speech recognition options are visible in the Speech control panel but do not work with the PlainTalk 1.3 speech recognition software. If you do mix them, remember to use the correct control panel for your task: to configure

speech recognition version 1.3, use the Speech Setup control panel; to configure text-to-speech version 1.4, use the Voice option of the Speech control panel. You should ignore all the other options of the Speech control panel.

Wrong name in the Using English Speech Recognition document file. In the Using English Speech Recognition document, the phrase "Speakable Items control panel" is sometimes used where what is meant is "Speech control panel."

Popup menus in HyperCard 2.3. On some Power Macintosh computers, version 1.4 of the Speech control panel interferes with popup menus in HyperCard 2.3. If you experience this problem, you can move the Speech control panel out of the Control Panels folder (and out of the System Folder), restart your computer, and still use text-to-speech and speech recognition. If the Speech control panel is not in the Control Panels folder then Speakable Items will not turn on automatically when your computer restarts (but you can still use the Speech control panel to turn it on), and the Speech control panel's default voice and rate options will be ignored.

At Ease 3.0: Rebuild Desktop After ClarisWorks 4.0 Install 8/95

Revised: 8/8/95
Security: Everyone

At Ease 3.0: Rebuild Desktop After ClarisWorks 4.0 Install 8/95

=====

Article Created: 08 August 1995

TOPIC -----

I have recently installed ClarisWorks 4.0 on my Macintosh computer running System 7.5.1. When I try to launch a ClarisWorks document, I get a message stating that the application cannot be found.

DISCUSSION -----

There have been reports of messages like this one and "Unable to locate appropriate translator" from users after installing ClarisWorks 4.0. This problem can be remedied by rebuilding the desktop file.

Apple recommends rebuilding the desktop file after any new software installation.

Apple Telecom 2.1: SITcomm ReadMe File (8/95)

Revised: 8/8/95
Security: Everyone

Apple Telecom 2.1: SITcomm ReadMe File (8/95)

Article Created: 07 August 1995

TOPIC -----

This article contains the combined SITcomm and SITcomm SE Read Me files. SITcomm ships with the AppleTelecom 2.1 software package.

DISCUSSION -----

SITcomm Read Me
Copyright 1993-1994, Aladdin Systems, Inc.
=====

"Read Us First!" Folder

Now that the software is installed, you might want to refer to your User's Guide Addendum in the "Read Us First!" folder on your hard disk. This file contains additional information which will aid your understanding of the product as well as explaining any new features and enhancements that have occurred since the printing of the User's Guide.

Register Your Software

If you have not already done so, please complete and mail your postage-paid Registration Card. Registered users are entitled to free technical support, upgrade notices, and special offers on Aladdin products. The registration number for personalizing the application can be found inside of the "Quick Start" card located in your package. After personalizing, be sure to write the registration number someplace where you can reference it later.

The User's Guide

Even though the software is easy to use, the comprehensive User's Guide covers every feature of the software. An addendum to the User's Guide can be found in the "Read Us First!" folder.

The Quick Reference Card

See the Quick Reference Guide for a brief description and overview of the software. Please keep the Quick Start card in a safe and easily accessible place. Your SITcomm registration number is on the back of this card and must be provided when you contact Aladdin Systems for assistance.

Thanks

We at Aladdin Systems would like to thank you for purchasing our product and for your continued support.

The rest of this document...

Listed below are sections on known issues, potential conflicts and workarounds for SITcomm.

=====

Known Issues

Apple Express Modem Tool - Limitations

Users of the Apple Express Modem Tool should be aware of the following limitations:

- 1) The Express Modem Tool does not support auto-redialing.
- 2) The Express Modem Tool does not support listening for a connection (listen mode).
- 3) The Express Modem Tool does not support canceling of a dialing operation once it has begun.

If you need any of these features, it is suggested that you use the Apple Modem Tool instead, which does support them.

Apple Express Modem Tool - Display Modem Monitor Window

When this option is enabled, the tool will improperly create the Modem Monitor window between the SITcomm toolbar and the current connection window. After the window is created, nothing will be drawn in the window until after the modem connection is established.

Keypad and Cursor Windows in the Frontier Runtime Scripting Menus

Occasionally, the VT102 keypad and cursor control windows will erroneously appear in the Runtime scripting menus. If you quit Runtime, and then relaunch it, the problem should correct itself.

Apple Modem Tool - 14400 baud rate speeds

Owners of 14.4 KB modems should not be alarmed that there is not a 14400 baud rate setting in the Apple Modem Tool. Just set the the Apple Modem Tool to the 38400 setting. This will automatically optimize the speed your 14.4 KB modem can send and receive data by automatically turning on high speed transfer

protocols.

=====

Possible Conflicts & Workarounds

Userland's Frontier & Frontier Runtime

Users of Frontier and Frontier Runtime should increase the application memory size of SITcomm by 100K.

Apple VT320 Terminal Tool

Users of the Apple VT320 Terminal Tool should increase the memory application size of SITcomm by 100K.

Pacer320 Terminal Tool

Users of the Pacer320 Terminal Tool should increase the memory application size of SITcomm by 100K.

Third-Party Extensions Managers & Possible Bus Errors (8/95)

Revised: 8/8/95
Security: Everyone

Third-Party Extensions Managers & Possible Bus Errors (8/95)

Article Created: 8 August 1995

TOPIC -----

After disabling most of my extensions and control panels with a third-party extensions manager, I get the following error:

"Sorry, a system error occurred. Bus error. To temporarily turn off extensions, restart and hold down the shift key."

If I restart with the shift key down, the system starts up without an error. What is the problem?

DISCUSSION -----

Your problem may be due to certain extensions not loading. When EtherTalk is selected in the network control panel, you may see this error on a Power Macintosh 8100/80 if the EtherTalk Phase 2 extension fails to load after the Apple Built-In Ethernet extension. Other Macintosh models may also exhibit this behavior. Both of these extensions are installed by the Network Software Installer (NSI) 1.5 or later.

Several third-party extension managers recognize the EtherTalk Phase 2 extension, but not the Apple Built-In Ethernet extension. So it may be possible to disable EtherTalk Phase 2 and not Apple Built-In Ethernet, resulting in the above error message. This situation does not occur when using the Extensions Manager, which comes with System 7.5.x, since the Extensions Manager does not present either extension as a choice to be deselected.

This problem can also arise when using a third-party extensions manager to execute the recommended procedure for rebuilding the desktop file with Macintosh Easy Open (MEO) installed. Normally you would disable all extensions and control panels except MEO before rebuilding the desktop file. When using a third-party extensions manager, you should disable all extensions and control panels except EtherTalk Phase 2 and MEO.

Express Modem ReadMe: Apple Telecom 2.1 Software (8/95)

Revised: 8/8/95
Security: Everyone

Express Modem ReadMe: Apple Telecom 2.1 Software (8/95)

=====

Article Created: 8 August 1995

TOPIC -----

This article is the Express Modem Read Me file which accompanies the Apple Telecom 2.1 software.

DISCUSSION -----

This software runs on the following machines with their respective Express Modem internal modems:

- PowerBook 160, 165, 165c, 180, 180c, using an internal Apple PowerBook 14.4 Modem Card.
- PowerBook Duo 210, 230, 250, 270c, 280, 280c, using an internal Apple PowerBook Duo 14.4 Modem.
- PowerBook 520, 520c, 540, 540c, using an internal Apple PowerBook Express Modem II Card.
- LC 575, Macintosh Quadra, LC, Performa 630, using an internal Macintosh Express Fax/Modem (for the United States and Japan only).

Installing over an older version of the software

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

NOTE: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

Preferred CCL scripts for Apple Remote Access

ARA 1.0: Express Modem ARA 1.x (in Extensions folder in System Folder)

ARA 2.0: Express Modem ARA 2.x (in Extensions folder in System Folder)

NOTE: These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide.

Two additional, optional connection (CCL) files, named Express Modem ARA 1.x/CNG and Express Modem ARA 2.x/CNG, are installed as well. When you use them, the Express Modem transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another Express Modem), you should select it in the Apple Remote Access Setup control panel.

NOTE: The Express Modem ARA 1.x/CNG and Express Modem ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Fax Sender GX with QuickDraw GX 1.1

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex grayscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

NOTE: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client

machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

NOTE: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

NOTE: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

SEE ALSO: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

Auto-answer setting

If Fax Terminal is set to Auto-answer, the Manual Receive is disabled.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript printers.

Troubleshooting

• Connecting to online services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the Express Modem to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

• Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from

the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

- Identifying incoming calls

When answering your phone line, the Express Modem will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application, we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

- Removing fax storage folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

- Resetting a blacklisting error message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

What goes where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- Express Modem Read Me
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (Manual for users who upgrade electronically)
- About Apple Fax Gateway (Manual for users who upgrade electronically)
- About Fax Sender GX (Manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- Modem AT Command Set
- Express Modem ARA 1.x/CNG (optional, transmits data calling tone)
- Express Modem ARA 2.x/CNG (optional, transmits data calling tone)

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- Apple Telecom Modem
- Express Modem ARA 1.x (Apple Remote Access 1.0 CCL)
- Express Modem ARA 2.x (Apple Remote Access 2.0 CCL)

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)
- Electronic Telephone (sound resource)

Sound In Options Not Available Message (9/95)

Revised: 9/15/95
Security: Everyone

"Sound In" Options Not Available Message (9/95)

=====

Article Created: 09 August 1995
Article Reviewed/Updated: 15 September 1995

TOPIC -----

I have a Power Macintosh running System 7.5 and can not play audio CD's. I can mount audio CD's, see the counter working in the AppleCD Audio Player, and hear audio from multimedia CD's and alert sounds without any problems. Pressing the "Options" button in the Sound In portion of the Sound control panel brings up the message "Sound input devices could not be accessed at this time." What is happening here?

DISCUSSION -----

This is an issue involving accessing sound options while running Speech Recognition. When you turn Speech Recognition on, it "listens" for commands captured by the microphone. Because of this, Speech Recognition will not allow you to select the Audio CD as the input source. Therefore, you cannot play an audio compact disc through your internal speakers while speech recognition is turned on.

Once Speech Recognition is turned off via the Speech Setup control panel, the sound in options of the sound control panel can again be accessed in the Sound In portion. Click the radio button under Audio CD and put an X in the playthrough option to hear your audio cd through your internal speakers.

AppleCD 600: Compatible with DOS Compatibility Card (8/96)

Revised: 8/19/96
Security: Everyone

AppleCD 600: Compatible with DOS Compatibility Card (8/96)

Article Created: 9 August 1995
Article Reviewed/Updated: 19 August 1996

TOPIC -----

Are the AppleCD 600i and 600e drives supported with the DOS Compatibility Card?

DISCUSSION -----

Yes, both the AppleCD 600i and 600e drives are supported using the DOS Compatible card. However you must use the Apple CD-ROM extension v5.1.1, PC Setup 1.0.7, and System 7.5.1. Both the CD-ROM Setup 5.1.1 and PC Setup 1.0.7 are available from online services. PC Setup 1.0.7 is only designed for the DOS Compatibility Card on Power Macintosh, and Macintosh 630 family computers. Apple does not recommend or support PC Setup 1.0.7 on Centris or Quadra 610 computers with a DOS Compatibility Card.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, Performa 640, LC 630, and Quadra 630.

There are some types of compact discs which are not supported in the MS-DOS/Windows environment, including Photo CD, and multisession compact discs. In addition to these types of discs, you cannot use multiple CD-ROM drives in the MS-DOS/Windows environment.

Audio CDs cannot be controlled from both the Windows and Macintosh environment at the same time.

The MS-DOS sets up a drive letter (E:) for a CD-ROM drive, even if there is not a drive attached. If you do not have a CD-ROM drive connected to your computer, you can gain additional memory by removing drive setup strings in the CONFIG.SYS and AUTOEXEC.BAT files.

What to Change

```
AUTOEXEC.BAT
REM  LH C:\DOS\MSCDEX /D:CDDVR /L:E

CONFIG.SYS
REM  DEVICE=C:\Apple\CDROM.SYS /D:CDDVR
```

The REM in front of the command makes MS-DOS ignore the line.

Transfer QuickTake Files From Macintosh to Windows (8/95)

Revised: 8/9/95
Security: Everyone

Transfer QuickTake Files From Macintosh to Windows (8/95)

=====

Article Created: 9 August 1995

TOPIC -----

I need to move some QuickTake files from my Macintosh to my PC. However, if I edit them on my Macintosh, I can no longer get the QuickTake files to open in Windows, why?

DISCUSSION -----

When you double click on a QuickTake file on a Macintosh, PhotoFlash opens the QuickTake file as the selected application. You can view the QuickTake file, but if you edit and save the file, and then want to move it to a Windows system, you will have to save the file in TIFF format. PhotoFlash can not save a document in QuickTake format.

For TIFF format files, save the file as a TIFF for Windows. Then add the suffix ".tif" to the file.

For QuickTake files, rename the file with a ".qtk" suffix.

More information is included in the manual on page 53.

NOTE: There is a summary of how to name the files in the QuickTake Read Me file, but not about using PhotoFlash. Also, you can view QuickTake format files, but not edit them. The advantage of using the QuickTake format, is the size of QuickTake files, which usually is 20% less than TIFF.

System Update 2.0.1: ReadMe File (8/95)

Revised: 8/9/95
Security: Everyone

System Update 2.0.1: ReadMe File (8/95)

Article Created: 09 August 1995

TOPIC -----

This article contains the Read Me file for the System 2.0.1 Update for use on System 7.1 and System 7 Pro.

DISCUSSION -----

WHAT IS SYSTEM UPDATE 2.0.1?

System Update 2.0.1 is a set of software enhancements that improves the performance of Macintosh computers running system software version 7.1 and System 7 Pro.

System Update 2.0.1 provides the enhancements of Hardware System Update 2.0 and Hardware System Update 1.0, plus the following additional enhancements:

- Includes Apple HD SC Setup version 7.2.2, which gives you more flexibility to format large Apple hard disks between 1 and 2 gigabytes.
- More efficiently manages the way fonts use memory.
- Includes AutoRemounter 1.2. This release significantly reduces network traffic compared to version 1.0.
- Includes Apple Disk First Aid 7.2, a utility that repairs damaged disks.
- Updates the Macintosh PowerBook Control Panel to version 7.1.3 and Express Modem software to version 1.1.2, which includes support for communications that do not use the Apple Communications Toolbox.
- Updates System Enabler 131 (version 1.0.3) for the PowerBook 160, 165, 165c, and 180 to support 12" monitors and improve reliability. (NOTE: There is a very small chance that your PowerBook may not boot when you turn it on for the first time after the update. If this happens, turn the computer off and back on, and

press Command-Option-P-R while the computer starts up.)

- Corrects color problems with the Apple Basic Color monitor on Macintosh Centris and Macintosh Quadra computers. (NOTE: If Hardware System Update 1.0 or Hardware System Update 2.0 extensions or the Basic Color Monitor extension are already installed on your computer, this update replaces them. The 2.0.1 update removes the Basic Color Monitor and the ADBReInit extensions and replaces them with a System Update 2.0.1 extension.)

For a review of the Hardware System Update 2.0 and Hardware System Update 1.0 enhancements, see "What Other Enhancements Does System Update 2.0.1 Provide?" at the end of this document.

KNOWN ISSUES

If you install System Update 2.0.1 on a Powerbook 100 with Express Modem software installed, your Powerbook 100 may not start up properly. If this happens, turn the computer off and back on, and hold down the Shift key while the computer starts up (to start up without using extensions). When the computer is ready, drag the Express Modem extension to the Trash. (NOTE: The Powerbook 100 is not designed to use the Express Modem.)

WHO SHOULD INSTALL SYSTEM UPDATE 2.0.1?

You should install this update only if you have Macintosh system software version 7.1 or System 7 Pro installed on your computer. (NOTE: This update is not intended for Macintosh Performa users.)

If you have already installed the earlier updates, you should still install System Update 2.0.1 in order to have the latest version of all system software. System Update 2.0.1 provides additional functionality and fixes problems that the earlier updates did not address.

HOW DO I INSTALL SYSTEM UPDATE 2.0.1?

To install the 2.0.1 update, do three tasks:

1. Install the System Update
2. Update your Apple utilities
3. Update your Apple drivers

See the step-by-step instructions below.

TASK 1—INSTALL THE SYSTEM UPDATE

The Easy Install process for System Update 2.0.1 automatically determines what

elements of the updated system software your computer needs, if any. There are also two optional enhancements which you can install (in step 6 below) after the Easy Install process is complete.

To install the software update, follow these steps:

1. If you currently have the Connectix Enabler Patch on your hard disk, remove it from your hard disk before proceeding with this installation.
2. Insert the System Update 2.0.1 disk in your floppy disk drive.
3. Double-click the Installer icon.
4. Read the Welcome screen, and then click OK.
5. Click the Install button.
6. When you see a message that installation is complete, do one of the following:

- a. If you want to install the Sound Manager Update, the 720K Floppy Disk Formatter Extension, or both, click the Continue button. (See "What Other Enhancements Does System Update 2.0.1 Provide?" at the end of this document for descriptions of these enhancements.) Then click Customize and select "Sound Manager Update," "720K Floppy Disk Formatter Extension," or both from the list on your screen. When you see a message that installation is complete, click the Restart button.

- b. If you do not want the additional enhancements, click the Restart button.

7. When you finish, continue with "Task 2—Update Your Apple Utilities" below.

TASK 2—UPDATE YOUR APPLE UTILITIES

The Utilities *f* folder on the System Update 2.0.1 disk contains Apple HD SC Setup version 7.2.2 and Apple Disk First Aid version 7.2. These updates are intended to permanently replace the copies of Apple HD SC Setup and Apple Disk First Aid on your System 7.1 or System 7 Pro Disk Tools disk. This update is recommended even if you have already installed Hardware System Update 2.0. Follow the steps below to update your utilities:

1. Insert the System Update 2.0.1 disk in your floppy disk drive.
2. Choose Eject Disk from the Special menu.
3. Insert the Disk Tools disk in your floppy disk drive.
4. Click the Utilities *f* window to make it active.
5. Drag the HD SC Setup and the Disk First Aid icons to the Disk Tools disk.

6. When your Macintosh warns you that the files on your Disk Tools disk have the same names as the items that you are moving, click OK.
7. Insert specific disks as requested until the files are fully copied.
8. When you finish, continue with "Task 3—Update Your Apple Drivers" below.

TASK 3—UPDATE YOUR APPLE DRIVERS

System Update 2.0.1 also contains a driver update for Apple hard disk drives. You should install the driver update even if you have already installed Hardware System Update 2.0. Follow the steps below to install the driver update on each Apple hard disk drive you own:

1. With your computer off, insert the Disk Tools disk in your floppy drive.
2. Turn on your computer.
3. Double-click the Disk Tools icon.
4. Double-click the Disk First Aid icon in the Disk Tools window. (NOTE: The Disk First Aid utility on your Disk Tools disk should be version 7.2 if you completed "Task 2—Update Your Apple Utilities" above.)
5. Click on the driver icon which corresponds to your Apple hard disk drive. If you have more than one Apple hard disk drive, hold down the shift key and click on all of the drivers.
6. Click the Repair button. Disk First Aid will now run its tests and make any necessary repairs on your drive. This may take a few minutes depending on the size of your drive.
7. Select Quit from the File menu.
8. Double-click the Apple HD SC Setup icon in the Disk Tools window. (NOTE: For more information on Apple HD SC Setup, see your Macintosh user's guide.)
9. Click the Drive button until the name of the hard drive you want to update appears.
10. Click the Update button.
11. Repeat steps 9 and 10 for any other Apple hard disk drives you own.
12. Click the Quit button.

WHAT OTHER ENHANCEMENTS DOES SYSTEM UPDATE 2.0.1 PROVIDE?

System Update 2.0.1 includes the enhancements from Hardware System Update 2.0 and Hardware System Update 1.0 (listed below). Some enhancements are Macintosh-model specific while others apply to a range of models. The first two enhancements described below are optional for any model of Macintosh computer. (See step 6 of "Task 1—Install the System Update" for instructions to install the optional enhancements.)

- Optional: Installs the 720K Floppy Disk Formatter Extension to allow you to format low-density floppy disks as 720K MFM disks.
- Optional: Installs the Sound Manager Update to improve sound performance on most Macintosh computers. (NOTE: When this software is installed, your system sound will revert to the Simple Beep. After installation, you may wish to reset the beep in the Sound control panel to your preferred sound.)
- Provides system-level improvements to increase overall system reliability on most Macintosh models.
- Improves the reliability of high-speed modems and similar devices connected to Macintosh LC, LC II, IIsi, IIVx, IIvi, Macintosh Classic II, Macintosh Quadra 900, and Macintosh Quadra 950 computers.
- Improves the accuracy of the system's clock in Macintosh LC, LC II, IIsi, IIVx, IIvi, Macintosh Classic II, Macintosh Quadra 900, and Macintosh Quadra 950 computers.
- Corrects problems ejecting floppy disks when the computer is shut down on Macintosh IIsi, IIci, IIVx, IIvi, Macintosh Quadra 700, and Macintosh Quadra 950 computers.
- Addresses possible floppy disk drive and hard disk problems with the Macintosh IIsi, IIci, IIVx, IIvi, Macintosh Centris, Macintosh Quadra, and Macintosh PowerBook and PowerBook Duo computers.
- Removes horizontal white lines that may appear while scrolling on Quadra and Centris systems with a Macintosh 16" Color Display.
- Adds software for the Apple Adjustable Keyboard, allowing you to connect the keyboard to any Macintosh computer without separately installing special keyboard software.
- Updates the Memory control panel to version 7.1.1, fixing possible memory problems using large RAM disks with System 7.1.
- Updates the Macintosh Color Classic System Enabler (System Enabler 401, version 1.0.5), which lets you add the Apple IIe Card and software to the Color Classic. In addition, the System Enabler improves mouse performance with the Color Classic. (NOTE: To use the Apple IIe Card with system software version 7.1 on a Color Classic, you need to have version 2.2.1 of the Apple IIe Card software. You can obtain an upgrade package for the Apple IIe Card software by contacting an Apple-authorized dealer, or by using the AppleLink path Apple Products: Apple SW Updates: Macintosh: Peripheral Software: Apple IIe Card for Macintosh LC.)

Apple strives to provide maximum reliability for its customers. This update provides specific improvements that many Apple Macintosh customers will find helpful.

Apple LAN Utility 1.0b3: ReadMe File (10/95)

Revised: 10/24/95
Security: Everyone

Apple LAN Utility 1.0b3: ReadMe File (10/95)

=====
Article Created: 09 August 1995
Article Reviewed/Updated: 24 October 1995

TOPIC -----

This article contains the Read Me file included with the Apple LAN Utility 1.0b3 software update package. This update adds support for the Power Macintosh 9500 computer.

This utility was replaced by Apple LAN Utility 1.0b4e1 in October 1995.

DISCUSSION -----

Apple LAN Utility version 1.0b3

The Apple LAN Utility is provided to perform the following tasks for Apple LAN interfaces:

- 1) Obtain the burned-in address without connecting to a network.
- 2) Override the burned-in address with a locally-administered address (this is mostly done in SNA and DECNet environments).
- 3) Set the speed for token ring interfaces that are software selectable.

The utility is intended to handle all Apple ethernet and token ring interfaces, whether built-in or on cards. When run, the utility opens one window per interface present in the machine, describing what its configuration will be the next time that interface is activated. This utility makes no attempt to alter the current operation of an active interface.

To make any changes to an interface, it is necessary to choose "Allow Changes" from the Edit menu. This was provided to minimize the chance of accidentally overriding a burned-in address.

To remove a locally-administered address, either clear the entry or set it to 12 zeroes.

..TIL18345-Apple_LAN_Utility_1-0b3-ReadMe_File_10-95.pdf

The utility can save a tab-delimited text file describing the machine's configuration. The file has the following format:

Line 1: The Macintosh model, machine name and user name
Line 2: Title strings
Lines 3 - n: One line per interface with bus/slot, interface name, burned-in address, local address and speed

The addresses are given in hexadecimal and are quoted to allow the file to be imported into a spreadsheet if desired.

Although the text file is rather ugly when viewed in TeachText/SimpleText, it can be made to look better when viewed in a word processor or spreadsheet program by adjusting the tabs or cell sizes appropriately.

This utility is provided free of charge on an "as is" basis. This is not an official product of Apple Computer!

Disclaimer of Warranty on Software. This software program and related documentation are provided "AS IS" and without warranty of any kind, and APPLE EXPRESSLY DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE. Macintosh LC 630 DOS Compatible: ReadMe File (8/95)

Revised: 8/9/95
Security: Everyone

Macintosh LC 630 DOS Compatible: ReadMe File (8/95)

=====

Article Created: 09 August 1995

TOPIC -----

This article contains the Read Me file for the Macintosh LC 630 DOS Compatible. This version of the Read Me file was included with the PC Setup 1.0.7 update software package.

DISCUSSION -----

Addendum to the Macintosh User's Guide
for the Macintosh LC 630 DOS Compatible

This document contains important information about using your Macintosh LC 630 DOS Compatible that is not included in your user's guide.

Contents

- Using the Floppy Drive
- Use of Floppy Disks as Drive Containers
- Startup Folder/Auto-start PC Conflict
- MIDI Transfers Supported on Macintosh Only
- Using the Two-Button Mouse
- Using a Flightstick Pro Joystick
- Bypassing the CONFIG.SYS and AUTOEXEC.BAT files
- Installing Corel Draw
- Using Norton Utilities
- Installing Microsoft Office, Word and Excel
- Amendments to Appendix E of the Macintosh User's Guide
- Using SAM 4.0
- SAM Intercept v4.0.2 Virus Checking
- Reinstalling DOS/Windows Software - WB.EXE File
- Printing
- Sound Control Panel Settings
- Using the Sound Blaster Card
- Using CD-ROM Drives
- Multimedia and Game Applications

- Rebuilding the Desktop
- Using PC Tools Pro 9.0
- Using MWUNDEL
- Using After Dark 3.0
- Using the Serial Port

Using the Floppy Drive

Both PC and Macintosh floppy disks are automatically mounted when inserted into the floppy drive, in either operating environment. This mounting process takes a few seconds. Macintosh users are familiar with this process; PC users will find that they should wait a few seconds before accessing the data on the floppy disk.

Certain DOS or Windows floppy disk utilities will not work with the DOS Compatibility Card. These utilities attempt to exercise direct control over the floppy drive, which they cannot do, since it is a Macintosh-controlled floppy drive. Instead, Macintosh disk utility applications should be used.

Use of Floppy Disks as Drive Containers

The LC630 DOS Compatible computer does not support the use of 3.5" floppy disks as drive containers. Floppy disks are intended for data use only.

Startup Folder/Auto-start PC Conflict

When two or more Macintosh applications are included in the Startup folder, be sure that the "Auto-start PC" is not selected in the PC Setup control panel. Under this circumstance you must switch to the PC mode manually and you must switch only after all Macintosh startup applications have finished launching.

MIDI Transfers Supported on Macintosh Only

The LC 630 DOS Compatible does not have the capability of sending and receiving MIDI data through the serial port for DOS and Windows. MIDI data does travel internally on the PC side, but when connected direct for use with a MIDI instrument, no data will transfer. MIDI transfers are fully supported on the Macintosh side.

Using the Two-Button Mouse

The standard Apple mouse has no right button and users must press the "extended =" key whenever they intend to use right button functions in one of their PC applications. However, users of a third party programmable mouse or trackball, such as Kensington Turbo Mouse 4.0 or Logitech MouseMan ADB, can use the utilities included with their mouse to map the "extended =" key to the right hand button.

The Kensington Turbo Mouse 4.0 includes two utilities to configure its buttons. They are: "Turbo Mouse Control 4.0.2" and "Turbo Mouse Basics 4.0.2". "Turbo Mouse Control 4.0.2", an application that requires an extension, does not effectively map the "extended =" key to the right button and should not be used. "Turbo Mouse Basics 4.0.2", a control panel, correctly maps the "extended =" key to the right button and should be used instead.

Using a Flightstick Pro Joystick

The Flightstick Pro Joystick for the Macintosh triggers the System beep 'Indigo' when entering the DOS environment. It also triggers this sound twice upon bootup. To correct this, remove the Indigo sound from the System file in the Macintosh System Folder.

Bypassing the CONFIG.SYS and AUTOEXEC.BAT files

To bypass these DOS startup files during the startup process, press and hold the F5 key (Command-5 on non-extended keyboards) after the memory testing is complete.

Installing Corel Draw

If you allow Corel Draw to update the AUTOEXEC.BAT file, the line:
LH C:\Apple\MacShare

is replaced with the line:
C:\DOS\SHARE.EXE /L:500 /F:5100

If the former line is needed, you should edit the AUTOEXEC.BAT file to add it back.

Using Norton Utilities

If Norton Utilities for the Macintosh v3.0 or v3.1 is being used, the "More Compatible" option should be chosen:

1. Go into Control Panels and open FileSaver
2. Click More Choices
3. Click Preferences and Update Now
4. Click More Compatible
5. Click Save

Installing Microsoft Office, Word, or Excel

When you install Microsoft Office 4.2c or later, Microsoft Word 6.0c or later, or Microsoft Excel 5.0c or later, make sure that you use a CD-ROM installation disc or floppy disks that are non-DMF. (DMF is Distribution Media Format, Microsoft's recently changed installation disk format. DMF disks store 1.7 MB of

data rather than the 1.44 MB on a single 3.5 inch high-density disk. During installation with DMF disks, an error will be reported when installing the second disk, and you won't be able to complete the installation.)

Non-DMF installation disks can be obtained from Microsoft by calling 1-800-426-9400.

Amendments to Appendix E of the Macintosh User's Guide

On page 164 of the Macintosh User's Guide, certain steps may not exactly apply to more recent versions of the Novell Netware Client disk set. For steps 4 through 7 of the procedure in the manual, all that matters is that the following exceptions apply:

The Netware directory is: C:\NWCLIENT

The LASTDRIVE setting in the CONFIG.SYS file is: LASTDRIVE=Z

The AUTOEXEC.BAT file contains the line: CALL C:\NWCLIENT\STARTNET.BAT

And be sure to load the Windows support in the directory where you have loaded Windows.

In steps 5 and 6, the defaults are already preset; you should not be required to edit the CONFIG.SYS file to set the LASTDRIVE setting or the AUTOEXEC.BAT file to add the CALL line.

In steps 8 through 10 of the same procedure: Step 8 should read "To select the driver for the network board, press return". The disk required in step 9 is the "DOS Compatibility Installer Disk for PC Environment" disk that came with your computer. In step 10 select the "Macintosh DOS Compatible Ethernet Adapter" and press return.

In the section entitled "Conserving Memory", you should not need to edit the AUTOEXEC.BAT file. The CALL line should already be included.

Using SAM 4.0

When using SAM 4.0 for the Macintosh with the "Prompt: 'Skip' is the default button" check box selected in the Floppy Drive preferences, inserting a floppy while in the PC environment causes the system to hang. The floppy cannot be accessed nor can the user switch to the Macintosh environment. To avoid this, select the "Always scan" option.

SAM Intercept v4.0.2 Virus Checking

If you have SAM Intercept 4.0.2 running on your LC630 DOS Compatible, and you attempt to mount a drive container on the desktop, the mouse cursor will indicate that you have control when, in fact, you do not. (SAM Intercept is checking the drive container for viruses but has not displayed the spinning "beach ball" cursor.) It takes approximately two minutes to complete the virus scan, after which the LC630 DOS Compatible will function normally. Version 4.0 of SAM Intercept does not exhibit this behavior.

To avoid this delay, turn off the autoscan feature as follows:

1. Launch the SAM Intercept program
2. Select "Scan" in the "Options" menu
3. Deselect the "Scan for known viruses" option.

Reinstalling DOS/Windows Software - WB.EXE File

Should it become necessary for you to re-install the DOS/Windows software, you will also need to install the WB.EXE file for execution when DOS boots. To install WB.EXE on the LC630 DOS Compatible follow these steps from the Macintosh desktop:

1. Select the PCSetup control panel and select "Shut Down PC".
2. Open the PC drive container, located on your internal hard drive, by double clicking the file "PC Drive File".
3. A hard drive icon labeled "PC BOOTDISK" will appear on the desktop. Double-click PC BOOTDISK to open the volume.
4. Insert the disk labeled "DOS Compatibility Installer Disk for PC Environment". Double-click on the diskette icon to open the main window and locate the file WB.EXE.
5. Drag it to the folder labeled "Apple".
6. When the Macintosh is finished copying the WB.EXE file, press command-Return.
7. When DOS has finished booting, type:

```
EDIT C:AUTOEXEC.BAT
```

8. Add the following line to the end of the AUTOEXEC.BAT file:

```
C:\APPLE\WB.EXE
```

9. Press Option-f to select the file menu.
10. Select the Exit option (using the up-arrow key) and press Return.
11. Press return again to save the AUTOEXEC.BAT file and exit the DOS editor.
12. At the DOS prompt type Command-Return to re-enter the Macintosh desktop.
13. Unmount the PC drive container by dragging the PC BOOTDISK icon to the Trash.
14. Select "Shut Down PC" in the PCSetup control panel.
15. Start the PC using the PCSetup control panel or by pressing Command-Return.

The WB.EXE program runs and exits when DOS boots. It does not stay resident in memory. The WB.EXE program enables the write back mode and prints a string that reads:

```
"WB.EXE Enable CPU internal cache to Write-Back.", and exits.
```

Printing

For DOS or Windows printing on the DOS Compatibility Card, we recommend using LPT1.DOS or LPT1. In general you must use printers that are Macintosh

compatible, and use their corresponding printer extension for the Macintosh, selectable in the Chooser. However, in a PC Novell Netware environment you can print to a PC-compatible printer attached to a Novell network (refer to the Network Installation Guide on how to set up a Novell client).

Printing to a Postscript Printer

If you have a Postscript printer, open the Printers icon in the Windows Control Panel and select a Postscript driver. We recommend the Laserwriter IINT driver or Windows Postscript driver. In the Macintosh Chooser, select the corresponding printer extension for your type of printer.

Printing to a QuickDraw Printer

If you have a QuickDraw (non-Postscript, non-PCL printer) such as an Apple's ImageWriter or StyleWriter, or HP's DeskJet printer:

- Open the Printers icon in the Windows Control Panel and select the Epson LQ-2500 driver.
- In the Macintosh Chooser, select the corresponding printer extension for your type of printer.
- In the Macintosh Extension folder, launch the PC Print Spooler by double-clicking its icon in the Extension folder.
- From the File menu, select "Preferences".
- Click on the Epson option for "Interpret non-Postscript As" to enable the Epson emulator.

The Epson emulator works by first translating the DOS text to a similar Macintosh font, then interpreting that text into a series of QuickDraw commands.

Some characters in the original DOS character set may not have exact translations to a Macintosh font. The use of a PostScript font is recommended in these cases, since use of the PostScript standard requires no translation.

The Epson emulator does not support color or grayscale. When printing from the PC to a Color or Grayscale printer, make sure to select the Black & White option from the Print dialog.

Printing to a PCL Printer

When printing to a PCL (Page Control Language) printer, printing is limited to text-only when printing over an AppleTalk connection. To set up this configuration:

- Open the Printers icon in the Windows Control Panel and select your printer's driver.
- In the Macintosh Chooser, select the corresponding printer extension for your type of printer.
- In the Macintosh Extension folder, launch the PC Print Spooler by double-clicking its icon in the Extension folder.
- From the File menu, select "Preferences".

- Click on the PCL option for "Interpret non-Postscript As" to enable PCL printing.

Additionally, PCL printing of text and graphics together is possible when printing over a Novell network, where a PC print server is connected to the PCL printer and handles the printing job. Select your printer's own driver in the Windows Control Panel.

Sound Control Panel Settings

For sounds generated by the Sound Blaster card and for sounds from the PC, the Sound Control Panel must be set with the Internal CD playthrough enabled. The User's Guide will explain how to make this setting (see pg. 69). With System 7.1.2, however, the setting is lost after each reboot. Install the System Update 3.0 software to correct this problem so that the playthrough setting is retained after each reboot.

QuickTime also turns off the playthrough option. This has the effect of cutting off all PC and Sound Blaster card sounds. QuickTime v1.6.2 will turn off playthrough and not restore it, while QuickTime v2.0 will restore playthrough back to its original state.

Using the Sound Blaster Card

The PC Sound control in the PC Setup control panel does not effect sounds produced by the Sound Blaster card. Only PC-generated sounds such as the system beep are affected by this control. Use the master volume control of the Mixer Control application from the Audio program group, or turn off the Internal CD playthrough to turn off both PC and Sound Blaster generated sounds (see pg. 69 of the User's Guide).

The Sound Blaster daughter-card included on your DOS Compatibility Card will play sounds as expected, but is not able to record them.

The DOS Compatibility Card does not fully support Sound Blaster 8-bit, Sound Blaster 2.0 or Sound Blaster Pro drivers. If problems occur, select the Sound Blaster 16 driver that comes with the DOS Compatibility Card.

Using CD-ROM Drives

Simultaneous use of multiple CD-ROM drives is not supported.

Apple 600i and Apple 600e CD-ROM drives are supported with Apple DOS Compatible cards when used with Apple CD-ROM extension version 5.0.4. Standard installations of System Software 7.5.1 or earlier do not include the Apple CD-ROM 5.0.4 driver. This driver is included with Apple 600e CD-ROM's or can be obtained from Apple Technical Support.

Audio CDs cannot be controlled from both Windows and the Macintosh environment at the same time. One or the other must be used. Photo CD's can not be read on

the PC side of the DOS Compatible.

The PC side sets up a drive letter (E:) for a CD-ROM drive although no drive is attached. If no CD-ROM drive is connected to your system, this drive letter can be freed up (and some memory) by editing these files:

```
AUTOEXEC.BAT
REM  LH C:\DOS\MSCDEX /D:CDDVR /L:E
```

```
CONFIG.SYS
REM  DEVICE=C:\Apple\CDROM.SYS /D:CDDVR
```

Prefacing these commands with "REM" will make DOS ignore them.

Playing an audio CD in Windows while running low-level media tools, such as PC Tools or Microsoft Anti-Virus, may cause a crash. It is best to reduce computer activity to a minimum while using such tools.

Multimedia and Game Applications

These types of applications, whether they are run in the PC or Macintosh environments, will see a marked performance improvement with the installation of a memory SIMM onto the DOS Compatibility Card. QuickTime application performance is especially improved with the addition of a SIMM.

Rebuilding the Desktop

If you need to rebuild the Macintosh desktop, you must either wait for the desktop to rebuild while in the Macintosh environment, or switch to the DOS environment and remain there until the rebuild is complete. Switching back to the Macintosh environment during rebuild will cause the Macintosh to crash.

Using PC Tools Pro 9.0

The CPTASK.EXE utility (Central Point Task Manager) is incompatible with the DOS Compatibility Card.

Using MWUNDEL

MWUNDEL does not work on shared folders, so files deleted by the PC in shared folders will not be recoverable. However, files in shared folders can be recovered if they are deleted from the Macintosh. Use a Macintosh utility such as Norton Disk Doctor.

Using After Dark 3.0

Do not use the PC Setup control panel "Switch at Startup" option when using After Dark. When switching to the PC side, make sure After Dark 3.0 for the

Macintosh is turned off.

Using the Serial Port

If you are using communications software that uses the serial port, the following are known errors:

- For Procomm, the auto-answer mode does not work.
- For LapLink, transferring files between two machines may not work, especially for large files.

PC Exchange 2.0.3: ReadMe File (8/95)

Revised: 10/14/96
Security: Everyone

PC Exchange 2.0.3: ReadMe File (8/95)

=====

Article Created: 09 August 1995

TOPIC -----

This article contains the Read Me file for PC Exchange 2.0.3. This version of the Read Me file was included with the PC Setup 1.0.7 update software package.

DISCUSSION -----

Important Information About Macintosh PC Exchange 2.0

This document contains important information about Macintosh PC Exchange 2.0 (version 2.0.3) that is not included in your user's guide.

IMPORTANT

Macintosh PC Exchange 2.0 requires Macintosh system software version 7.0.1 or later.

What is Macintosh PC Exchange 2.0?

Macintosh PC Exchange 2.0 is a System 7 compatibility utility that lets you use DOS-format disks on your Macintosh. PC Exchange makes it easy to work with DOS data files on your Macintosh and to transfer files back and forth between a Macintosh and a PC-compatible computer simply by copying the files between disks.

Please note that PC Exchange will not translate or convert DOS data files into Macintosh data files. In addition, PC Exchange does not allow you to work with MS-DOS or Windows application programs on your Macintosh.

New Features

Macintosh PC Exchange 2.0:

- now works with DOS-format and Windows-format SCSI fixed and removable media storage devices (such as Iomega Bernoulli and SyQuest cartridge drives).
- now works with Apple II ProDOS-format floppy disks.
- now works with NEC DOS-format 640K floppy disks.
- lets you access DOS-format drive container files created on a Macintosh Quadra 610 DOS-Compatible computer.
- uses minimal random-access memory (less than 5K) when not in use.
- includes an on/off switch in the control panel that allows you to turn off the PC Exchange disk-mounting capability temporarily.
- comes with built-in device drivers to support a wide variety of SCSI hard disk and removable media drives.
- works on Power Macintosh systems in Macintosh 68000 emulation mode.

Software Fixes in Version 2.0.3

- Earlier versions of Macintosh PC Exchange would fail to recognize and display DOS files on DOS-format disks when the filename contained certain international characters. In this new version, DOS filenames containing international characters will be recognized by PC Exchange. However, in most cases, the DOS international characters will be replaced with alternate Macintosh international characters.
- Earlier versions of Macintosh PC Exchange 2.0 would not allow File Sharing to be turned on when a DOS-format hard disk or removable media drive were mounted on the Desktop. This new version will allow you to turn on File Sharing while a DOS-format disk is mounted on the Desktop. However, the DOS-format disk cannot be shared using the File Sharing software.
- Macintosh PC Exchange 2.0.3 now accurately recognizes WorldScript 2-byte character DOS file and volume names.
- When erasing 800K floppy disks on a Macintosh Quadra AV system, the format popup menu would list the Macintosh 800K format option twice. This problem has been corrected in version 2.0.3 of PC Exchange.

Known Problems in Version 2.0.3 of Macintosh PC Exchange

- A "Sad Mac" error may occur on your Macintosh if a removable media cartridge is left in the drive during startup. To keep this problem from occurring, manually eject removable media cartridges from the drive before you turn on your Macintosh.

..TIL18347-PC_Exchange_2-0-3-ReadMe_File_8-95_(TA34222).pdf

- PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files which contain more than one gigabyte of disk space.

SCSI Hard Disk and Removable Media Drives Not Supported

The following disk drives are not supported by Macintosh PC Exchange 2.0:

- Apple 5.25-inch floppy disk drive
- Maxtor 230MB SCSI hard disk drive
- Pinnacle Micro PMO-650 SCSI magneto optical drive

Installation Information

If you have already installed another PC disk-mounting utility on your Macintosh, be sure to remove it before installing Macintosh PC Exchange.

You install Macintosh PC Exchange by dragging the PC Exchange icon into the Control Panels folder of your System Folder and restarting your Macintosh.

NOTE: If you are installing Macintosh PC Exchange on a Japanese Kanji-localized Macintosh system, you must remove the "DOS640K Driver" software extension from your Extensions folder before installing version 2.0.3 of PC Exchange. If you do not remove the DOS640K Driver, you will experience difficulties when trying to read NEC DOS-format 640K floppy disks.

Strange Text Characters in a Document

In some cases your Macintosh application program may not be able to interpret the file format of a PC document. When this happens, the document's formatting is displayed incorrectly and you may see strange characters in the document. Try using a different application program or translate the document into a different file format using one of the file format translation utilities available for the Macintosh (such as MacLinkPlus/Easy Open Translators from DataViz).

Paint Programs

Some paint programs, such as MacPaint and SuperPaint, save documents on DOS-format floppy disks very slowly. To avoid this problem, always save paint documents on your computer's hard disk. If you like, you can then copy the documents to a DOS-format floppy disk.

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with PC Exchange and should not be used while PC Exchange is installed. Macintosh PC Exchange 2.0 contains an easier and more intuitive method for accessing DOS and Apple II ProDOS disks on a Macintosh.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option.

ClarisWorks (Version 1.0v2 or Earlier)

Some versions of ClarisWorks cannot read or write files on DOS-format floppy disks. To open a PC document in ClarisWorks, you must first copy the document to your computer's hard disk. Always save ClarisWorks documents on your Macintosh hard disk. If you like, you can then copy the documents to a PC-format floppy disk. Contact Claris to obtain version 1.0v3 or later of ClarisWorks.

Directory Assistance II

Directory Assistance II should not be used while the Macintosh PC Exchange control panel is open. You can turn off Directory Assistance II from the PC Exchange control panel by holding down the Option key while you click the Add or Change button in the control panel window. Directory Assistance II will be turned off temporarily while you use the PC Exchange control panel and will be reactivated when you close the PC Exchange control panel.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other MS-DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Macintosh, you must decompress the files and save them to a noncompressed DOS-format disk.

Working With PC-Format Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the Macintosh-, DOS-, or ProDOS-format partitions as individual logical drives on the Macintosh Desktop. If the disk contains both Macintosh and DOS-format partitions, PC Exchange will only recognize the Macintosh partition. In addition, PC Exchange will only recognize ProDOS-format partitions on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge to the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Macintosh-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Macintosh, DOS, or ProDOS

partitions, you need to use third-party software designed for partitioning hard disk and removable media drives.

Tips for Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize SCSI removable media devices, you must turn on the device and eject any cartridges before you turn on your Macintosh system.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install it's own device driver for that SCSI device.

The Eject Disk command is unavailable when working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a PC-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. Do not use the MS-DOS Fdisk command to initialize a removable media cartridge. In addition, you should use the MS-DOS Format command to format the disk before you copy DOS files to a newly initialized removable media cartridge on a PC.

When you initialize a removable media cartridge on a PC-compatible computer, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media device. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Tips for Working with DOS-format SCSI Hard Disk Drives

In order for PC Exchange to recognize SCSI hard disk drives, you must turn on the drive before you turn on your Macintosh system.

Do not install the device driver software that came with your SCSI hard disk. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install it's own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk on a PC-compatible computer, use the MS-DOS Fdisk command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS Format command to format and erase the disk before you copy DOS files to a new SCSI hard disk on a PC.

Additions to the User's Guide

If you change the volume name of a DOS-format disk to a name that is longer than 11 characters, the disk name will be shortened when you view it on a PC-compatible computer.

If Macintosh PC Exchange encounters a problem while formatting a floppy disk, an Updating Disk dialog box may appear. This dialog box shows the status of the updating process. To stop the disk from being updated, you can click the Cancel button. This cancels the initialization process and the disk is ejected from the disk drive.

You cannot create an assignment with a blank DOS suffix in the PC Exchange control panel.

Common MS-DOS File Suffixes

.BAK	Backup document (used by word processing programs)
.BAS	BASIC program (cannot be used on a Macintosh)
.BAT	Executable DOS program (cannot be used on a Macintosh)
.BMP	Windows Bitmap graphic
.CDR	CorelDraw graphic
.CGM	Computer Graphics Metafile graphic
.COM	Executable DOS file (cannot be used on a Macintosh)
.CWK	Clarisworks document
.DBF	dBASE database file
.DIF	Data Interchange Format (used by spreadsheet and database programs)
.DLL	Windows Dynamically Linked Library (cannot be used on a Macintosh)
.DOC	Microsoft Word document
.DOX	Multimate v4.0 document
.DWG	Autocad drawing
.DXF	Autocad drawing in exchange format
.EPS	Encapsulated PostScript file
.EXE	Executable DOS file (cannot be used on a Macintosh)
.INI	Windows preference file
.OBJ	Compiled object file (cannot be used on a Macintosh)
.PCC	PC Paintbrush graphics file
.PCX	PC Paintbrush graphics file
.PIC	Lotus 1-2-3 graphics file
.PM3	PageMaker 3.0 document
.PM5	PageMaker 5.0 document
.PM4	Pagemaker 4.0 document
.PRG	dBASE program file (cannot be used on a Macintosh)
.PRN	DOS 'Print' file
.RFT	DisplayWrite Revisable Form Text (DCA format)
.SAM	AmiPro document
.STY	Microsoft Word style sheet
.SYL	SYLK format (used by spreadsheet and database programs)
.SYS	DOS system file (cannot be used on a Macintosh)
.TIF	TIFF graphics file
.TXT	ASCII text file
.WDB	Microsoft Works database

.WKS	Lotus 1-2-3 spreadsheet, version 1
.WK1	Lotus 1-2-3 spreadsheet, version 2
.WK3	Lotus 1-2-3 spreadsheet, version 3
.WMF	Microsoft Windows Metafile
.WP	OfficeWriter or WordPerfect document
.WPF	WordPerfect document
.WPG	WordPerfect graphics file
.WPS	Microsoft Works word processing document
.WQ1	Quattro Pro spreadsheet
.WS	WordStar document
.XLA	Microsoft Excel add-in macro
.XLT	Microsoft Excel template
.XLC	Microsoft Excel chart
.XLM	Microsoft Excel macro
.XLS	Microsoft Excel spreadsheet
.XY	XyWrite document

MacsBug 6.5.2: ReadMe File (8/95)

Article Created: 09 August 1995

TOPIC -----

This article contains the Read Me file included with MacsBug 6.5.2

DISCUSSION -----

About MacsBug 6.5.2
7/26/95

With the 6.5.1 release, we've adopted a newer, hopefully less-confusing version strategy. From now on, each new version of MacsBug will be a "final" version. Thus, the next version will be 6.5.3, the next bug-fix version to 6.5.

•• NOTE •• - MacsBug 6.5.1 was never released, so please be sure to read what changed in that version since it's not repeated here, but is significant.

MIXED MODE STEPPING

You can now step across all Mixed Mode transitions. This means that when you come up to a MixedModeMagic trap, stepping once more lands on the first instruction on the other side, whether it's 68K or PowerPC. Similarly, when you're stepping through PowerPC code that calls the functions CallUniversalProc or CallOSTrapUniversalProc, you will automatically land on the other side of the call. When returning from a 68K routine to PowerPC code or vice-versa, stepping the return instruction will take you back to the caller, whether it's 68K or PowerPC. There should be no instances where stepping takes you into Mixed Mode itself (so if you're debugging Mixed Mode, use another debugger).

Mixed Mode stepping works equally well with accelerated ("fat") resources. If your 68K code loads and calls into a fat resource, you can simply step right into it.

NMIs IN NATIVE CODE

Using the NMI key sequence, you can now interrupt native code execution, and will land on the PowerPC instruction you interrupted. However, due to reentrancy concerns, you cannot interrupt in the middle of Mixed Mode execution, you'll land in 68K code like you used to do with older versions of MacsBug.

BUS ERROR CATCHING ON POWERPC

Bus error handling on the first-generation PowerPC machines (6100/7100/8100) now works. This really wasn't a bug in MacsBug, but I fixed it anyway. The problem was that the sound-in component trashes the bus error vector when it is loaded (this is the case in 7.5 and 7.5.1). MacsBug now takes care of the component load through a magical patch, and fixes up the bus error vector if it becomes damaged. See, MacsBug really is system software.

POWERPC STACK CRAWL

Fixed the infinite loop bug in the "SC" command when walking back over PowerPC->68K switch frames (mentioned in the 6.5.1 release notes).

POWERPC DEBUGGER/DEBUGSTR CALLS

When you execute a Debugger or DebugStr in native code, you should no longer land in the implementation (in InterfaceLib at present), you'll be in your own code right after the branch to the library where they live.

POWERPC STEPPING

Stepping or tracing with a count now works in PowerPC code.

POWERPC REGISTER DISPLAY

When on a PowerPC machine, we now show the current interrupt mask in place of the Memory Manager mode in the left sidebar area (you're always in 32-bit mode). This is shown (and is correct) when in both 68K or PowerPC code.

The current interrupt mask is shown in the PowerPC register set when the "TD" command is used.

Changed "TF" command to show the exponent and sign of each FPR as one component.

REGISTER ASSIGNMENT

You can now set and get A5 when in both 68K and PowerPC code. For the moment, this is the only 68K register you can get to since it's the most useful. This means that macros like "thecport" work regardless of the current instruction set.

The 68020-040 register formerly known as "DFC" (Data Function Code) must now be called "RDFC" so it's no longer hex (nobody cares about this register anyway).

COMMANDS FIXED/ADDED

Added a new command "STAT" and incorporated it into the StdLog macro. It shows lots of useful information you can see on the screen, but have never had an easy way of getting into the log (at least not very concisely). For instance, it identifies the names of all shipping machines that have unique box flag values, shows used stack space, max-used stack space when available, and ResErr/MemErr when they are nonzero.

The "EA" (Exit to Application) and "ES" (Exit to Shell) commands now work when you're in PowerPC code.

The "IR" (Instruction list to Return) command now works in PowerPC code with no address.

"IRP" (Instruction list to Return PowerPC) command has been added.

"GTP" (Go Till in PowerPC code) command has been added.

Restarting (RS/RB) now works in a general way on PCI-based machines. It used to need a box flag table, which was a work-around for early developmental ROMs without a reasonable Gestalt selector to identify that the machine needed a hard reset to restart.

The "DMA" (Display Memory ASCII) command now honors the DITTO mode.

WH COMMAND

When displaying the CFM library an address lives in, we now display the executable and writable status of the section the address is in (if any).

If an address is in low memory, we now say so (instead of saying it's in RAM but not in a know heap).

A-TRAP RECORDING ON QUADRA/PERFORMA 63x AND POWERBOOK 150

It works, and doesn't make your machine crash. I really don't want to tell you why 'cause it would make a great puzzle page.

A-TRAP ACTIONS

A-Trap tracing and recording no longer mask trap values into the A000-A0FF and A800-ABFF range when displaying them, all bits are shown as-is when the trap was executed.

A-Trap trace now shows the name of the real call that was made if the trap is selector-based (dispatched), rather than the trap. This means you'll see traces with information such as "SameProcess" instead of "OSDispatch", which is much more useful.

A-Trap recording and tracing now identifies Enqueue and Dequeue as stack-based traps rather than register-based (they aren't).

A-Trap break, trace, and step-spy logic has been fixed so you can now have combinations of them pending at the same time that actually work. In the past you couldn't have a trace and a break work at the same time, the first one that was activated got precedence. This means you can now have multiple trace ranges and they'll work as well.

Fixed the long-standing (since November 24, 1992, to be exact) bug where you'd land near a TRAP #5D inside MacsBug if you stepped over an A-Trap that had a break action set on it.

Setting an A-Trap break while in PowerPC code works (I was stupid and failed to install the A-Trap dispatcher patch).

68K DISASSEMBLY

When disassembling a MixedModeMagic trap (AAFE) that's at the current 68K PC, we now show the address that you'll land if you step across the mode transition, as well as the destination instruction set.

When disassembling an A-Trap instruction, the comment field now contains the implementation address of the trap, rather than the trap word. It's already shown off to the right anyway.

POWERPC DISASSEMBLY

When disassembling PowerPC code that uses an offset off of R0, we now look up macros for that address. For example, instead of getting this disassembly:

```
lwz r3, 0x064F(0)
```

you'll get:

```
lwz r3, JFlushCache(r0)
```

Throughout PowerPC disassembly all fields are now shown in hex instead of decimal.

The symbol lookup code now lets tracebacks win if they're at the same address as a previously found CFM export. This lets the disassembler munch the embedded data making the disassembly look nicer (and smaller).

The glue sniffer can now identify Microsoft-style cross-TOC glue.

SYMBOL LOOKUP

I drastically sped up CFM/traceback lookups over 6.5.1 so MacsBug is usable again.

Optimized embedded 68K symbol lookup so it's about 10% faster.

MISCELLANEOUS

Fixed all instances (hopefully) where switching ISAs while in MacsBug wouldn't cause the register names to be erased and redrawn. My internal concept of current and previous ISA was a bit loopy.

The syntax error display for all non-repeating commands has been fixed (br, etc.) You'll no longer see the entire help text as one garbled mess. Yeah, it confused me too.

The "explain significance of" feature shows nicer output for slightly-negative numbers (0 to -16M).

The display of "is a bad pointer" only yells about odd pointers on 68000s.

Made internal commands override dcmds of the same name. You can specify a dcmd (only) by putting a "[option-d]" in front of the name (and it should work for Help, too, as in "[option-d]cfm").

Allow "[option-=]" for not-equal (Dave did it, I'll never remember it).

Moved the typographical quotes up by one pixel (to make Greg Robbins happy).

BUILT-IN DEBUGGER PREFS

Fixed Get1xType and Get1xResource to be Get1IndType and Get1IndResource (we've added two macros to let you still type Get1xType and Get1xResource if you really want to).

Replaced PPCJump macro with a more general one. PPCJumpA is now the old "branch absolute" version.

Power Macintosh 6100 DOS Compatible: ReadMe File (5/96)

=====

Article Created: 09 August 1995
Article Reviewed/Updated: 20 May 1996

TOPIC -----

This article contains the Read Me file for the Power Macintosh 6100 DOS Compatible. This version of the Read Me file was included with the PC Setup 1.0.7 update software package.

DISCUSSION -----

Using DOS and Window Applications
With the DOS Compatibility Card for Macintosh

This document contains important information about using your DOS Compatibility Card that is not included in your user's guide.

Contents:

- Using Memory Management Utilities
- Using the Serial Ports on the Macintosh
- Using Video
- Using the Apple Adjustable Keyboard
- Using Backup Programs
- Using MacShare
- Using PC Drives and Partitions
- Using Floppy Disks and CD-ROM Discs
- Installing Microsoft Office, Word, or Excel
- Using the Two-Button Mouse
- Sound Control Panel Settings
- Using the Sound Blaster Card
- Multimedia and Game Applications
- Printing
- Using After Dark 3.0
- Caches
- Serial Port Pinout

Using Memory Management Utilities

If you use a memory management utility such as EMM386 or QEMM, you need to configure it to be compatible with your DOS Compatibility Card.

- If you will be using EMM386 (included as part of DOS) and you don't require expanded memory, set CONFIG.SYS to:

```
DEVICE=C:\DOS\EMM386.EXE NOEMS RAM=D000-EFFF
```

If you require expanded memory, set CONFIG.SYS to:

```
DEVICE=C:\DOS\EMM386.EXE RAM=D000-EFFF FRAME=D000
```

- If you use QEMM, it is recommended that you use the frame option (ST:F):

```
DEVICE=C:\QEMM\QEMM386.SYS RAM ST:F ARAM=B080-B7FF ARAM=C900-DFFF R:1
```

- If you choose to use the Stealth mapping option (ST:M), set CONFIG.SYS to:

```
DEVICE=C:\QEMM\QEMM386.SYS RAM ST:M X=C800-CFFF X=FC00-FCFF X=FE00-FFFF  
ARAM=B080-B7FF ARAM=C900-DFFF R:2
```

For other memory management utilities, configure them so that the only areas in the BIOS that can be mapped to upper memory are from D000 through EFFF.

Make sure you verify that the HIMEM.SYS line in the CONFIG.SYS file has the switch to turn memory testing off. If the HIMEM.SYS line doesn't turn memory testing off, the ROM BIOS may become corrupted when the DOS Compatibility Card is configured for 2 MB of memory:

```
DEVICE=C:\DOS\HIMEM.SYS /TESTMEM:OFF
```

NOTE Apple does not recommend using automated memory configuration utilities with the DOS Compatibility Card because they can require more memory than management utilities you configure manually. They can also be incompatible with the DOS Compatibility Card.

Using the Serial Ports on the Macintosh

The maximum baud rate supported by the DOS Compatibility Card when a COM port is mapped to a Macintosh serial port is 19,200. If you're capturing serial output to a Macintosh file, there is no limit.

Due to the RS-232 implementation of the Macintosh, not all RS-232 signals are available. These signals are not available: Carrier Detect (CD), Data Set Ready (DSR), Request to Send (RTS), and Ring Indicator (RI). If your application or serial device requires these signals, it will not work.

NOTE See "Serial Port Pinout" later in this document for a list of the Macintosh and PC connectors.

The DOS Compatibility Card does not support Carrier Detect (CD). You must configure your communications applications so they do not use CD. Most communications applications can be set to respond to the CARRIER string sent back by most modems.

Using Video

- Correcting Video Synchronization (Video Synch)

Some application programs that write directly to the hardware (especially games) may cause the Apple 13", 14", and 16" monitors to lose video synch when you start the program. If this happens, call the software company to see if one of the following conditions exists:

1. There is a switch to force the application program to make BIOS calls.
2. There is an upgrade available with this feature.

These applications will run on a standard VGA, SVGA, or MultiSync monitor.

- Getting Color on Your VGA Monitor

Due to the way some programs check for color VGA, they may be installed in VGA monochrome. In these cases check the documentation that came with your software to see if there is a setup option to install standard VGA. If the setup option is available, install the software with the standard VGA option. Once a program is installed with standard VGA, it will always display in color.

If you are installing Windows, even though the SETUP program comes up in color, the express setup may install in VGA monochrome. To avoid this you can use the custom setup and verify the video is set to VGA in the configuration screen.

Another way to avoid installing in VGA monochrome is to use the INSTALL.BAT file located on the DOS Compatibility Card Installer (for the DOS Environment) disk. Follow these steps:

1. Run the INSTALL.BAT command, but choose not to install.

The Installer places WINSETUP.BAT and a hardware information file on your C:/ volume.

2. Use the WINSETUP.BAT file to install Windows.

This will force Windows to install in color. You can also use the Windows SETUP program to change the video at any time.

- Using the Video Drivers

Included with your DOS Compatibility Card are video drivers for Windows and third-party applications. These drivers allow you to run Windows with 256 colors at 640 by 480, or if you are using an Apple 16" or VGA display, 16 colors at 800 by 600. Follow these steps:

1. Insert the Display Driver Disk 1 disk in the floppy disk drive while the PC

is in the foreground.

2. From DOS, set the current drive to A by typing:

A:

3. Run the setup program by typing:

SETUP

Follow the instructions on the screen to install the video drivers.

NOTE If you are using an Apple 16" monitor, DOS will always be displayed at 640 by 480 centered on your monitor.

Using the Apple Adjustable Keyboard

If you are using an Apple Adjustable Keyboard, you cannot use key combinations that combine keys from the main keyboard with function keys at the same time (such as shift-F1). For this reason, you cannot restart the DOS Compatibility Card using the Control, Alt, and Delete key combination. If you need to restart the DOS Compatibility Card, use the Reset button in the PC Setup control panel.

Using Backup Programs

To back up the drive files on your Macintosh, either make a copy of the files by duplicating them in the Finder, or use a Macintosh backup application program. Do not use PC backup programs. PC backup programs do not work because the floppy disk drive is controlled by the Macintosh.

Using MacShare

MacShare is a PC application program included with your DOS Compatibility Card software that allows the PC to view Macintosh folders and volumes as drive letters on the PC. MacShare allows as many shared drives as there are drive letters. To specify the number of drive letters, modify your CONFIG.SYS to include a LASTDRIVE statement:

LASTDRIVE=x

x must be a letter between E and Z because the PC reserves drives A through D for its floppy and hard disk drives. For example, if you use M as your LASTDRIVE value, you could have up to nine extra drives (using drives labeled E through M). The CD-ROM driver, if installed, will use one letter.

NOTE Each additional drive letter uses 100 additional bytes of PC memory.

Using PC Drives and Partitions

The PC Setup control panel allows you to use PC SCSI drives and partitions with the DOS Compatibility Card. If you use a PC drive or partition and you have a utility that mounts these devices on the Macintosh, be sure to unmount the drive or partition before starting the PC by dragging its icon to the Trash. If you don't unmount the drive or partition, you may lose data since both the Macintosh and the PC may write to the device at the same time.

NOTE If you are using Apple's Macintosh PC Exchange 2.0 to mount PC devices, the software alerts you if you try booting the PC while the device is mounted.

If you intend to mount your PC drive file, partition, or disk on the Macintosh using a utility such as Apple's Macintosh PC Exchange, do not use a PC compression program. Drives that are compressed cannot be mounted.

Using Floppy Disks and CD-ROM Discs

Simultaneous use of multiple CD-ROM drives is not supported. When the PC is in the foreground, you cannot insert Macintosh floppy disks into the floppy disk drive. The PC ejects a Macintosh floppy disk if one is inserted. Also, Photo CDs can not be read on the PC side of the DOS Compatible.

Apple 600i and Apple 600e CD-ROM drives work with the DOS Compatibility card when used with Apple CD-ROM extension version 5.0.4. Standard installations of system software version 7.5.1 or earlier do not include the Apple CD-ROM 5.0.4 driver. This driver is included with Apple 600e CD-ROMs or can be obtained from Apple Technical Support.

Write-protected PC floppy disks can be accessed by both the PC and the Macintosh. Write-enabled floppy disks can be accessed only by the environment that was in the foreground when the floppy disk was inserted.

To eject a floppy disk while the PC is in the foreground, press Command-E.

NOTE Using Command-E works only when the PC can access the floppy disk. Otherwise switch to the Macintosh and eject the floppy disk from the Macintosh.

CD-ROM discs can be accessed by both the Macintosh and PC (if the included PC software is installed). To eject a CD-ROM disc from the PC, press Command-Y. If the CD-ROM disc cannot be ejected (because a file is in use or the CD-ROM is being shared), the Macintosh beeps to notify you and will not eject the CD-ROM disc.

Audio CDs cannot be controlled from both Windows and the Macintosh environment at the same time. One or the other must be used.

The PC side sets up a drive letter (E:) for a CD-ROM drive although no drive is attached. If no CD-ROM drive is connected to your system, this drive letter (and some memory) can be freed up by editing these files:

```
AUTOEXEC.BAT
REM LH C:\DOS\MSCDEX /D:CDDVR /L:E
```

```
CONFIG.SYS
```

```
REM  DEVICE=C:\Apple\CDROM.SYS /D:CDDVR
```

Prefacing these commands with "REM" will cause DOS to ignore them.

Playing an audio CD in Windows while running low-level media tools, such as PC Tools or Microsoft Anti-Virus, may cause a crash. It is best to reduce computer activity to a minimum while using such tools.

Installing Microsoft Office, Word, or Excel

When you install Microsoft Office 4.2c or later, Microsoft Word 6.0c or later, or Microsoft Excel 5.0c or later, make sure that you use a CD-ROM installation disc or floppy disks that are non-DMF. (DMF is Distribution Media Format, Microsoft's recently changed installation disk format. DMF disks store 1.7 MB of data rather than the 1.44 MB on a single 3.5 inch high-density disk. During installation with DMF disks, an error will be reported when installing the second disk, and you won't be able to complete the installation.)

Non-DMF installation disks can be obtained from Microsoft by calling 1-800-426-9400.

Using the Two-Button Mouse

The standard Apple mouse has no right button and users must press the "extended =" key whenever they intend to use right button functions in one of their PC applications. However, users of a third party programmable mouse or trackball, such as Kensington Turbo Mouse 4.0 or Logitech MouseMan ADB, can use the utilities included with their mouse to map the "extended =" key to the right hand button.

The Kensington Turbo Mouse 4.0 includes two utilities to configure its buttons. They are: "Turbo Mouse Control 4.0.2" and "Turbo Mouse Basics 4.0.2". "Turbo Mouse Control 4.0.2", an application that requires an extension, does not effectively map the "extended =" key to the right button and should not be used.

"Turbo Mouse Basics 4.0.2", a control panel, correctly maps the "extended =" key to the right button and should be used instead.

Sound Control Panel Settings

For sounds generated by the Sound Blaster card and for sounds from the PC, the Sound Control Panel must be set with the Internal CD playthrough enabled. The User's Guide will explain how to make this setting (see pg. 54). With System 7.1.2, however, the setting is lost after each reboot. Install the System Update 3.0 software to correct this problem so that the playthrough setting is retained after each reboot.

QuickTime also turns off the playthrough option. This has the effect of cutting off all PC and Sound Blaster card sounds. QuickTime v1.6.2 will turn off playthrough and not restore it, while QuickTime v2.0 will restore playthrough

back to its original state.

Using the Sound Blaster Card

The PC Sound control in the PC Setup control panel does not effect sounds produced by the Sound Blaster card. Only PC-generated sounds such as the system beep are affected by this control. Use the master volume control of the Mixer Control application from the Audio program group, or turn off the Internal CD playthrough to turn off both PC and Sound Blaster generated sounds (see pg. 54 of the User's Guide).

The Sound Blaster daughter-card included on your DOS Compatibility Card will play sounds as expected, but is not able to record them.

The DOS Compatibility Card does not fully support Sound Blaster 8-bit, Sound Blaster 2.0 or Sound Blaster Pro drivers. If problems occur, select the Sound Blaster 16 driver that comes with the DOS Compatibility Card.

Multimedia and Game Applications

These types of applications, whether they are run in the PC or Macintosh environments, will see a marked performance improvement with the installation of a memory SIMM onto the DOS Compatibility Card. QuickTime application performance is especially improved with the addition of a SIMM.

Printing

The recommended print driver to use with your DOS or Windows application when printing to a QuickDraw (non-PostScript) printer is the Epson LQ-2500.

If the top and bottom of your document gets clipped when you are printing from your PC, follow these steps:

1. Double-click the System Folder on your Macintosh and open the Extensions folder.
2. Double-click the PC Print Spooler.
3. Choose Preferences from the File Menu.
4. Click the button for "Gaps between pages (60 lines)" (under "When emulating an Epson printer").

You can also set notification and status options in this dialog box.

For DOS or Windows printing on the DOS Compatibility Card, we recommend using LPT1.DOS or LPT1. In general you must use printers that are Macintosh compatible, and use their corresponding printer extension for the Macintosh, selectable in the Chooser. However, in a PC Novell Netware environment you can print to a PC-compatible printer attached to a Novell network (refer to the

Network Installation Guide on how to set up a Novell client).

Printing to a Postscript Printer

If you have a Postscript printer, open the Printers icon in the Windows Control Panel and select a Postscript driver. We recommend the Laserwriter IINT driver or Windows Postscript driver. In the Macintosh Chooser, select the corresponding printer extension for your type of printer.

Printing to a QuickDraw Printer

If you have a QuickDraw (non-Postscript, non-PCL printer) such as an Apple's ImageWriter or StyleWriter, or HP's DeskJet printer:

- Open the Printers icon in the Windows Control Panel and select the Epson LQ-2500 driver.
- In the Macintosh Chooser, select the corresponding printer extension for your type of printer.
- In the Macintosh Extension folder, launch the PC Print Spooler by double-clicking its icon in the Extension folder.
- From the File menu, select "Preferences".
- Click on the Epson option for "Interpret non-Postscript As" to enable the Epson emulator.

The Epson emulator works by first translating the DOS text to a similar Macintosh font, then interpreting that text into a series of QuickDraw commands.

Some characters in the original DOS character set may not have exact translations to a Macintosh font. The use of a PostScript font is recommended in these cases, since use of the PostScript standard requires no translation.

The Epson emulator does not support color or greyscale. When printing from the PC to a Color or Grayscale printer, make sure to select the Black & White option from the Print dialog.

Printing to a PCL Printer

When printing to a PCL (Page Control Language) printer, printing is limited to text-only when printing over an AppleTalk connection. To set up this configuration:

- Open the Printers icon in the Windows Control Panel and select your printer's driver.
- In the Macintosh Chooser, select the corresponding printer extension for your type of printer.
- In the Macintosh Extension folder, launch the PC Print Spooler by double-clicking its icon in the Extension folder.
- From the File menu, select "Preferences".
- Click on the PCL option for "Interpret non-Postscript As" to enable PCL printing.

Additionally, PCL printing of text and graphics together is possible when printing over a Novell network, where a PC print server is connected to the PCL printer and handles the printing job. Select your printer's own driver in the Windows Control Panel.

Using After Dark 3.0

Do not use the PC Setup control panel "Switch at Startup" option when using After Dark. When switching to the PC side, make sure After Dark 3.0 for the Macintosh is turned off.

Caches

Your DOS Compatibility Card works best with the Macintosh computer's caches enabled. Follow these steps to enable the caches:

1. Choose Control Panels from the Apple menu.
2. Open the Cache Switch control panel.
3. Click the button for Faster (caches enabled).
4. Close the Cache Switch control panel.

Serial Port Pinout

To connect existing PC serial devices to your Macintosh, you need cables with the correct pinout. The following chart matches the Macintosh pin (Mac Mini DIN-8) with the corresponding PC pin (DB-25):

Begin_Table

Mac Signal	Mac Mini DIN-8	DB-25	RS-232 Name
-----	-----	-----	-----
HSK _o	1	20	DTR
HSK _i	2	5,8	CTS, DTS
TXD-	3	2	TXD
GND	4	7	GND
RXDA-	5	3	RXD
TXDA+	6	N/C	
GPI	7	N/C	
RXD+	8	7	GND

At Ease: Are Hot Keys Still Active? (8/95)

Revised: 8/9/95
Security: Everyone

At Ease: Are "Hot Keys" Still Active? (8/95)

=====

Article Created: 09 August 1995

TOPIC -----

Will At Ease 3.0 for Workgroups or At Ease 2.0.3 prevent the hot key from switching a Macintosh with a DOS Compatible card to the DOS side?

DISCUSSION -----

Although At Ease will prevent you from launching a control panel, At Ease will not prevent hot keys from being activated. The purpose of a control panel is to give functionality to the Macintosh and if the functionality includes the use of a hot key, only the control panel can set whether or not it is active. However, for security reasons, At Ease does disable the space bar hot key from opening the Extensions Manager at startup time.

Currently, the hot key to toggle between Macintosh and DOS cannot be disabled (only changed) and therefore if PC Setup is loaded at startup time the hot key will be active.

Other Apple control panels that are activated or affected by hot keys are WindowShade, Easy Access, CloseView, and Keyboard. The hot keys are active if the control panel loads at startup time and the hot keys are required to use or activate that control panel.

Megaphone: Caller Hears Me, I Can't Hear Them (5/96)

Revised: 5/23/96
Security: Everyone

Megaphone: Caller Hears Me, I Can't Hear Them (5/96)

Article Created: 10 August 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

This article gives suggestions for troubleshooting a problem encountered when using the MegaPhone software. After establishing a telephony connection with another person, you cannot hear the other party, but they can hear you.

DISCUSSION -----

This appears to be a conflict between the telephony software and the External CD Sound extension. The External CD Sound extension allows you to connect an external CD-ROM player and play audio CD-ROM discs through the internal speaker. See the TIL article "System 7.5: What The External CD Sound Extension Does" for more information on what this extension does.

You can work around this issue by disabling the External CD Sound extension by either removing it from your Extensions folder in your System Folder or using the Extensions Manager control panel to turn it off. In either case, you will have to restart your Macintosh before the changes will take effect.

You should also make sure that the Internal Modem Sound extension is present in your Extensions folder. If you have a Macintosh Performa 5300 or 6300 series computer, or have installed the Audio Volume Installer update, instead of the Internal Modem Sound extension, you should verify that the Audio Volume extension has not been removed.

The appropriate file can be found on your startup disc using the path: Hard Disk Files -> System Software files -> Extensions ->.

Once you copy the file to your hard disk, drag the file over your closed System Folder. Click OK when the system software asks to place the file in its proper folder.

Since your Performa has an internal CD-ROM drive, the presence or absence of the

External CD Sound extension should not affect the operation of the computer. If you want to hear audio CD-ROM discs played on an external CD-ROM player through your computer's internal speaker, you will have to reinstall the External CD Sound extension or turn it back on in the Extensions Manager and restart.

Article Change History:

Quicktime 2.0: About QuickTime Extras ReadMe File (8/95)

Revised: 8/10/95
Security: Everyone

Quicktime 2.0: About QuickTime Extras ReadMe File (8/95)

=====

Article Created: 10 August 1995

TOPIC -----

This article contains the Read Me file included with the Quicktime Extras folder in the new Power Macintosh 7200, 7500, 8500, and 9500 computers.

DISCUSSION -----

Welcome to QuickTime

The QuickTime system software extension enables you to integrate graphics, sound, video, text, music, and animation into documents. By providing a standard way for all Macintosh programs to control these multimedia elements, QuickTime makes them easier to use. QuickTime 2.0 includes support for larger, smoother, video, as well as time-code, 16-bit audio compression, and MPEG. It also includes support for synthesized music.

You do not interact directly with the QuickTime extension. It works behind the scenes as part of your system software, providing new features to application programs that support QuickTime. The specific features of QuickTime and how they are presented depend on the programs you use.

The QuickTime Extras folder includes:

- sample movie files
- the QuickTime Musical Instruments extension (on the CD)
- Movie Player 1.0

••NOTE: This is not included in the original Read Me file.

The Power Macintosh 7500 and 8500 shipped with MoviePlayer 2.0 on the hard drive. ••

To play sample movies:

To play a sample movie, double-click the movie's icon, then click the Play

button of the Movie Controller.

QuickTime Musical Instruments:

The QuickTime Musical Instruments file contains many musical instrument samples that you can use in QuickTime movies.

To Install QuickTime Musical Instruments:

1. Drag the QuickTime Musical Instruments icons from the CD to your hard disk's System Folder icon (not into the open folder).
2. Click OK in the dialog box that appears.
3. Restart your Macintosh.

For Software Developers:

The QuickTime 2.0 Developer Kit includes tools for creating and editing movies, compressing audio, and adding time code to movies. It also includes sample movies such as music movies, MPEG movies, time-code movies, and technical documentation. It is available from the Apple Programmers and Developers Association (APDA) for \$195.

APDA:

Performa with Backup CD: Where is Apple Backup? (8/95)

Revised: 8/10/95
Security: Everyone

Performa with Backup CD: Where is Apple Backup? (8/95)

=====

Article Created: 10 August 1995

TOPIC -----

I cannot find Apple Backup on my new Performa computer. Was I supposed to receive it?

DISCUSSION -----

Since a backup of all the software that came pre-loaded on your Performa is provided on the Macintosh Performa CD-ROM disc, and making floppy disk backups would require over 100 floppy disks, Apple Backup has been removed from the Summer 1995 release of Macintosh Performa models. This includes the Performa 631, Performa 640 DOS Compatible, 5200 series, and 6200 series computers.

If you need to back up individual files, you can drag-copy the files to floppy disks.

If you need to restore applications or your system software, you can do so from your Macintosh Performa CD, following the instructions in your Macintosh Performa User's Guide. You can also use the search string "performa adj backup" to locate the TIL article: "Performa: Backing Up and Restoring" for additional tips.

PM7200/9500: Virtual Memory On with System CD (3/97)

Revised: 3/13/97
Security: Everyone

PM7200/9500: Virtual Memory On with System CD (3/97)

Article Created: 10 August 1995
Article Reviewed/Updated: 13 March 1997

TOPIC -----

Virtual memory (VM) is turned on when starting up from the Power Macintosh 7200 system CD or the Power Macintosh 9500 CD version 2.0. This prevents Disk First Aid and Drive Setup from performing their operations on the hard drive. The CD titles are "Apple Macintosh CD for Power Macintosh 7200/75 and 7200/90" and "Apple Macintosh CD for Power Macintosh 9500/120 and 9500/132." The part number for the 7200 CD is 691-0415-A, SSW Version 7.5.2, CD Version 1.0 and the part number for the 9500 CD is 691-0738-A, SSW Version 7.5.2, CD Version 2.0.

DISCUSSION -----

Background
=====

Users running Drive Setup while started up from the CD sometimes receive a message that says: "Cannot modify a disk used by Virtual Memory. To turn Virtual Memory off, consult the Macintosh Guide."

When running Disk First Aid while started up from the CD, users sometimes receive a message that says: "Some of the volumes you selected can't be repaired. You cannot repair the startup disk, the Disk First Aid disk, a write protected disk, a disk with open files, or any disk when File Sharing is active. You may still verify these disks."

Product Technical Support has confirmed that this problem occurs on any of the Power Macintosh 7200, 7500, 8500 and 9500 systems when started up from the Power Macintosh 7200 CD or 9500 CD version 2.0.

When the Power Macintosh 7200/75 and 7200/90 CDs were produced, and when the 9500/120 and 9500/132 version 2.0 CDs were produced, virtual memory was inadvertently turned on and set to 33 MB. This preference was stored in the System file on the CD. When users start up with the CD, the system software

saves its 33 MB VM Storage file out to the user's hard disk. Since this VM Storage file is in use, Disk First Aid and Drive Setup are unable to repair or format the hard drive that contains the VM Storage file. Since the System file on the CD is write protected, the VM settings cannot be modified using the Memory control panel from the hard disk when started up from the CD.

Workarounds

=====

Keyboard commands

Step 1

Insert the CD-ROM disc.

Step 2

Choose Shut Down from the Special menu.

Step 3

Hold down the "c" key (lower-case C; if the keyboard has a physical latch for the Caps Lock key, make sure the Caps Lock key is in the "up" position).

Step 4

Start up the computer.

Step 5

Hold down the "c" key until the "happy Macintosh" icon appears.

Step 6

Immediately release the "c" key and hold down either the Command key or the Shift key.

This process is rapid, lasting only about three seconds. Waiting until the "Welcome to Macintosh" screen appears before holding down the Command or Shift key does not work.

Holding down the command key at startup disables virtual memory, while holding down the Shift key at startup disables virtual memory and extensions. In either case, users are able to run Disk First Aid and Drive Setup on the their Apple hard drive.

Create a Disk Tools Disk

Users can also create a Disk Tools disk from the disk images on the CD, and restart their computer from the Disk Tools Disk. Once started up from the Disk Tools disk, users are able to use Disk First Aid and Drive Setup normally.

Rename Hard Drive to Something Other Than "Macintosh HD"

When starting up from the Apple Macintosh CD, the system file on the CD looks for a volume named "Macintosh HD" to store its virtual memory storage file. If the system cannot find a volume by this name, it ignores the internal hard drive, allowing Drive Setup and Disk First Aid to work normally.

Article Change History:

13 Mar 1997 - Changed distribution status.
03 Jan 1996 - Corrected several typos and misspellings.
22 Sep 1995 - Added an additional workaround.

Power Macintosh 7500/8500: Maximum Color Depths (10/95)

Revised: 1/4/96
Security: Everyone

Power Macintosh 7500/8500: Maximum Color Depths (10/95)

Article Created: 10 August 1995
Article Reviewed/Updated: 26 October 1995

TOPIC -----

The Power Macintosh 7500 and 8500 series computers come with 2 MB of VRAM, expandable to 4 MB. The 7500 and 8500 have 4 VRAM DIMM slots (2 in use and 2 available). VRAM DIMMs must be installed 2 at a time. A VRAM upgrade can be accomplished via two third party 1 MB VRAM DIMMs.

DISCUSSION -----

The Power Macintosh 7500 and 8500 series computers have a fast 64-bit data path to VRAM. Both can also support display resolutions of up to 1,280 by 1,024 pixels with 24-bit color of up to 1,152 by 870-pixel resolution.

DIMMs must be 32-bit-wide, 112-pin fast-paged mode with 70ns RAM access time or faster. Do not use the 256K or 512K VRAM SIMMs used in older Macintosh computers.

If your Power Macintosh 8500 computer is equipped with 2 MB of VRAM, you can switch between a monitor and a television, but you cannot view the desktop on both at the same time. For more information regarding video out to television, please refer to page 58 of the "Power Macintosh 8500 Series User's Guide".

The following table defines the maximum color depths available for a given resolution and memory size. Lower color depths are supported down to 8 bit or 256 colors. This is the same information that is reproduced in the guide that comes with each computer -- "Technical Information: Specifications for Power Macintosh 7500 series computers."

NOTE:

The maximum visible number of colors is millions. In the past, Apple has also labeled millions as 24 bit color. On AV and Power Macintosh computers, 24 bit or 32 bit can be used interchangeably to mean support for millions of colors. In some literature, you may see 32 bit shown in place of 24 bit or millions. Think

of this as 24 plus 8: 24 bit for displaying millions of colors plus 8 bit for special uses, such as alpha channel support (transparency, masking, opaque and tranlucent information) and chroma key support.

Begin_Table

Monitor	VIS*	Resolution	2 MB VRAM	4 MB VRAM	Refresh rates	
			maximum** colors	maximum** colors	Vert (Hz)	Horiz (kHz)

Internal HD Format: Cannot See IDE Drives (10/95)

Revised: 10/9/95
Security: Everyone

Internal HD Format: Cannot See IDE Drives (10/95)

=====

Article Created: 11 August 1995
Article Reviewed/Updated: 5 October 1995

TOPIC -----

I have a Performa 6200 series computer. When I startup from my CD-ROM disc and try to run Internal HD Format, I get a message stating that this software will not work on this hard disk and I should use Apple HD SC Setup. Apple HD SC Setup does not recognize the hard drive either which makes sense because the Performa 6200 has an IDE drive. What is wrong?

DISCUSSION -----

A change was made to the way IDE hard drives are formatted during the manufacturing process. IDE drives now include partitioning information, which the Internal HD Format application does not recognize. When the Internal HD Format application checks the partitioning information, it does not recognize the format and, by default, reports that the hard disk is a SCSI drive, thus it displays the error message referring you to Apple HD SC Setup.

This problem can occur on any IDE hard drive-equipped computer, including the Power Macintosh 5200 series, Power Macintosh 6200 series, Macintosh 630 family, and Macintosh 580 family of computers.

The Drive Setup utility that originally shipped on System 7.5.2 computers is able to correctly reformat these IDE hard drives without any problem. Drive Setup 1.0.2 is available on online services.

Once you have downloaded the file, you can use it to reformat your hard disk by following these steps:

WARNING: Reformatting or reinitializing your hard drive erases all information on your disk. Make sure you have a backup of all files you may have created and any preinstalled software that came with your computer.

Step 1

Copy the Drive Setup utility to a 3.5 inch Macintosh-formatted floppy disk.

Step 2

Insert your Macintosh Performa CD. Restart the computer, while holding down the C key on your keyboard. Once the computer has finished starting, confirm that the Performa CD is the topmost item in the upper right corner of your screen. This means its system software is running your computer.

Step 3

Insert the floppy disk containing Drive Setup 1.0.2. Double-click the floppy disk icon to open it. Double-click on the Drive Setup utility in the floppy disk window.

Step 4

Select the name of your internal hard disk (its type is IDE, and its name is normally Hard Disk).

Step 5

Click on the Initialize button. A second dialog appears, asking for confirmation.

Step 6

Click on Initialize again to confirm that you do want to initialize the hard drive.

AppleVision 1710AV Display: Control Modules on a PowerBook 8/95

Revised: 8/11/95
Security: Everyone

AppleVision 1710AV Display: Control Modules on a PowerBook 8/95

=====

Article Created: 11 August 1995

TOPIC -----

How do I get the new control strip modules that come with the ApppeVision 1710AV display onto a PowerBook?

Do the control strip modules only work with the 1710AV display?

DISCUSSION -----

You can run the installer from the original AppleVision 1710AV Display disks to install the Monitor BitDepth and Monitor Resolution Control Strip modules on your PowerBook.

Alternatively, you can drag the two Control Strip modules into the Control Strip Modules folder in your System Folder. You also need to drag the Display Enabler v2.0 or later into the Extensions folder of your System Folder. You need to restart your computer for the modules to show up in the Control Strip.

These modules work with all displays including the PowerBook on-board display.

Power Macintosh 5300/100 LC: Description (1/96)

Revised: 1/19/96
Security: Everyone

Power Macintosh 5300/100 LC: Description (1/96)

Article Created: 11 August 1995
Article Reviewed/Updated: 19 January 1996

TOPIC -----

This article contains a description of the Power Macintosh 5300/100 LC computer.

NOTE: This computer is only available through educational channels.

DISCUSSION -----

Overview
=====

The Power Macintosh 5300/100 LC is a Power PC processor-based multimedia workstation for the educational market. With this introduction, Apple delivers its most powerful technology to education. By uniting a high-speed, high-performance RISC processor with advanced multimedia features in an innovative all-in-one design, Apple has created the most advanced multimedia workstation for educators and students available today.

Apple, the number one worldwide vendor of multimedia systems, has been a pioneer in the integration of multimedia capabilities into its Macintosh personal computers. With the introduction of the Power Macintosh 5300/100 LC, educators can take advantage of the power of multimedia in a system designed especially for schools. Its PowerPC 603e processor not only provides the high performance required for multimedia authoring and playback, but also optimizes other curriculum and classroom productivity applications.

An extremely powerful system right out of the box, the Power Macintosh 5300/100 LC also offers room to grow. With two expansion slots--including one that can be used to add a low-cost, high-speed, Ethernet networking connection--this system is not only extremely useful today, but is an investment in the future as well.

The announcement of the Power Macintosh 5300/100 LC follows the April 1995

introduction of the highly successful Power Macintosh 5200/75 LC, which was the first Power Macintosh designed specifically for education.

The Power Macintosh 5300/100 LC features a 100 MHz PowerPC RISC 603e processor with 256K Level 2 Cache, 16 MB of RAM (expandable to 64MB) and a 1.2 GB hard disk drive. It also includes an Apple SuperDrive floppy disk drive, two expansion slots--including one that can be used to add a low-cost, high-speed Ethernet networking connection, and an internal AppleCD 600I Plus tray-loading quad-speed CD-ROM drive. Built-in multimedia technologies include a video-out connector, video capture card, TV tuner, and 16-bit stereo sound in and out.

Features

=====

Power and Speed

- 100-MHz PowerPC 603e processor with 256K Level 2 Cache

Memory and Storage

- 16MB of RAM (expandable to 64MB)
- 1 MB DRAM frame buffer (separate from RAM) for video memory, not expandable
- Apple SuperDrive floppy disk drive (reads and writes Mac OS, Windows, DOS, OS/2, and ProDOS files)
- Internal 1GB hard disk drive
- Internal AppleCD 600i Plus tray-loading quad-speed CD-ROM drive

Display

- 15-inch multiple-scan color display (supports more than 32,000 colors)

Expansion

- Macintosh LC-compatible processor direct slot
- I/O communications slot for Ethernet networking (accepts Twisted Pair, Thin Coax, or AAUI Ethernet Cards)

Built-in Multimedia Technologies

- Video-out connector for connecting to an LCD projection panel or a second monitor
- Video capture card lets you record video from camcorder, VCR, or laserdisc
- Built-in TV Tuner
- 16 bit sound in/out

System Software

- System 7.5.1 with Apple Guide, Drag and Drop, AppleScript, Macintosh PC Exchange, Macintosh Easy Open, and more

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server
- Optional Ethernet networking with Ethernet card

Ordering Information

=====

Power Macintosh 5300/100 LC 16/1.2 GB

- Power Macintosh 5300/100 LC (16/1 GB) with built-in 15-inch multiple-scan color display, AppleCD 600i Plus CD-ROM drive, stereo speakers, microphone, MVP, video-in option, AppleDesign Keyboard, and mouse.
- M4364LL/A

Article Change History:

19 Jan 1996 - Corrected bundle information.

25 Oct 1995 - Corrected System Software requirements.

05 Oct 1995 - Added video memory information.

Power Macintosh 7500/8500: Geoport Clock Connector (8/95)

Revised: 8/11/95
Security: Everyone

Power Macintosh 7500/8500: Geoport Clock Connector (8/95)

=====

Article Created: 11 August 1995

TOPIC -----

What is the purpose of Geoport Clock Connector on the logic boards of the Power Macintosh 7500 and 8500 computers? Does it make the Geoport perform at a faster clock speed?

DISCUSSION -----

The Geoport Clock Connector has nothing to do with updating the Geoport to higher clock speeds. This connector is used by Peripheral Component Interconnect (PCI) cards that perform some type of network interaction with the Geoport. It provides the network clock to which the Geoport is talking. Most of the PCI cards that utilize the Geoport Clock Connector are some type of video conferencing cards, such as the H.320 card.

Apple added the Geoport Clock Connector to the logic board because not all PCI cards are physically connected to the network. Without this physical connection the PCI cards would have a difficult time synching with the network clock. If, on the other hand, the network is directly connected to the PCI card, the Geoport Clock Connector is not used at all. By synching to the network clock, the PCI card can determine what kind of timing is needed to execute certain sequences or to provide a refresh to the screen.

There are three pins in the Geoport Clock Connector. One pin is the ground. The other two pins are signal pins. The two signal pins are Serial Clock (SCLK) and Transmit Handshake (TxHs). The GeoPort specification recommends that the GeoPort device provide network synchronized clocking on either SCLK or TxHs. The H.320 card, for example, can then use the appropriate signal to synchronize its video and audio compression/decompression processing to the network.

LaserWriter 16/600 PS: Resetting Using UNIX (8/95)

Revised: 8/15/95
Security: Everyone

LaserWriter 16/600 PS: Resetting Using UNIX (8/95)

=====

Article Created: 14 August 1995
Article Reviewed/Updated: 15 August 1995

TOPIC -----

This article describes how to change subnet mask of the LaserWriter 16/600 from a UNIX workstation.

DISCUSSION -----

Follow these steps to reset the LaserWriter 16/600 PS to its default values using UNIX:

Step 1

Remove the printer and a UNIX workstation from the network.

Step 2

Connect the UNIX workstation directly to the printer

Step 3

Terminate both ends of the connection between the workstation and the printer.

Step 4

Set the subnet mask on the workstation to be the same as the printer.

Step 5

Set the default gateway on the workstation to the IP address of the printer.

Step 6

Logon onto the printer as normal using TELNET.

Step 7

Select the option to reset to factory specs.

Step 8

Set the work station back to the proper address masking

Step 9

Reconnect all hardware to the network.

Apple Workgroup Server (AWS): DAT Status Lights (8/95)

Revised: 8/11/95
Security: Everyone

Apple Workgroup Server (AWS): DAT Status Lights (8/95)

Article Created: 11 August 1995

TOPIC -----

How do I read the status lights on the DAT drive on the Apple Workgroup Server 95, 80?.

DISCUSSION -----

The front panel has two bi-color lights (LEDs). Green is used to indicate normal operation and Amber is used to imply warning conditions. Pulsing usually shows activity between the drive and the SCSI bus. If the cassette Light (Left) shows steady Amber, this indicates that the cassette is write protected. If the Drive Light (Right) shows steady Amber, this indicates a fault condition.

The following table lists the possibilities:
Begin_Table

	Cassette Light	Drive Light	Meaning
Read /Write States	Pulse Green Green Green Green	Pulse Green Green Pulse Green Off (No Light)	Cassette (Unloading) Cassette Loaded/Online Cassette Loaded/Activity Cassette Loaded/Offline
Write- Protect Status	Pulse Amber Amber Amber Amber	Green Green Pulse Green Off (No Light)	Casette (Unloading) Cassette Loaded/Online Cassette Loaded/Activity Cassette Loaded/Offline
Error States	Green Amber	Pulse Amber Amber	Media Wear (Caution) High Humidity, No termination on SCSI bus

	Pulse Amber	Pulse Amber	Self Test (Normal)
	Pulse Amber	Amber	Self Test (Failure)
-----	-----	-----	-----
Other States	Off (No Light)	Off (No Light)	No cassette loaded
	Off (No Light)	Green	Error (illegal state)
	Off (No Light)	Pulse Green	Error (illegal state)
	Off (No Light)	Amber	Error (illegal state)
	Off (No Light)	Pulse Amber	Error (illegal state)
	Pulse Green	Off (No Light)	Error (illegal state)
	Pulse Green	Green	Error (illegal state)
	Pulse Green	Amber	Error (illegal state)
	Pulse Green	Pulse Amber	Error (illegal state)
	Pulse Amber	Off (No Light)	Error (illegal state)
	Pulse Amber	Pulse Green	Error (illegal state)
	Green	Amber	Error (illegal state)
	Amber	Pulse Amber	Error (illegal state)
			(Write Protect on)

Power Macintosh: Display Shaking when Changing Color (8/95)

Revised: 8/11/95
Security: Everyone

Power Macintosh: Display Shaking when Changing Color (8/95)

=====

Article Created: 11 August 1995

TOPIC -----

When using the Monitors control panel, the Control Strip, or the Sound and Displays control panel to change the color resolution on a 13" Apple RGB Display, the image flashes off and back on during the change in color. The color change is not smooth. As the computer switches colors, the image shakes and jumps as if it was resyncing.

DISCUSSION -----

This behaviour can appear on any model of Power Macintosh including the 7200, 7500, 8500 or 9500 series computers. It has also been known to occur on other Power Macintosh computers. For a particular model of monitor, one display may exhibit the issue while another display may not.

The behaviour depends upon a combination of conditions. The differences can be from a number of factors: CPU clock differences (video circuitry in different models can have different dot clocks and timing circuitry) or component variance (clocks, countdown circuitry, also in circuitry the display). A display that exhibits this issue on one CPU may not exhibit the issue on another CPU.

The issue is cosmetic and no damage is occurring to the CPU or the display. There is no disruption in video sync and systems have stable video signals during the color depth transition.

The image bounce or flash on the display as the color depth is changed is normal for some display and CPU combinations. The display or CPU should not be replaced or serviced. Some combinations may show the effect, but it may not be present on all displays (for a certain model) or all CPUs.

Macintosh: Using 1280x1024 60Hz Resolution (2/96)

Revised: 2/8/96
Security: Everyone

Macintosh: Using 1280x1024 60Hz Resolution (2/96)

Article Created: 11 August 1995
Article Reviewed/Updated: 8 February 1996

TOPIC -----

How can I set a non-Apple display, which is connected to a Macintosh computer, to a resolution of 1280x1024 60Hz. My user's guide states that my Macintosh computer should support this VGA display at this setting.

DISCUSSION -----

Sense codes are used so the computer can detect the type of monitor that is connected to the system. The computer only starts up at 1280x1024 scan rates after you have set the monitor control panel and the settings are stored in parameter RAM (PRAM). With no setup information in PRAM, the computer starts at the best scan rate and resolution for the detected display (usually 640x480).

If your display does not support 640x480, you can usually use a multiple scan display to set the higher resolutions. Once that information is stored in PRAM, you can connect the non-Apple display. Since there are no Apple displays that support 1280x1024 60Hz (the Multiple Scan 20 only supports 75Hz), you must use a workaround to set the Monitor control panel to the 60Hz scan rate.

NOTE:

There is a least one third-party company which sells a 60 Hz adapter kit. Using this kit, you can cycle through resolution settings at startup until the proper setting is selected. Using this solution, you do not need to use the workaround provided in this article.

Using a display adaptor, set the display type to VGA/SVGA. Follow the directions in the display adapter's user's guide for the proper instructions for selecting VGA/SVGA.

Powering up the Mac with most third-party display adaptors attached between the display and the Mac video port starts up by default at 640x480 60Hz resolution.

Step 1

Open the Monitor control panel.

Step 2

Hold down the Option key while selecting the 'Options' button in the Monitor control panel. (Normally, 'Options' button will only allow 'safe' operating resolutions. If you hold down the option key on the keyboard when you select the 'options' button in the Monitor control panel, the options panel will also show 'unprotected' scan rates that is supported.)

Step 3

Select the 1280x1024 60Hz resolution.

The video scan rate will change depending on whether you have selected 'Rearrange on Close' or 'Rearrange on Restart' on the bottom of the Monitors control panel window.

If you have selected 'Rearrange on Close' and you select a scan rate currently not supported by an Apple display, you will be prompted with a dialog box asking if the monitor display is correct. If you do not click the OK button within about 10 seconds, the system will assume that you do not have a properly synchronized display and will revert back to the previous scan rate.

Following the above procedure, you should be able to set your display to the 1280x1024 60Hz resolution and scan rate.

Display adapters are available from several third-party companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

NOTE:

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for content referring to those products. Please contact the vendor for additional information.

AppleTalk Remote Access and CNG Modem CCL Scripts (8/95)

Revised: 8/12/95
Security: Everyone

AppleTalk Remote Access and CNG Modem CCL Scripts (8/95)

=====

Article Created: 12 August 1995

TOPIC -----

I'm trying to connect to an AppleTalk Remote Access (ARA) Server 2.x with my PowerBook Duo and Express Modem using Telecomm 2.0 software. The Remote Access Status Window shows I'm communicating at 14.4 kbps, but then gives me the following error message, "The connection attempt has failed. The modems did not connect properly. Please try again." ARA worked fine with my other PowerBook Duo with an Express Modem using the same password, user name, and software. I have tried a clean install of the Operating System, Express Modem, and ARA software but it still does not work. What is wrong?

DISCUSSION -----

Check your Remote Access Setup control panel to see which ARA CCL script you are using. Sometimes if the modem you are connecting to does not support CNG signals, and you have selected the Express Modem 2.x/CNG in the Access Setup control panel, it will give you this type of error. Simply using the script Express Modem 2.x instead will let you connect.

So what is CNG

When you use the CNG scripts, the Express Modem will transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem instead of a FAX or Voice call, so the call can be routed to the appropriate software supporting the service.

Apple Workgroup Server 95 Read Me (8/95)

Revised: 8/12/95
Security: Everyone

Apple Workgroup Server 95 Read Me (8/95)

Article Created: 12 August 1995

TOPIC -----

This article is the ReadMe Apple Workgroup Server 95 Software upgrade.

DISCUSSION -----

This Read Me file describes the changes made to the Apple Workgroup Server 95 since its original release. You can use the Software Upgrade to upgrade your system either from the original release or from the Tune Up release. This software upgrade includes the following software.

- A/UX 3.1
- AppleShare Pro 1.1 (installed only when an earlier version of AppleShare Pro is found on the system)
- Apple DocViewer 1.1
- Retrospect 2.0Ci

Notes On Installing The Software Upgrade

Installation takes approximately 20 minutes. The installation instructions on the back cover of the Apple Workgroup Server 95 Software Upgrade CD, along with the on-screen messages, will guide you through the installation process. The following notes provide important additional information.

Space Requirements

The software upgrade requires 10 MB of free space on the root (/) volume. To complete the software upgrade process, you temporarily need approximately 20 MB of free space on the / volume. To check the amount of free space available, double-click the icon for the / hard disk. Then, if you aren't already viewing the window by icons, choose By Icon from the View menu. The amount of available space on / is shown in the upper-right corner of the window that displays the

contents of /.

Before Installing, Check Your Applications Folder

Before installing the upgrade software, make sure that the following applications reside in the Applications folder on the root (/) volume; successful upgrading of these applications depends on it: AppleShare Pro Admin, AppleShare Pro File Server, Retrospect, TextEditor, Apple HD SC Setup, and Apple DocViewer

Note that the Applications folder name starts with a leading space: "<space>Applications". If you change the name of the folder that contains the these applications, you must include the leading space at the beginning of the name for the upgrade to install completely.

Prompts for Older Versions

You will be prompted to replace newer versions of the LaserWriter and Chooser files on the root (/) volume with older ones; the older version is actually newer -- the creation dates on these files were incorrect in the original AWS 95 software.

Preferences in A/UX Startup

The upgrade software returns the preferences to their default settings. If you had modified the settings in the Preferences menu in the A/UX Startup application, you'll need to reenter your settings. These preferences determine whether A/UX automatically boots upon startup, the command that the system runs to check the root file system at startup time, whether parity checking is enabled, etc.

User Accounts on the Server

If you have created user account(s) on your server, and given them personal system folders, you must manually update the personal system folder for each user account after installing your system software. To update a personal system folder, log in to the user account and start the AWS 95 Upgrade Installer application. Use the Custom Install option to install the package "AWS 95 A/UX System Folder Upgrade" to the personal system folder for that account. This must be done for each personal system folder on your server.

Size of the A/UX Buffer Cache

If you had previously adjusted the size of the A/UX buffer cache on your server, check that your setting has not been changed by the installation procedure. If it has been changed, you'll need to reenter it.

Re-linking On-line Manuals

After completing the software upgrade, you may need to re-link the on-line manuals in the new DocViewer collection document called "AWS 95 Documentation." To re-link the files, open the collection document in the Documentation folder. Then double-click on one of the on-line manuals. When the "can not be found"

dialog box appears, click the Locate button. Locate the DocViewer file, then use the Save command from the File menu to save the collection document. Repeat this procedure for each on-line manual in the collection document.

Network Launch Fix File

You'll notice a file called Network Launch Fix on your AppleShare Pro CD. This file fixes a bug that affects AppleShare client machines of the Macintosh Quadra, Centris, and Performa 470 series of computers (which all have the 040 microprocessor). You don't need to add this file to client machines other than the 040 series, or to your server.

GENERAL NOTES

=====

The upgrade software improves performance in several areas, including a 400 percent increase in the speed of AppleShare Pro over AppleShare 3.0 in certain areas. See the new guide, "Tuning Server Performance and Adding Internal Drives" to learn about measuring and tuning the performance of your Apple Workgroup Server 95.

Software Enhancements

-
- The "config_server" script for preparing the system for database or file and print services.
 - UNIX Library for AppleTalk Printer Access Protocol (PAP) servers.
 - Support for UNIX file systems of 4 GB in size (AppleShare Pro is limited to 2 GB)
 - A version of sendmail that offers more security.
 - The capability to disable the autologin feature by pressing CONTROL-X when the system is about to start the Finder environment.

Hardware Enhancements

-
- Support for automatic mounting and unmounting of removable media SCSI drives from the Finder.
 - The Apple Ethernet NB Twisted-Pair Card.
 - Support for up to five internal hard drives, and for the 2 GB Apple internal drive.

A/UX Buffer Cache Default

The setting of -1 is still the default setting for the server offering file and print services. However, the action triggered by this setting has been changed to prevent the occurrence of paging of virtual memory when AppleShare Pro and Retrospect are run simultaneously.

Don't Install CD-ROM Driver Files

CD-ROM driver files are delivered with Apple CD-ROM drives and with third-party drives. Don't copy these files to your A/UX System Folders; installing these drivers is unnecessary and will prevent your system from starting up the Finder

environment.

Apple 2 GB Drive at System Startup

If your server is equipped with an Apple 2 GB hard drive, there is a slight chance that the system software might check for the hard drive before the drive has reached full speed, and as a result, the system might not start up correctly. If this situation arises, no icon for the startup disk will appear. Restart your system; the hard drive will be recognized the second time.

Symbolic Links Changed to Increase Security

To increase system security when AppleShare Pro is running, a change has been made to the behavior of symbolic links when the symbolic link involves files in more than one folder. The change causes the check for access permissions to treat the Macintosh environment as having the level of permissions of "NOBODY". This change affects the Finder and Macintosh applications, only occurs when AppleShare is running, and does not affect the CommandShell application.

Some MacDriver Partitions Incorrectly Recognized

Apple Computer has recently released HD SC Setup Version 7.2.2. This version of the disk partitioning application creates a MacDriver partition that is not understood as a valid MacDriver partition by the A/UX version of HD SC Setup. (The A/UX version of HD SC Setup is the version used by the AWS 95.) The partition that creates the problem is called MacDriver and has the partition type "Apple Driver43". The misunderstood partition causes the following behavior when using the HD SC Setup application or using HD SC Setup from within the AWS 95 Installer:

- You cannot update the partition; in the main dialog box of HD SC Setup, the Update button is greyed out.
- You can create a second MacDriver partition; after selecting "Partition...", the dialog boxes allow you to create an additional MacDriver partition. If you encounter one of these problem MacDriver partitions, remove it and create a new one using the A/UX version of HD SC Setup delivered with the AWS95.

Limit on File System Check Command

When the Apple Workgroup Server 95 starts up, the fsck command is run from the A/UX Startup application. When the fsck command is run from the A/UX Startup application, it cannot check a file system larger than 2 GB. Therefore, limit the size of your root file system to 2,097,151 KB so that the root file system can be checked at system startup. Once A/UX is running, the fsck command can check file systems as large as 4 GB.

Install Driver for the Apple Ethernet NB Twisted-Pair Card

If you are using this new interface card, install the driver on the volume named MacPartition. Installing the file on MacPartition assures that the server will use EtherTalk rather than switching to LocalTalk each time you restart the server.

CORRECTIONS TO MANUAL PAGES

=====

A few commands are incorrect as they appear onscreen in the manual pages. The corrections are as follows.

"newconfig" manual page

If you're adding support to your system for an Ethernet card, these are the modules you need to specify in the "newconfig" command:

ao - Built-in interface for Apple Ethernet.
as - Apple Ethernet NB Card (a half-length card).
ae6 - Apple EtherTalk NB Card (a full-length card).
ac - Apple Ethernet NB Twisted-Pair Card.

An error appears in the last paragraph of the Descriptions section: "bnet_dr" should be "bnet".

"NETADDRS" manual page

The value of interface_id is as follows:

ao0 - for built-in interface for Apple Ethernet (which is found in the
AWS 95)
ae0 through ae5 - for Apple EtherTalk NB Cards
as0 through as5 - for Apple Ethernet NB Cards
ac0 through ac5 - for Apple Ethernet NB Twisted Pair Cards

BUG FIXES

=====

A/UX Kernel

- AppleShare Pro servers will now appear correctly in the Chooser on client machines.
- AWS 95 no longer crashes if NFS clients have more than eight active supplementary groups. The server can recognize the first eight group IDs only.
- Heavy use of the UNIX file system no longer causes system or process deadlock/panics.

A/UX Macintosh Environment

- The Finder now maintains information properly on file systems containing more than 160,000 items.
- The File Manager allows you to change the case of a filename containing a slash character ('/').
- Text files that contain both CR's and LF's are no longer interpreted as UNIX binary files. They are now interpreted as DOS TEXT files.
- The Finder no longer terminates after rebuilding the desktop.

- Aliases to UNIX symbolic links resolve to the target file, not the sym-link.
- You can subscribe to a publisher that has a slash character ('/') in its name.

Retrospect

- The Macintosh environment no longer hangs because of loss of communication with a Retrospect Remote client.
- Scheduled backups now occur at the correct time.

Compatibility With Other Applications

- Think C now runs under A/UX.
- Adobe Photoshop no longer crashes with a disk error when it creates files bigger than the available free space on the volume.

UNIX Utilities

- The "catsearchd" utility is now set to "respawn" instead of "once" in "/etc/inittab."
- fsck
The "fsck" utility no longer ignores the -y option when the -p option is also specified.
By default, both the "A/UX Startup" application and the A/UX system startup script "/etc/bcheckrc" invoke "fsck" with both of these options.

For

Developers

- The Printer Access Protocol (PAP) server library is included in the software. The PAP server library is contained in the file "/usr/lib/libpaps.a". For information on the PAP Server Library, see the Tech Notes for the AWS 95 which are available through AppleLink.
- The "popen(3)" subroutine now supports 128 files, the maximum number of files supported by the standard I/O library routines. In the previous release this support was limited to 20 files.
- Float and double support were fixed in the RPC library routines (libc).
- When the current directory is a mount-point and a symbolic link is in the same directory, the "getwd(3)" routine returns the target file instead of the symbolic link as it did before.

Apple Telecom 2.x and Batch Faxing or Broadcast Faxing (8/95)

Revised: 8/14/95
Security: Everyone

Apple Telecom 2.x and Batch Faxing or Broadcast Faxing (8/95)

Article Created: 14 August 1995

TOPIC -----

What is batch faxing and broadcast faxing? Does the software included with the Apple GeoPort Telecom Adapter, Apple Telecom 2.x, support these features?

DISCUSSION -----

Neither broadcast faxing, nor batch faxing are supported by Apple Telecom 2.x software.

Below is a brief description of the broadcast faxing process:

In a typical fax, the common body is rasterized and compressed only once. The prepared material is then transmitted multiple times - one copy to each different recipient specified. The mechanism used to send a fax containing a document to multiple addresses is called a Distribution List. Broadcast transmissions are not broken into multiple calls.

Although the Apple Telecom 2.x software will allow multiple destinations to be selected in the Fax Sender dialog box, the document will be rasterized and compressed for each destination chosen. For example, if 20 destinations are chosen, the document being faxed will be rasterized and compressed 20 times.

Below is a brief description of the batch faxing process:

The process of batch faxing creates an envelope containing several different rasterized images or documents into one master file. For example, an envelope could be a report containing a cover letter, spreadsheet, chart, and graphics created within separate applications. The envelope containing these separate documents can then be faxed as one transmission.

A/UX: MacTCP Services Unsupported (8/95)

Revised: 8/14/95
Security: Everyone

A/UX: MacTCP Services Unsupported (8/95)

=====

Article Created: 14 August 1995

TOPIC -----

Do TCP/IP network services that run on MacTCP run in the Mac32 process of A/UX?

I've tried ftpd, mailshare, and Webstar, and none of them ever accept connections.

DISCUSSION -----

A/UX does support MacTCP calls in Mac32, which allows Mac OS programs to make outgoing connections. However, A/UX does not have any support for incoming sessions to connect to software that is listening as a server in MacTCP.

A/UX, being a form of UNIX, already has facilities to route incoming connections to UNIX processes (such as ftpd, telnetd, and sendmail), but does not provide any support for handing off connections to programs that use MacTCP.

LaserWriter Pro 810: UNIX Printing Outline (8/95)

Revised: 8/14/95
Security: Everyone

LaserWriter Pro 810: UNIX Printing Outline (8/95)

Article Created: 14 August 1995

TOPIC -----

I have an UNIX environment that is a collection of many vendors UNIX workstations. What systems and configurations are supported with the LaserWriter Pro 810.

DISCUSSION -----

The LaserWriter Pro 810 is supported for printing via TCP/IP using two methods:

lpr - Berkeley Line Printing

Using lpr is the fastest and simplest way for UNIX printing. LPR configuration is supported for any system that has lpr and a printcap file.

Systems known to support lpr include: A/UX, SunOS, and NeXTStep. This list is not comprehensive. If you do not know if your system supports lpr, consult your documentation or type "man lpr".

Follow the instructions in Network Installation and Configuration Manual:

Rev A Part 2, Section 4.1-2, (p 4-1 to 4-3)

Rev B Part 3, Section 4.1-2, (p 4-1 to 4-3)

For more details on lpr configuration, consult the article, "LaserWriter Pro 810: Postscript using lpr from Unix".

Systems emulating lpr (such as Solaris) are not officially supported for LPR, although there maybe TIL articles that describe their configuration. Many systems which are System V printing (lp) based retain support or emulation for lpr. Consult your system documentation for further assistance.

apprint - Apple Supplemental Printing Utilities

Apprint is supported for: AIX, AT&T Sys V386, NCR Sys V 386, SCO Unix, Solaris

2.x, SunOS 4.1.x, DEC ULTRIX.

Apple provides pre-compiled binaries for these systems in:

ftp.support.apple.com:/pub/apple_sw_updates/US/Unix/Printing Software for Unix

Follow the instructions in Network Installation and Configuration Manual:

Rev A, Part 2 "Software Installation Guide for UNIX-based Load Hosts"

Rev B, Part 3 "Software Installation Guide for UNIX-based Load Hosts"

The utility set, apprint, shipped as C code and an installation shell script. Although Apple does not support other UNIX systems and apprint, customers may have success compiling the apprint software on other systems.

System 7.5: Unable to Drag Items from Find File Window (8/95)

Revised: 8/14/95
Security: Everyone

System 7.5: Unable to Drag Items from Find File Window (8/95)

=====

Article Created: 14 August 1995

TOPIC -----

I am running System 7.5.1 on my Macintosh computer. I noticed I am no longer able to drag items from the top half of the Items Found window when I use Find File to search my hard drive. I used to be able to do this. What is wrong?

DISCUSSION -----

The Find File application uses AppleScript to execute some of its functions. It also requires an extension called the Finder Scripting extension to perform these functions.

You should make sure the Finder Scripting Extension is in the Extensions folder of your System Folder and that it has not been disabled in the Extensions Manager control panel.

If you cannot locate the Finder Scripting extension on your hard drive, you will need to reinstall it by reinstalling your system software.

MAE: Installing Chinese or Japanese Language Kits (8/95)

Revised: 8/14/95
Security: Everyone

MAE: Installing Chinese or Japanese Language Kits (8/95)

=====

Article Created: 14 August 1995

TOPIC -----

When trying to install either the Chinese, or Japanese Language Kit version 1.0 (version 1.1.1 is not compatible because it requires System 7.5), the following error appears:

"The installer cannot update the version of Performa system software on the disk '/'. Please read the file 'Read Me' on the disk 'Install 1' for more information."

What needs to be done?

DISCUSSION -----

To properly install the Chinese or Japanese Language Kits (CLK or JLK), remove the Launcher from the user's System Folder or use the Extension Manager to deselect the Launcher. After restarting, the installer should work properly.

MAE: Installing Microsoft Office (8/95)

Revised: 8/15/95
Security: Everyone

MAE: Installing Microsoft Office (8/95)

Article Created: 14 August 1995

TOPIC -----

What is the best way to install Microsoft (MS) Office 4.2.x onto my workstation to use with MAE?

DISCUSSION -----

There are several options to installing Microsoft Office on MAE.

If using the Microsoft CD

Mount the CD-ROM within MAE, launch the Microsoft Setup program, and proceed with the installation. When it asks for a destination directory for the install, locate a directory that has sufficient disk space and which the user has write-access to; then create a new folder called Microsoft Office to be the destination folder. Following the installation, if you choose to move the Microsoft Office package to a new location, do so keeping in mind the permissions of the folder.

Create a Net Install from another Macintosh

Using AppleShare with MAE 2.0, you can mount the folder and begin the install. Locate a directory with sufficient space and where the user has write-access, and create a new folder called Microsoft Office that will be the destination folder.

If you are running MAE 1.0

If you are running MAE 1.0, or you are not sure of the amount of disk space, and it is not possible to install with the CD or floppy; use Fetch on a Macintosh to copy the programs to your workstation.

NOTE: After you install Microsoft Office and if you installed it into your HOME

directory, be sure to remove the Microsoft Office control panel from the MAE System Folder. The Microsoft Office control panel is not compatible with MAE.

Plaintalk 1.4.1: ReadMe File (8/95)

Revised: 8/14/95
Security: Everyone

Plaintalk 1.4.1: ReadMe File (8/95)

=====

Article Created: 14 August 1995

TOPIC -----

This article contains the Read Me file included with the Plaintalk 1.4.1 software package.

DISCUSSION -----

PlainTalk is a collection of software that enables your Macintosh to speak written text and respond to spoken commands. PlainTalk 1.4.1 includes three components, each with its own installer: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition.

This document describes each of these three software packages, and discusses the differences between PlainTalk 1.4.1 and earlier versions of PlainTalk.

English Text-to-Speech

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. To install the English Text-to-Speech software, you need the following software and hardware:

- any Macintosh or Power Macintosh computer
- version 6.0.7 or later of system software
- at least 300 kilobytes (K) of RAM in addition to what the rest of your system software requires
- at least 5 megabytes (MB) of space available on your hard disk

For more information about the English Text-to-Speech software, see the Using English Text-to-Speech document or the About English Text-to-Speech document in the English Text-to-Speech folder.

Mexican Spanish Text-to-Speech

With the Mexican Spanish text-to-speech software installed, many Macintosh programs can read Spanish text out loud. To install the Mexican Spanish text-to-speech software, you need the following hardware and software:

- a Power Macintosh computer or a Macintosh computer with a 68020, 68030, or 68040 processor
- version 7.0 or later of system software
- at least 1.3 MB of RAM in addition to what the rest of your system software requires
- at least 2 MB of space available on your hard disk

For more information about the Mexican Spanish Text-to-Speech software, see the Using Mexican Spanish TTS document in the Mexican Spanish Text-to-Speech folder.

English Speech Recognition

With the English Speech Recognition package and the proper hardware, your computer can respond to spoken commands. The English Speech Recognition package includes the Speech Recognition system extension, the Speech control panel, and a utility called Speakable Items. With Speakable Items, whenever you say the name of an item inside the Speakable Items folder (which is inside the Apple Menu Items folder), the computer acts as if you double-clicked the item.

You can turn Speakable Items on and off using the Speech control panel. You can also use the Speech control panel to set several preferences for how Macintosh Speech Recognition programs listen and respond. For example, you can set the Listening options in the Speech control panel so that the recognizer only listens while you hold down a key of your choice. When you use this option recognition accuracy is improved and misfires (when the computer thinks you spoke a command but you didn't) are eliminated.

To install and use the English Speech Recognition software, including the Speakable Items software, you need the following hardware and software:

- a Power Macintosh computer
- system software version 7.5 or later
- a 16-bit microphone, such as the Apple PlainTalk Microphone or the microphone built into some Apple audiovisual displays.

For more information about the English Speech Recognition software and the Speakable Items utility, see the Using Speech Recognition document in the English Speech Recognition folder.

Differences between PlainTalk 1.4.1 and PlainTalk 1.4

PlainTalk 1.4.1 is a minor update to PlainTalk 1.4. It includes a few bug fixes, including the following:

- English Speech Recognition 1.4.1 works better than 1.4 worked with microphones

built into Apple AudioVision 14 displays.

- Version 1.4.1 of the Speech control panel (which is installed by version 1.4.1 of English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition) contains a fix to incompatibilities that version 1.4 of the Speech control panel had with HyperCard 2.3's popup menus when running on PowerMacintosh computers.
- Version 1.4 of the Speech control panel failed to run on some 68000 Macintosh computers (including Macintosh SE computers). Version 1.4.1 of the Speech control panel runs on all Macintosh computers with system software version 7.1 or later.

Differences between PlainTalk 1.4.1 and PlainTalk 1.3

Version 1.3 and earlier versions of the PlainTalk software had a single installer program that installed both text-to-speech and speech recognition. This version (1.4.1) contains three different installers to make it easier to install just the parts that are appropriate for your needs: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition.

You don't have to install them all. However, if you are going to install version 1.4.1 of English Speech Recognition or Mexican Spanish Text-to-Speech then you should first install version 1.4.1 of English Text-to-Speech, even if you already have an older version of English Text-to-Speech installed.

Deciding whether to upgrade to version 1.4.1

Version 1.4.1 of PlainTalk is a minor update to version 1.4. It fixes a few bugs discussed above in the section titled "Differences between version PlainTalk 1.4.1 and PlainTalk 1.4". If you are using version 1.4 and are experiencing any of those bugs, then you should update to version 1.4.1.

In general, version 1.4.1 offers a more robust and flexible set of features than version 1.3 or earlier versions. However, some people in special circumstances may do better with version 1.3.

- If you have a Macintosh AV computer that has a 68040 processor and you use PlainTalk 1.3's speech recognition capabilities, Apple recommends that you continue using version 1.3 of the PlainTalk software. Though the new text-to-speech software works with these computers, the new speech recognition software does not (because it runs on Power Macintosh computers only). It is not recommended that you mix versions, using the old recognition software with the new text-to-speech software. (Note: all the new software works with Power Macintosh AV computers.)
- If you make extensive use of PlainTalk 1.3's Speech Macros, the Speech Macro Editor, or the ability to speak menu commands, then you might want to continue using version 1.3. As part of the effort to make the software more robust, version 1.4.1 of English Speech Recognition supports Apple's standard AppleScript ScriptEditor instead of the Speech Macro Editor, and it does not support the ability to speak menu items. This is discussed more below.

What's new in English Text-to-Speech

English text-to-speech software version 1.4.1 is a minor update to version 1.4, as discussed above. English text-to-speech software version 1.4.1 is also very similar to version 1.3 and earlier versions. The main differences are:

- English Text-to-Speech 1.4.1 has its own installer.
- English Text-to-Speech 1.4.1 includes a Speech control panel that lets you select a system-wide default voice and rate, which is used by many text-to-speech programs, including SimpleText and the Speakable Items utility.

What's new in Mexican Spanish Text-to-Speech

Mexican Spanish text-to-speech software version 1.4.1 is a minor update to version 1.4, as discussed above. PlainTalk 1.4 was the first version of PlainTalk to include support for Mexican Spanish text-to-speech.

What's new in English Speech Recognition

English speech recognition software version 1.4.1 is a minor update to version 1.4, as discussed above. The most notable improvement from version 1.4 is that version 1.4.1 of English speech recognition works better than version 1.4 did with microphones built into Apple AudioVision 14 displays.

English Speech Recognition version 1.4.1 has some significant differences from the speech recognition software in version 1.3 and earlier versions of PlainTalk. Some features have been eliminated to simplify speech recognition and make it more robust and usable. Other options have been added to increase accuracy and eliminate misfires.

- Version 1.4.1 offers a new listening option in the Speech control panel, "Listen only while key(s) are pressed," that lets you leave Speakable Items on all the time without worrying about misfires. It also improves the accuracy of recognition.
- Version 1.4.1 works in a wider range of environments thanks to its greatly improved adaption to room acoustics.
- Version 1.4.1 does not include or support Speech Macros, the Speech Macro Editor, or Speech Rules. It still supports speaking dialog buttons and the Speakable Items folder. Any item you place inside the folder becomes speakable—saying the name of the item launches or opens the item. You can use the AppleScript ScriptEditor to create scripts that are launched by speaking a command: just save the scripts inside the Speakable Items folder. To see examples, look inside the Speakable Items folder.
- Version 1.4.1 runs on Power Macintosh computers only, and does not support Macintosh AV computers with 68040 processors. You can continue to use PlainTalk 1.3 on 68040 Macintosh AV computers.
- Version 1.4.1 does not include automatic support for recognizing the spoken names of menu commands. You can still manipulate scriptable programs, such as

the Finder, using AppleScript commands. To see examples, look inside the Speakable Items folder.

MAE: Macintosh Viruses Within MAE (8/95)

Revised: 8/14/95
Security: Everyone

MAE: Macintosh Viruses Within MAE (8/95)

=====

Article Created: 14 August 1995

TOPIC -----

Is there any concern for computer viruses within Macintosh Application Environment (MAE)? Will a Macintosh computer virus affect only my Macintosh files, or could it also harm the UNIX files as well? What application can be used to check for viruses?

DISCUSSION -----

Macintosh viruses can damage UNIX files that the user has permissions to. Normally, a Macintosh virus attacks the resource fork which does not exist for UNIX files. However, there may be the possibility of damage if the virus attacks the data file.

MAE includes Disinfectant 2.5, located in ./apple/tools/shareware. Using the selected scan option (hold down the Option key) in Disinfectant should scan for any virus affected files.

Using products like SAM Intercept may work, however, SAM Intercept has not been fully tested. Also Norton Utilities has not been tested, because of certain hardware and disk assumptions that will not match with UNIX workstations.

GeoPort 2.2 Telecom Adapter ReadMe (5/96)

Revised: 5/27/96
Security: Everyone

GeoPort 2.2 Telecom Adapter ReadMe (5/96)

=====
Article Created: 14 August 1995
Article Reviewed/Updated: 26 May 1996

TOPIC -----

This article is the GeoPort Telecom Adapter 2.2 Read Me file.

DISCUSSION -----

Software included in the GeoPort Telecom Adapter Kit
=====

Apple Telecom Software 2.2

This includes all software necessary to use the GeoPort Telecom Adapter with the following Macintosh systems:

- Centris 660AV, Quadra 660AV and Quadra 840AV.
- Power Macintosh 6100 series, 7100 series, 7200 series, 7500/100, 8100 series, 8500/120, and 9500 series.

The Apple Telecom User's Guide contains complete information about installing and using this software. An electronic Apple Telecom Upgrade Manual is included in the Telecom Documents folder so that you can learn about the new features if you upgraded electronically and don't have the Apple Telecom User's Guide. Disks 1 and 2 can also be used to install Apple Telecom 2.x software on Macintosh systems equipped with an Express Modem card.

NOTE: For Power Macintosh 7200 series, 7500/100, 8500/120, and 9500 series, version 2.1 or higher of Apple Telecom Software is required. If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any devices attached to the printer port (except serial printers, which can remain attached).

IMPORTANT: If you select "Sleep" from the Special Menu available on some Power Macintosh models while there is an active GeoPort connection, the GeoPort

Telecom Adapter will automatically disconnect the call without warning. When a Power Macintosh 7200 series model is in the low-power mode, the GeoPort Telecom Adapter will wake up the machine if the telephone rings and the machine is awaiting an incoming call. The monitor will remain in the low-power mode. While a connection is open via a GeoPort Telecom Adapter, your Power Macintosh will not enter the low-power mode, but the monitor will dim the screen.

MegaPhone (for United States, Canada, and Japan only)

This is a screen-based telephone application that delivers full support of the telephony capabilities of the Apple Telecom 2.x software, including support for dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information, and voice-mail functions.

The GeoPort Telecom Adapter Kit also includes a free 30-day trial of call logging, MegaDial dialing manager, intelligent synchronization with directory information (saving telephone numbers to a PowerTalk catalog, for example), and other extended capabilities.

See also: the MegaPhone electronic manual included on Disk 3 (Telecom Applications).

NOTE: MegaPhone is not installed by the Apple Telecom Installer program. You must install it separately.

SITcomm SE/GTA (for United States and Canada only)

This is a terminal emulator application. With SITcomm SE/GTA (Special Edition for GeoPort Telecom Adapter), your Macintosh can communicate with a variety of other computers, linked by serial cables or by telephone lines.

With SITcomm you can exchange information with

- A colleague who is using another computer with similar communications software.
- Text-based information and electronic mail services, such as CompuServe or MCI Mail.
- Your company or school's remote minicomputer or mainframe.

See also: the SITcomm SE electronic manual included on Disk 4 (Telecom Applications).

NOTE: SITcomm is not installed by the Apple Telecom Installer program. You must install it separately.

NOTE: SITcomm (Disk 4) is not included with free upgrades. You can order the full upgrade, including SITcomm SE and the Apple Telecom User's Guide manual, by calling the Apple Order Center. Ask for the Apple Telecom software version 2.x upgrade for use with your GeoPort Telecom Adapter.

Upgrading from previous releases of GeoPort Telecom Adapter software

=====

If you are installing this version of the software over an older version, you

should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

NOTE: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

When you have installed over an older version, the folders "Modem Documents" and "Express Fax" and the file "GeoPort ReadMe" may still be left on your hard disk from the earlier version. These are not necessary for using the newer version; you may delete them.

Connection (CCL) scripts for Apple Remote Access

Use the following connection scripts with Apple Remote Access:

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)
ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide. Apple Remote Access 1.0 does not support Power Macintosh computers. You can order an upgrade for Apple Remote Access by calling the Apple Order Center.

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter), you should select it in the Apple Remote Access Setup control panel.

NOTE: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Remote Access Dial Back

If your Remote Access server uses a "Dial Back" feature, the server's return call back to your machine may be inadvertently directed to an open telephone application. To avoid this situation, either close these applications or open the Express Modem control panel and choose "Data" as the default call type when you expect an incoming call from another computer.

Using Fax Sender GX with QuickDraw GX 1.1

=====

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex greyscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

NOTE: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

NOTE: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

NOTE: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature

only works with PostScript® printers.

Troubleshooting

=====

Connecting to Online Services That Do Not Support Data Compression or Error Correction.

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the GeoPort Telecom Adapter to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication Settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying Incoming Calls

When answering your phone line, the GeoPort Telecom Adapter will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application (such as MegaPhone), we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

If you have problems receiving calls from data modems (when using the Apple Remote Access dial back feature, for example), try decreasing the number of rings to Auto-answer in the Express Modem control panel (if permitted in your country). Some calling modems may time out and disconnect before your modem answers if the number of rings is too high.

Removing Fax Storage Folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Using a Centris 660av or Quadra 660av/840av

If you are using a Centris 660av or Quadra 660av/840av and experience errors when attempting to establish a connection, you may need to change the audio settings on your computer. The default setting of 24.000 kHz is compatible with the GeoPort Telecom Adapter. To change this setting, open the sound control panel, choose "Sound Out" and select the "24.000 kHz" sampling rate.

Resetting a Blacklisting Error Message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

Clicking sound from GeoPort Telecom Adapter

If your machine freezes, the GeoPort Telecom Adapter can lose its connection with your machine and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your machine.

Port Selection

The interface for selecting the correct communications port has been simplified since GeoPort Telecom Adapter software versions 1.0.2 (Power Macintosh) and 1.2.2 (660av/840av). The "Use internal modem instead of modem port" checkbox has been removed from the Express Modem Control Panel. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. If so, all serial communications are first processed by the Express Modem software and transmitted through the GeoPort Telecom Adapter. If not, serial communication passes through the modem port directly.

GeoPort has been removed from the list of ports. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. Select Modem Port whenever you wish to communicate through the GeoPort Telecom Adapter.

What Goes Where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- GeoPort Telecom Adapter ReadMe
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Gateway manual for users who upgrade electronically)
- About Fax Sender GX (Fax Sender GX manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- GeoPort Telecom ARA 1.x/CNG (optional, transmits data calling tone, 660/840AV only)
- GeoPort Telecom ARA 2.x/CNG (optional, transmits data calling tone)
- Modem AT Command Set

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- GeoPort for Power Macintosh (Power Macintosh only)
- GeoPort Extension (660/840AV only)
- GeoPort Serial Driver
- GeoPort Telecom Adapter
- GeoPort Telephone Tool
- GeoPort Telecom ARA 1.x (Apple Remote Access 1.0 CCL, 660/840AV only)
- GeoPort Telecom ARA 2.x (Apple Remote Access 2.0 CCL)
- Serial Extension
- Shared Library Manager
- Telephone Manager Extension

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)

- Electronic Telephone (sound resource)

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

CLW 12/600 PS & LW 16/600 PS: Window 95/NT Drivers (1/97)

Revised: 1/24/97
Security: Everyone

CLW 12/600 PS & LW 16/600 PS: Window 95/NT Drivers (1/97)

Article Created: 15 August 1995
Article Reviewed/Updated: 24 January 1997

TOPIC -----

What drivers for the Color LaserWriter 12/600 PS and the LaserWriter 16/600 PS printers are available to support Windows 95 and Windows NT?

DISCUSSION -----

As of January, 1997 there are two separate disk sets now available for the Color LaserWriter12/600 PS and LaserWriter 16/600 PS printers. These disk sets can be found on Apple Computer's Software Update online services. Look for these files (the file names may not be exactly as shown below, they may differ slightly depending on which online service you use):

LW Win3.1 3.0.8
LW Win3.1 3.0.8-1of2.sea
LW Win3.1 3.0.8-2of2.sea
LW31_308.TXT
LW31_308.ZIP

LW Win95 4.2
LW Win95 4.2-1of3.sea
LW Win95 4.2-2of3.sea
LW Win95 4.2-3of3.sea
LW95_42.TXT
LW95_42.ZIP

One disk set is for Windows 3.1x and the other for Windows 95. If you need to install this printer software on Windows NT 3.5 or later, then use the Windows 3.1x disk set.

Microsoft wrote the AppleTalk stack for Windows NT, and they support network printing to these printers (not Apple). If you are using Windows NT for network printing, you should be aware there are problems with Windows NT's AppleTalk

stack prior to version 3.5. Apple Computer, Inc. does support and maintain parallel printing on Windows NT.

The installation procedure for these printers on Windows NT and Windows 95 can be found in the read me files on the installation disk set.

Note:

The instructions for installing this software in Windows NT 4.0 are different than the instructions for installing this software in Windows NT 3.5x. Please consult the read me files for correct installation instructions.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

24 Jan 1997 - Updated with current information.

14 Oct 1996 - Added NT 4.0 information.

01 Apr 1996 - Changed disk part names.

Color LW 12/600 PS: Photoconductor LED Turns On Early (4/96)

Revised: 4/2/96
Security: Everyone

Color LW 12/600 PS: Photoconductor LED Turns On Early (4/96)

Article Created: 15 August 1995
Article Reviewed/Updated: 1 April 1996

TOPIC -----

The photoconductor LED (error light) on my Color LaserWriter 12/600 PS turned on after printing only 3,000 pages even though the print quality looks fine. Do I need to replace the photoconductor as directed by the user's manual?

DISCUSSION -----

Apple recommends replacing the photoconductor (OPC -- Organic Photoconductor) only when there is a noticeable degradation of print quality. To assist in monitoring the print quality keep the startup and demonstration pages that print when a new photoconductor is installed in the printer. These pages represent the print quality that can be expected with a new photoconductor. Periodically printing the startup and demonstration pages allows the print quality to be compared with the pages generated when the photoconductor was new. If the print quality has degraded to an unacceptable level (ie. overexposed, lack of contrast, scratches, or spots) then the photoconductor should be replaced. Under normal circumstances the life of the photoconductor can be in excess of 6,500 pages depending on the type of printing being done.

The photoconductor LED on the status panel is activated by an internal counter after 3,000 color pages have been printed. The Color LaserWriter controller uses a photosensitive drum thickness circuit to determine when a new photoconductor has been installed so that the photoconductor LED can be turned off for another 3,000 pages. The thickness detection is performed every 100 printed pages, at power on, and whenever the front door is opened and closed. Removing and reinstalling the original photoconductor will not reset the LED because the printer engine controller compares the current drum thickness data with the drum thickness data stored on the DC controller to determine whether a new photoconductor has been installed.

MAE 2.0: The license_binder Program (8/95)

Revised: 8/15/95
Security: Everyone

MAE 2.0: The license_binder Program (8/95)

Article Created: 15 August 1995

TOPIC -----

This article describes license_binder, a program used with MAE 2.0.

DISCUSSION -----

The purpose of license_binder is to create a license file to help Administrators keep track of MAE licenses. The location of license_binder is, ./<apple_dir>/bin, where <apple_dir> is the location the user installed MAE. After installing MAE, follow the steps below to properly set up MAE licensing.

Step 1

Execute ./<apple_dir>/bin/license_binder

Step 2

Input the serial number found on the inside cover of the MAE package or on the CD cover.

Step 3

Depending on the license, input the "user" or "display" that are licensed to use MAE.

If you license the user, then that user can logon to any display and use MAE. If you license the display (by host name or IP Address), any user that resides on that display can use MAE.

Step 4

After using all licenses per serial number, the license_binder will exit. A directory called ./<apple_dir>/license_dir will now have the license file with the user and/or display information.

Central Administration of Licenses

System Administrators can choose where the license file resides. This lets large installations have a centrally maintained license_dir directory that is shared among all MAE users. When MAE is installed, by default, the license_binder data files are stored in ./<apple dir>/license_dir. To place the license_binder data files in a central location (whether the central location is local to the users or out on the network), follow these steps:

Step 1

Install MAE in the machine that is to contain the centrally located license_binder data files, and execute the license_binder program. Export the ./license_dir directory via NFS. Be sure that all users have access to the location of the exported license_dir.

Step 2

On systems that will have MAE running, create a directory called license_dir in the <apple dir> and then mount via NFS the exported license_dir to the license_dir mount point.

If the license files are to be located elsewhere in the file system, set the MAE_LICENSES environment variable to the location at which the data files are to be placed.

NOTE: Setting the MAE_LICENSES environment variable to a pathname causes MAE to create a new directory if needed, and places the data files in that directory if license_binder is run after setting MAE_LICENSES. Be sure that all users set and export MAE_LICENSES on their workstations to the appropriate location.

DOS Compatibility Card: Less RAM Than Set In PC Setup (10/95)

Revised: 10/9/95
Security: Everyone

DOS Compatibility Card: Less RAM Than Set In PC Setup (10/95)

Article Created: 15 August 1995
Article Reviewed/Updated: 9 October 1995

TOPIC -----

I have 40 MB of RAM in my Macintosh, and I have selected 16 MB for my DOS Compatibility Card in the PC Setup control panel. However, my DOS Compatibility Card will only access 8 MB of RAM. I thought I could access half of the RAM. Why does this happen?

DISCUSSION -----

Yes, it is true that you can allocate half of the total physical RAM to the DOS Compatibility Card using shared memory. However, the only choices are the ones in the menu of the PC Setup control which are: 2, 4, 8, 16, 32. There are choices for 1 and 64 but none of these are ever available, even with a full load of RAM. Since you have 40 MB RAM, the closest number to 20 (half of 40) is 16. Therefore, you can, at most, share 16 MB RAM with the DOS Compatibility Card.

You cannot share virtual memory (VM) to the DOS Compatibility Card. If the system only has 16 MB RAM and you set VM to 32 MB, you can still only share a maximum of 8 MB RAM.

There are two situations that must be kept in mind when sharing RAM between a Macintosh and DOS Compatibility Card. Both can affect the DOS Compatibility Card, they are as follows:

- When changing the RAM allocation in the PC Setup control panel, you must restart the Macintosh before the RAM change will take effect.
- During startup, if you have several extensions or control panels load before PC Setup, a reduced amount of RAM will be available for the DOS Compatibility Card. For example, having a large RAM Disk mount at startup may allocate enough memory before PC Setup loads forcing it to reduce its memory allocation below the control panel setting. If this happens, you must evaluate whether all of your extensions and/or control panels are necessary, and turn those off which

are not.

Express Modem Read Me: Apple Telecom 2.3.2 (11/96)

Revised: 11/7/96
Security: Everyone

Express Modem Read Me: Apple Telecom 2.3.2 (11/96)

=====
Article Created: 16 August 1995
Article Reviewed/Updated: 7 November 1996

TOPIC -----

This article is the Express Modem Read Me file that comes with the Apple Telecom 2.3.2 software posted online.

DISCUSSION -----

Express Modem Read Me

Apple Telecom Software
=====

This software runs on the following machines with their respective Express Modem internal modems:

- PowerBook 160, 165, 165c, 180, 180c, using an internal Apple PowerBook 14.4 Modem Card.
- PowerBook Duo 210, 230, 250, 270c, 280, 280c, 2300c, using an internal Apple PowerBook Duo 14.4 Modem.
- PowerBook 520, 520c, 540, 540c (with or without PowerPC processor upgrade), using an internal Apple PowerBook Express Modem II Card.*

* Note: The Express Modem II is only offered internationally.
It is not available in the U.S.A. The original Read Me file
did not note that this modem is only available outside the U.S.A.

- LC 575, Macintosh Quadra, LC, Performa 630, using an internal Macintosh Express Fax/Modem (for the United States and Japan only).

Compatibility with At Ease

..TIL18388-Express_Modem_Read_Me-Apple_Telecom_2-3-2_11-96.pdf

Apple Telecom Software v2.3.1 is now compatible with At Ease. You will be able to access the Express Modem control panel when At Ease is the user interface.

Installing over an older version of the software

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

Note: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

Preferred CCL scripts for Apple Remote Access

ARA 1.0: Express Modem ARA 1.x (in Extensions folder in System Folder)
ARA 2.0: Express Modem ARA 2.x (in Extensions folder in System Folder)

Note: These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide.

Two additional, optional connection (CCL) files, named Express Modem ARA 1.x/CNG and Express Modem ARA 2.x/CNG, are installed as well. When you use them, the Express Modem transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as a GeoPort Telecom Adapter), you should select one of these connection files in the Apple Remote Access Setup control panel.

Note: The Express Modem ARA 1.x/CNG and Express Modem ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Fax Sender GX with QuickDraw GX 1.1

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex greyscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

Note: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality

from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

Note: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

Auto-answer setting

If Fax Terminal is set to Auto-answer, the Manual Receive is disabled.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript® printers.

Troubleshooting

=====

Connecting to online services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the Express Modem to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying incoming calls

When answering your phone line, the Express Modem will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application, we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

Removing fax storage folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Resetting a blacklisting error message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the

BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

What goes where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- Express Modem Read Me
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Gateway manual for users who upgrade electronically)
- About Fax Sender GX (Fax Sender GX manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- Modem AT Command Set
- Express Modem ARA 1.x/CNG (optional, transmits data calling tone)
- Express Modem ARA 2.x/CNG (optional, transmits data calling tone)

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- Express Modem ARA 1.x (Apple Remote Access 1.0 CCL)
- Express Modem ARA 2.x (Apple Remote Access 2.0 CCL)

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)

- Electronic Telephone (sound resource)

Open Transport: Not Compatible With AppleTalk Phase 1 (8/95)

=====

Article Created: 16 August 1995

TOPIC -----

Is Open Transport compatible with AppleTalk Phase 1 networks?

DISCUSSION -----

No. Open Transport will not work with AppleTalk Phase 1 networks, or with the AppleTalk Phase 2 Upgrade Utility. Customers using AppleTalk Phase 1 will have to upgrade to AppleTalk Phase 2.

Color LW 12/600 PS: Don't Bypass PageMaker Driver (8/95)

=====

Article Created: 08 August 1995
Article Reviewed/Updated: 22 August 1995

TOPIC -----

When I bypass the PageMaker print driver, using Option-Print, PageMaker does not seem to send the correct black color information to the color LaserWriter 12/600 PS printer. However, I get the correct black color information using the PageMaker print driver; Print from the File menu.

Because the PageMaker driver often causes problems, I sometimes try printing with Apple's LaserWriter driver using Option-Print. Is there a way to get the correct colors from PageMaker using the Apple LaserWriter printer driver?

DISCUSSION -----

You don't get dark blacks from PageMaker using the Option-Print because of the way Adobe sends the information to the Apple Printer Driver. Adobe technical support is aware of the problem, but state that using the OPT-PRINT is NOT a supported solution. If you are encountering problems printing using PageMaker's print command, you should contact Adobe technical support. Instead of using Opt-Print, Adobe Technical Support will assist you in determining your printing problem.

Article Change History:
22 Aug 1995 - Clarified the problem and solution.

Open Transport: TCP/IP Control Panel Simplified (7/96)

Revised: 7/3/96
Security: Everyone

Open Transport: TCP/IP Control Panel Simplified (7/96)

=====

Article Created: 16 August 1995
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article provides a simplified explanation of the elements of the Open Transport TCP/IP control panel settings.

DISCUSSION -----

Question: What does the TCP/IP control panel let me do?

Answer: The Transmission Control Program/Internet Protocol (TCP/IP) control panel lets your Macintosh speak the protocol or "language" of the Internet. The Mac OS uses AppleTalk, the protocol of Apple Macintosh computers and LaserWriter printers. But the Internet uses the TCP/IP protocol suite, which is the "language" of UNIX systems.

Question: What is an IP address?

Answer: Each machine or "host" connected to the Internet must have a unique IP address in order to communicate with other hosts. It is like a telephone number. An IP address is a 32-bit number, usually expressed in dotted decimals, for example: 128.1.1.24

Question: What is the significance of the dotted decimals in an IP address?

Answer: Similar to the way a telephone number is divided into area code, exchange, and individual phone number, an IP address is also subdivided into octets (each "octet" is 8 bits, 8 bits X 4 octets = 32 bits) that designate network, subnetwork, and node. The network is like the area code; it describes a certain piece of the Internet where your Macintosh is connected. A subnetwork is similar to an exchange; it further breaks down the network into smaller chunks, and each subnetwork can have its own range of nodes, like the individual phone numbers on that exchange.

Note that not all networks use subnetting to further divide their network.

Question: What is the subnet mask?

Answer: This mask is what is used to indicate which bits of your 32-bit IP address designate the "network", and which bits designate the "node". Remember that the dotted decimal format is just an easy way of expressing the 32-bit address. If you were to write out the example address, 128.1.1.24, in binary numbers, it would look like this:

10000000.00000001.00000001.00011000

The subnet mask is also a 32-bit number; when superimposed over the IP address, every bit that matched a "1" would be part of the "network", and every bit that matched a "0" would be part of the node. For example, a subnet mask of 255.255.0.0 would look like this:

11111111.11111111.00000000.00000000

This would indicate that the first two octets of the IP address (128.1) indicated the network. The last two octets (1.24) are the node on the network 128.1.0.0.

There are three main classes of IP addresses and each class has a default subnet mask. The class is determined by the first few bits of the 32-bit IP address, as indicated below. For example, because the first bit of a class A address must be 0, when expressed in decimal numbers, the first octet will be 127 (01111111) or lower, because 128 in binary numbers starts with a "1": 10000000.

Begin_Table

Class	Identified by 1st Octet	Default Subnet Mask
A	First bit = 0 (0-127)	255.0.0.0
B	First two bits =10 (128-191)	255.255.0.0
C	First three bits = 110 (192-223)	255.255.255.0

End_Table

Each organization can use the bits for their nodes to define subnets at their routers. For example, a class A address has the first 8 bits defining the network. An organization might decide to take the two middle octets – 16 bits – to define subnets, and then the final 8 bits would define a node on the subnet on the network.

This information is used by routers to determine how to route the IP packets to the network you are attached to.

Question: What are the different ways I can connect to the Internet?

Answer: If you are connected to a LAN that has access to the Internet, you simply use that LAN connection for your Internet communications. If you are on an Ethernet or Token Ring LAN, you can select either Ethernet or Token Ring,

respectively, in the connect via field of the TCP/IP control panel. These types of networks support different protocols, so you can direct AppleTalk and TCP/IP, as well as other protocols such as IPX, over these networks at the same time.

If you are on a LocalTalk LAN, or connecting via Apple Remote Access, then you are limited to using AppleTalk protocols. However, TCP/IP packets can be encapsulated in AppleTalk packets for transmission over these connections. This is referred to as "MacIP". To use MacIP, you need a MacIP server, which sits on both an AppleTalk and a TCP/IP network, and acts as a middleman between you and the Internet. You send your AppleTalk encapsulated IP packet to the MacIP server using AppleTalk protocols; it strips off the AppleTalk encapsulation, and places the IP packet out on the Internet. When packets are destined to you from the Internet, it does the reverse.

If you are not on a LAN that has connections to the Internet, then you can gain access through Internet Service Providers (ISPs). SLIP (Serial Line IP) or PPP (Point-to-Point Protocol) connections give you access to the Internet, using your modem and phone lines.

Question: Where do I get an IP address and a subnet mask?

Answer: This information must come from the person who is in charge of the network you are physically connecting to. If you are connected to a LAN that has a connection to the Internet, talk to your network administrator. If you are using a SLIP or PPP connection, talk to your Internet Service Provider (ISP).

The network administrator or ISP will also tell you the manner in which you can obtain your IP address (whether you are assigned one that you have to enter manually, or whether you get one from a server), in addition to the other information you need to configure TCP/IP.

Question: What are BOOTP, RARP, and DHCP?

Answer: These terms stand for Bootstrap Protocol, Reverse Address Resolution Protocol, and Dynamic Host Configuration Protocol. These protocols let a computer obtain its IP address (and sometimes other information, such as subnet mask) from a server. In the simplest terms, when a machine needs an IP address (on a Macintosh, this might be when you first attempt to launch an application that uses TCP/IP protocols), it asks the server for an IP address. Depending on the type of server, you are either assigned an address that has been set aside especially for your machine, or you are given one from a pool of available addresses.

These protocols are used to make administration of large networks easier.

Question: What is a domain name and a domain name server?

Answer: Because it is difficult for humans to remember a series of somewhat meaningless numbers, we assign names to them. Apple Computer's domain is apple.com; it also has lots of subdomains, such as corp.apple.com, and austin.apple.com. The subdomains simply define smaller areas within the apple

domain. A machine called max on the subdomain info.apple.com would have a fully qualified domain name of max.info.apple.com, and its IP address might be 204.16.92.4. A domain name server in each domain is in charge of keeping a table of the machines in its network and their IP addresses. If you want to talk to max you can address it with either its IP Address or with its name. If you use its name, you need to resolve the name by asking a domain name server for that machine's IP address. This is all done behind the scenes.

Question: How does domain name resolution work?

Answer: Your network administrator or ISP should give you the IP addresses of one or more domain name servers. You list these in the field called Name server addr: in the TCP/IP control panel.

Here is an example which shows how a name is resolved. Assume that Sue's TCP/IP control panel is configured with a domain name of drc.corp.apple.com. Her admin domain is apple.com. Also in her search domain names, she has entered info.apple.com.

She has listed three different IP addresses in the Name server addr field.

When Sue attempts to connect to a machine using its domain name, max.austin.apple.com., her Macintosh computer contacts the first domain name server in the list to see if it can resolve the name (if it can give her the machine's actual IP address). If it cannot do so, the other name servers are tried, in the order Sue has listed them.

Note that max.info.apple.com. is a "fully-qualified" domain name; the period at the end indicates this. Using simply max is possible, but because max is not fully qualified (and this is clear because it does not contain a single "."), a domain name must be appended to it before a domain name server can resolve it.

First, Sue's own domain is tried: max.drc.corp.apple.com. If a search on this name fails, other attempts to resolve the name are made by dropping off one subdomain at a time, until she reaches her admin domain. For example, the searches are conducted on the following names, in the order given:

max.drc.corp.apple.com
max.corp.apple.com
max.apple.com

If the name is not found, it attempts to resolve the name using the domain name in the Search domain names field, in this case:

max.info.apple.com

Question: What is the host file?

Answer: A host file is a text file that resides at the root level of your System Folder, and contains a table of domain names and IP addresses. This table can also be used for domain name resolution, but domain name servers are more

commonly used, because they are easier to manage and maintain. If your network administrator gives you a host file to use, simply place it within your System Folder.

This article was published in the "Information Alley":
Volume II, Issue 12, Page 7

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Power Macintosh 5300/100 LC:Technical Specifications (3/96)

Revised: 3/5/96
Security: Everyone

Power Macintosh 5300/100 LC:Technical Specifications (3/96)

=====

Article Created: 5 September 1995
Article Reviewed/Updated: 5 March 1996

TOPIC -----

This article contains a list of technical specifications for the Power Macintosh 5300/100 LC computer.

NOTE: This computer is only available through educational channels.

DISCUSSION -----

Microprocessor

-
- 100-MHz PowerPC 603e
 - 256K Level 2 Cache

Memory

-
- 16 MB of RAM, expandable to 64 MB (Two 72-pin, 70ns DRAM SIMM slots, no RAM soldered on-board). Usually ships with one 16 MB SIMM in one slot.

Storage

-
- Built-in removable Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
 - Internal 1.2 GB IDE hard disk drive

Expansion Slots

-
- One 114-pin LC 030 PDS slot
 - One 112-pin Communications slot for modem or Ethernet card supporting these Apple Ethernet cards:
 - Apple Ethernet CS Twisted Pair Card
 - Apple Ethernet CS Thin Coax Card

- Apple Ethernet CS AAUI Card
- One 60-pin video input slot for realtime video display

Ports

- One Video output port
- One Mono sound input port
- One Stereo sound output port (16-bit)
- One Apple Desktop Bus (ADB) port
- Two serial (RS-422) ports (do not support GeoPort)
- One SCSI port for connecting as many as six external devices (including CD-ROM)

Video

- Video Modes: 640x480 @ 16-bit, 800x600 @ 8-bit (and 832x624 @ 8-bit with no video-in support)
- Video mirror output for second monitor
- TV Tuner
- One Video capture card

Sound

- 16-bit on-board stereo sound output and mono sound in (16-bit CD and video)

Article Change History:

- 05 Mar 1996 - Expanded info about expansion slots.
- 15 Jan 1996 - Corrected minor typo.
- 29 Nov 1995 - Corrected video-out information.

Power Macintosh 7200: Maximum Color Depths (1/96)

Revised: 1/10/96
Security: Everyone

Power Macintosh 7200: Maximum Color Depths (1/96)

=====

Article Created: 16 August 1995
Article Reviewed/Updated: 10 January 1996

TOPIC -----

The Power Macintosh 7200 series computers come with 1 MB of VRAM on the logic board, expandable to 2 MB or 4 MB. The 7200 has 3 VRAM DIMM slots. The article below describes the number of colors available based on the amount of VRAM installed.

DISCUSSION -----

The Power Macintosh 7200 series computers comes with 1 MB of VRAM on the main logic board. You can increase VRAM to 2 MB by installing one 1 MB DIMM in the first VRAM slot, or to 4 MB by filling all three VRAM slots with 1 MB DIMMS. A VRAM upgrade can be accomplished with third party 1 MB VRAM DIMMS.

The Power Macintosh 7200 has a 64-bit data path to VRAM (with 2 MB or 4 MB of VRAM). It will support display resolutions of up to 1280x1024 pixels and 24-bit color (millions of colors) of up to 1024x768 pixel resolution.

IMPORTANT:

The VRAM DIMMs must be 112-pin fast-paged mode, with 70ns RAM access time or faster. Do not use 256K VRAM SIMMs.

The following table defines the maximum color depths available for a given resolution and memory size. Lower color depths are supported down to 8 bit or 256 colors. This is the same information that is reproduced in the technical specification guide that comes with the computer.

NOTE:

The maximum visible number of colors is millions. In the past, Apple has also labeled millions as 24 bit color. On AV and Power Macintosh computers, 24 bit or 32 bit can be used interchangeably to mean support for millions of colors. In some literature, you may see 32 bit shown in place of 24 bit or millions. Think of this as 24 plus 8: 24 bit for displaying millions of colors plus 8 bit for

special uses, such as alpha channel support (transparency, masking, opaque and tranlucient information) and chroma key support.

Apple Multiple Scan 14 Display: Macintosh Video Support (6/96)

Article Created: 17 August 1995
Article Reviewed/Updated: 20 June 1996

TOPIC -----

This article gives the video modes supported on each Macintosh computer with the Apple Multiple Scan 14 Display, and which computers require display adapters. This display supports resolutions of 640x480 to 800x600.

DISCUSSION -----

Begin_Table

Apple Multiple Scan 14 * Macintosh Video Support			
Product Family	Model	Resolution Supported	
		640x480	800x600 (1)
Power Macintosh	6100, 7100, 7200, 7500, 8100, 8500, 9500	Yes	No
Quadra/Centris	605, 610, 630, 650, 700, 800, 900, 950	Yes	Yes
	660AV, 840AV	Yes	Yes
Macintosh II	IIci	Yes (2)	Yes (2)
	IIsi	Yes (3)	Yes (3)
	IIvi, IIvx	Yes (4)	Yes (2)
	II, IIx, IIcx, IIfx	Yes (2)	Yes (2)

Macintosh LC	LC 475, LC 630	Yes	Yes
	LC 520, LC 575	No	No
	LC, LC II	Yes (4)	No
	LC III	Yes	No
	LC 5200	Yes (5)	Yes (5)
Macintosh TV	Macintosh TV	No	No
Performa	400, 405, 410, 430	Yes (4)	No
	450, 460, 466, 467	Yes	No
	475, 476	Yes	Yes
	550, 560, 575, 577, 578,	No	No
	600, 600CD	Yes (4)	Yes (2)
	630 series	Yes	Yes
	5200	No	No
	6100 series	Yes	No
	6200 series	Yes	No
PowerBook	160, 165, 165c, 180, 180c	Yes	No
	100, 140, 145, 170	No	No
	190, 190cs	No	No
	190, 190cs with video out upgrade kit installed	Yes	Yes
	520, 520c, 540, 540c	Yes	Yes
	5300, 5300cs, 5300c, 5300ce	Yes	Yes
PowerBook Duo	210, 230, 250, 270c, 2300c	No	No
	MiniDock, Duo Dock, Duo Dock II	Yes	Yes (2)
Apple Display Cards	24AC	Yes	Yes
	8•24, 8•24 GC 4•8	Yes	No

	-----	-----	-----
	Mac II video card	No	No
	2-Page MoN video card		
	Mac II MoN video card		
	Mac II Portrait video card		
	Mac II HiRes video card		
	Mac II Ext HiRes video card		
-----	-----	-----	-----

Notes:

- (1) - Non-Macintosh "hidden" resolutions, such as 800x600 and 640x400 are not available with System 7.5.1 and higher
- (2) - Requires compatible display card or display adapter.
- (3) - Requires compatible display card and Macintosh IIsi NuBus Adapter card or display adapter.
- (4) - Requires a display adapter.
- (5) - Requires the Apple External Video Connector (p/n M4099LL/A). Only supports video mirroring. When using video mirroring, the image on the second monitor is the same as that on the built-in monitor.

End_Table

Display Adapters

=====

The adapters, available through Apple resellers and the third-party companies, contain a sense code that tricks the Macintosh into believing that the display is fixed frequency display. Without the adapter, the display will be fixed at a 640x480 resolution. The display adapter also provides the proper sync signal from some computers built-in video to the Multiple Scan 14 Display.

Display adapters are available from several third-pary companies such as Enhanced Cable Technology, Griffin Technology, and MacAdapt.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

- 18 Jun 1996 - Added more display adapter information.
31 May 1996 - Added note about 800x600 availability on System 7.5.1 and higher.
09 Feb 1996 - Added additional display adapter information.

Apple Personal Diagnostics: Which Models Supported (1/97)

Revised: 1/28/97
Security: Everyone

Apple Personal Diagnostics: Which Models Supported (1/97)

=====
Article Created: 16 August 1995
Article Reviewed/Updated: 28 January 1997

TOPIC -----

Which Macintosh models do the various versions of Apple Personal Diagnostics (APD) support?

DISCUSSION -----

Version 1.0 of APD did not support Power Macintosh computers. Version 1.1.1 added support for some Power Macintosh models. Version 1.1.3 is the most current version of APD.

Apple has not announced plans to update Apple Personal Diagnostics to support future computer releases. Below is a comprehensive list of Macintosh computers supported by APD 1.1.3, spanning over 140 different models from the Macintosh Plus up through the Power Macintosh 9500/132, excluding the 7200, 7500, and 8500 series.

List of Apple Computers Supported by Apple Personal Diagnostics Version 1.1.3:

MegaPhone: Frequently Asked Questions (5/96)

=====

Article Created: 16 August 1995
Article Reviewed/Updated: 9 May 1996

TOPIC -----

This article contains frequently asked questions (FAQ) on the Megaphone software that ships with Apple Telecom 2.x.

Questions in this FAQ:
=====

- 1) Is MegaPhone compatible with Power Macintosh computers and all AV equipped Macintosh computers?
- 2) Is MegaPhone compatible with PowerBook computers?
- 3) Why is there a 5 second lag after a caller hangs up and MegaPhone stops recording?
- 4) Can MegaPhone answer the phone if it is not running?
- 5) Can MegaPhone launch itself when a call comes in?
- 6) How do I set the number of rings to answer on?
- 7) If I answer a call from another phone in the house and it is a fax call, how can I receive it?
- 8) If someone is leaving a message, can I still talk to them?
- 9) Can I still use Call Waiting?
- 10) Where are saved messages kept?
- 11) Can I get a voice message back after I delete it?

- 12) The messages people are leaving are too loud or too soft. Can I adjust for this?
- 13) People are getting cut off when they are leaving messages. Can I adjust for this?
- 14) People leaving messages are saying they hear two beeps to start recording.
- 15) Can I use MegaPhone with Call ID?
- 16) Is MegaPhone Apple Scriptable?
- 17) Is MegaPhone Recordable?
- 18) People I am talking to complain of hearing an echo. Can I adjust for this?
- 19) When I make or receive calls the other party cannot hear me.
- 20) What modems are supported by MegaPhone?
- 21) What Apple bundles include MegaPhone?
- 22) What do these version numbers mean?
- 23) Where do I get support for MegaPhone?
- 24) When I try to make a call I don't get a dial tone and incoming calls are not getting answered. I'm sure my phone line is working and connected properly because I can use data communications applications. Is there something wrong with my modem or my computer?
- 25) Is a specific version of Apple Telecom software required to used MegaPhone with a GeoPort Telecom Adapter?
- 26) Is a specific version of GlobalFax software required to used MegaPhone with Global Village modems?
- 27) When should I use the Internal Modem Sound extension and when should I use the Audio Volume extension?
- 28) Can MegaPhone answer a call if the CPU has been put to sleep?
- 29) What is the relation between the volume control in MegaPhone and the Sound control panel?
- 30) Can I listen to an audio CD and use MegaPhone at the same time?

DISCUSSION -----

1) Question: Is MegaPhone compatible with Power Macintosh computers and all AV equipped Macintosh computers?

Answer: Yes. Note that earlier versions of MegaPhone are not supported on newer

CPUs. For example, versions prior to MegaPhone 1.0.2 are not supported on the Power Macintosh 7200, 7500, 8500, and 9500. Cypress Research and Apple both strongly recommend always using the latest version of both software packages on all CPUs.

2) Question: Is MegaPhone compatible with PowerBook computers?

Answer: Not yet. Contact Cypress Research for more information on this.

3) Question: Why is there a 5 second lag after a caller hangs up and MegaPhone stops recording?

Answer: MegaPhone is detecting the silence or dial tone on the line and needs to ensure the line is really silent before hanging up. Otherwise it might prematurely hang up on your callers. You can tell your callers to press # after their message if you want to minimize this delay.

4) Question: Can MegaPhone answer the phone if it is not running?

Answer: No. However, it can answer the phone if it is running in the background.

5) Question: Can MegaPhone launch itself when a call comes in?

Answer: No. However, it can answer the phone if it is running in the background.

6) Question: How do I set the number of rings to answer on?

Answer: In the Telephone Setup or Express Modem control panel in the general settings. This sets the number of rings for MegaPhone, Fax Software, and any other telephone software.

7) Question: If I answer a call from another phone in the house and it is a fax call, how can I receive it?

Answer: The best way to do this is to go to your computer and force a manual receive.

8) Question: If someone is leaving a message, can I still talk to them?

Answer: The GeoPort Telecom Adapter will allow switching between speaker phone and answering machine but due to the Comm Slot architecture, the Global Village modems must either answer the call or record a message.

9) Question: Can I still use Call Waiting?

Answer: Yes. When you hear the audible tone indicating you have another call, click on the Flash button or type "!". You will then switch to the other call. Click the flash button to switch back to the original call. There may be up to a five second delay before the line switches to the other call.

10) Question: Where are saved messages kept?

Answer: Saved messages are kept in a folder on your hard drive. Messages which you have already heard but not deleted can be found by following this path:

System Folder -> Preferences folder -> Cypress folder -> MegaPhone folder -> Messages folder.

You can double-click the messages to hear them again.

11) Question: Can I get a voice message back after I delete it?

Answer: No.

12) Question: The messages people are leaving are too loud or too soft. Can I adjust for this?

Answer: If you are using MegaPhone with a Global Village Teleport Gold IIv or Teleport Platinum V you can adjust the recording level. Go to the "Record/Playback" pane of the Telephone Setup control panel and adjust the mic gain level. Version 1.0.3P of MegaPhone slightly increased the recording volume. See the appendix in the MegaPhone for Performa manual for more details.

If you are using a GeoPort Telecom Adapter there are no user definable settings. The GeoPort software adjusts the recording level automatically.

13) Question: People are getting cut off when they are leaving messages. Can I adjust for this?

Answer: MegaPhone assumes a call has been terminated if it detects 5 seconds of silence or a fast busy tone.

If you are using MegaPhone with a Global Village TelePort Gold IIv or TelePort Platinum V you can adjust the silence threshold. Go to the "General" pane of the Telephone Setup control panel and adjust the silence threshold level. See the appendix in the MegaPhone for Performa manual for more details.

If you are using a GeoPort Telecom Adapter there are no user definable settings. The GeoPort software adjusts the silence threshold automatically.

14) Question: People leaving messages are saying they hear two beeps to start

recording.

Answer: The "Use recording beeps" feature is turned on in the Telephone Setup control panel. This feature should not be on because MegaPhone emits its own beeps.

Note: This does not apply when using a GeoPort Telecom Adapter since there is no Telephone Setup control panel.

15) Question: Can I use MegaPhone with Call ID?

Answer: Not yet because the modem hardware does not support it.

16) Question: Is MegaPhone Apple Scriptable?

Answer: Yes. It supports the standard suite of Telephony Apple Events such as make call, dial digits, and answer.

17) Question: Is MegaPhone Recordable?

Answer: No, not at this time. Contact Cypress Research about future product plans for this.

18) Question: People I am talking to complain of hearing an echo. Can I adjust for this?

Answer: Yes, if you have a separate microphone, speakers, or both. Usually adjusting the relative positioning of these changes the echo characteristic. This can particularly be a problem in an acoustically hot room.

19) Question: When I make or receive calls the other party cannot hear me.

Answer: It is likely that you have the input device in the Sound control panel set to some device other than the microphone. If you have verified that you have selected the microphone as your input device in the Sound control panel and you are able to input sound through the microphone in other programs, then use the search string "megaphone and performa" to locate the TIL article "Megaphone for Performa: I Hear Caller, They Cannot Hear Me" for more troubleshooting information. A frequent cause of this problem is the incorrect use of the External CD Sound extension.

20) Question: What modems are supported by MegaPhone?

Answer: At this time the only supported modems are the GeoPort Telecom Adapter from Apple, the TelePort Gold IIv and the TelePort Platinum V from Global Village.

..TIL18397-MegaPhone-Frequently_Asked_Questions_5-96_(TA34269).pdf

Note 1: The TelePort Gold IIv is installed internally in the Comm Slot. In the past, Apple has bundled the TelePort Gold II which is an external modem and does not have voice capability.

Note 2: The TelePort Gold IIv and Platinum V are sold only by Apple as part of a Performa bundle. Global Village does not sell these modems anywhere else. Apple is responsible for supporting these modems, not Global Village.

21) Question: What Apple bundles include MegaPhone?

Answer: MegaPhone 1.0.x is bundled with all GeoPort Telecom Adapters, MegaPhone 1.0.xSP is bundled with the Power Macintosh 7200, 7500, 8500, and 9500 computers, and MegaPhone 1.0.xP is bundled with several Performa bundles. See related TIL article: MegaPhone Version History.

22) Question: What do these version numbers mean?

Answer: The version numbers can be interpreted in the following way:

x.y.zL

x = major version number; increases with major feature set changes

y = minor version number; increases with minor feature set changes

z = bug fix version number; increases when a new release is made for bug fixes only

L = configuration modifier which can have the following values

P = Performa

SP = Power Macintosh 7200, 7500, 8500, and 9500

N = no security

J = localized for Japanese

All releases with the same x.y.z values are from the same set of code and therefore would have the same fixes and the same bugs. Every time a version is released, one of the x, y, or z numbers is increased even if not all configurations (L value) are released. Therefore, it is possible to have a 1.0.1P but no 1.0.1 out in customers' hands.

The feature sets for each configuration (L value) can differ. Briefly, the version without an L value has all features enabled for thirty days, at the end of thirty days it reverts to the Basic mode. The full feature set can be permanently activated by entering a code provided by Cypress upon payment of the upgrade fee. The SP configuration contains the Basic feature set only, and the P configuration falls somewhere between the Basic and full feature set. For more details please see related article: MegaPhone Version History.

23) Question: Where do I get support for MegaPhone?

Answer: Apple supports all versions of MegaPhone that are bundled with Apple products. Apple posts the MegaPhone software to many online services and is responsible for supporting those customers as long as they are using a supported

configuration (e.g. Neither Apple or Cypress would support MegaPhone on a Quadra 800). A customer that has purchased the full upgrade from Cypress is entitled to technical support from Cypress. Apple is not responsible for supporting the following versions: 1.0.xN and 1.0.xJ. See related TIL article: MegaPhone Version History.

24) Question: When I try to make a call I don't get a dial tone and incoming calls are not getting answered. I'm sure my phone line is working and connected properly because I can use data communications applications. Is there something wrong with my modem or my computer?

Answer: It is very unlikely something is wrong with your modem. Go to the MegaPhone General Preferences in the File Menu and make sure that you have the proper hardware selected. The Telephone Setup control panel may have the proper tool selected but unless the right tool is selected within the MegaPhone Preferences the application may not function. When you are using a Global Village modem, make sure you can send or receive a fax. Many data applications access the modem directly and do not use the Global Village software. By using the fax capabilities you can verify that the Global Village software is correctly installed. If the Global Village software is installed and you are unable to send a fax, then there may be something wrong with the modem.

The DemoDialer Telephone Tool is selected by default if an error is encountered or another tool is not available. The DemoDialer Telephone Tool will generate dialing tones that can be used to dial a phone by holding the receiver up to the computer's speaker.

The correct tool for the Global Village modems is the CRC TelePort TelTool. The correct tool for the Geoport Telecom Adapter is the GeoPort Telephone Tool.

25) Question: Is a specific version of Apple Telecom software required to used MegaPhone with a GeoPort Telecom Adapter?

Answer: MegaPhone 1.0 does not work with Apple Telecom 2.1 or later. MegaPhone 1.0.2 and later work with all versions of Apple Telecom 2.x. In general, both Apple and Cypress strongly recommend using the latest version of both MegaPhone and Apple Telecom.

26) Question: Is a specific version of GlobalFax software required to used MegaPhone with Global Village modems?

Answer: GlobalFax 2.5.4 or later should be used for the TelePort Gold IIv modem and GlobalFax 2.5.5 or later should be used for the TelePort Platinum V modem.

27) Question: When should I use the Internal Modem Sound extension and when should I use the Audio Volume extension?

Answer: The Audio Volume extension fixes some problems with "scratchy" sound on the 5200, 6200, 5300, and 6300 (see the TIL article "Performa 5200, 5300, 6200,

6300: Static Sound"). Apple recommends using the Audio Volume extension.

28) Question: Can MegaPhone answer a call if the CPU has been put to sleep?

Answer: Yes, for the Power Macintosh CPUs that support the sleep function (7200, 7500, 8500, 9500) the GeoPort will wake the CPU up when it receives an incoming call. Note: MegaPhone must be running at the time the CPU is put to sleep and you will hear more rings before the phone is answered due to the time it takes the CPU to wake up.

29) Question: What is the relation between the volume control in MegaPhone and the Sound control panel?

Answer: The volume slider in the MegaPhone application controls the volume for speaker phone functions independently of the settings in the Sound control panel.

30) Question: Can I listen to an audio CD and use MegaPhone at the same time?

Answer: If you are using a GeoPort, the audio program will be silent while MegaPhone is in use. If you are using a Global Village modem the audio from the CD will be mixed with the MegaPhone audio. It is recommended that you pause your CD while using MegaPhone in this situation.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Performa: Installers for QuickDraw GX and PowerTalk (8/95)

=====

Article Created: 16 August 1995

TOPIC -----

Where can I find the QuickDraw GX and PowerTalk installers on my Macintosh Performa computer?

DISCUSSION -----

If you have a Macintosh Performa 5200 or 6200 series computer, the installers are located on your Macintosh Performa CD. Follow the path:

System Software Files -> Apple Extras Files

If you have any other Macintosh Performa computer bundled with System 7.5, the installers will be on your hard disk. Follow the path:

Apple Extras -> System Software Extras

MacTCP: Routing Information Gateway Address (8/95)

Revised: 8/16/95
Security: Everyone

MacTCP: Routing Information Gateway Address (8/95)

=====

Article Created: 16 August 1995

TOPIC -----

What is the function of the "Routing Information: Gateway address" in the MacTCP control panel? What should I enter if I have multiple routers on the subnet? Why do I have trouble connecting even when I've entered this information correctly?

DISCUSSION -----

The Routing Information Gateway Address should be filled with the default router. Your network administrator will be able to give you that information based on the configuration of your network.

If you have multiple routers on a subnet, you should enter the router that is designated as the default router by the network administrator. If the network is not designed with a preference, have the administrator pick the router you should use.

Although MacTCP uses the default router for connecting to remote addresses that are not on the local subnet, MacTCP will obey any extra router information transmitted via RIP (Routing Information Protocol) broadcasts.

RIP response packets contain information on router addresses and the networks they route to. MacTCP stores RIP response packets as they arrive and uses any routing information provided.

Occasionally users find that MacTCP does not connect to hosts on remote networks. One possible cause is, a network with have routers that advertise incorrect RIP information, which causes MacTCP to use other, non-default routers. Restarting the Macintosh will temporarily clear the information, however, RIP broadcasts are usually sent every 30 seconds, and this is only a short term solution. The long term remedy is to have the network administrator properly configure any devices advertising RIP responses.

Apple Telecom 2.2 Fixes AudioTuneUp In Apple Telecom 2.1 (8/95)

Revised: 8/31/95
Security: Everyone

Apple Telecom 2.2 Fixes AudioTuneUp In Apple Telecom 2.1 (8/95)

Article Created: 17 August 1995
Article Reviewed/Updated: 31 August 1995

TOPIC -----

This article describes an issue with Internationally localized Apple Telecom 2.1 and AudioTuneUp which is installed on PCI-based Power Macintosh computers.

DISCUSSION -----

Below are the symptoms of a problem in AudioTuneUp installed by Apple Telecom 2.1, that were fixed by AudioTuneUp 1.0.1 in Apple Telecom 2.2. Anyone who has installed a localized version of Apple Telecom 2.1 should replace AudioTuneUp with version 1.0.1 which is included as part of Apple Telecom 2.2

The Sound control panel functions do not work as follows:

- Alert sounds:
 - The add button does not function.
 - A beep is not output when the alert volume slider is dragged up and down.
- Sound In: There is no sound source.
- Sound Out: Rate, Size, and Use are dimmed.
- Volumes:
 - The headphone volume scales disappear.
 - Mute doesn't work.
 - The volume's slider is fixed at MAX.

Article Change History:
31 Aug 1995 - Grammar correction.
21 Aug 1995 - Made minor correction.

Internet Server For WWW: About WebSTAR (8/95)

Revised: 8/17/95
Security: Everyone

Internet Server For WWW: About WebSTAR (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

This article provides information about WebSTAR a product of StarNine Technologies which is included on the Apple Internet Server For WWW.

DISCUSSION -----

WebSTAR is an HTTP server that lets you publish hypertext and multimedia documents to millions of World Wide Web (WWW) users around the world, right from your Macintosh computer. You can use WebSTAR to put any Macintosh file on the Web, including GIF and JPG images and even QuickTime' movies.

WebSTAR is completely compatible with all WWW clients, on any platform, including Mosaic', which started the Web revolution, and Netscape Navigator', the most popular Web client available today. WebSTAR is also fully compatible with any HTML (HyperText Markup Language) files you may have already developed. Just copy them onto your WebSTAR server Macintosh and you're set.

Through the power of AppleScript' and Apple events, WebSTAR can communicate with other applications on your Macintosh to publish any information contained in those programs. For example, if your company information is in a FileMaker" Pro database, Web client users can query it via HTML forms to get the data using the FileMaker CGI (Common Gateway Interface) for WebSTAR. It's powerful and easy to use.

StarNine also offers several add-on products for WebSTAR, including the Security Toolkit and the Commerce Toolkit. The Security Toolkit provides authentication and encryption capabilities for the WebSTAR server using the Secure Sockets Layer protocol to ensure that connections between Web clients and WebSTAR are completely private. The Commerce Toolkit adds support for commercial transactions via the First Virtual Internet Payment System'. Internet customers simply connect to the server and fill in an online order form. First Virtual automatically verifies the buyer and then notifies WebSTAR to complete the transaction. It's completely secure and reliable, and requires no additional

hardware or software. Other Internet payment schemes, including credit card transaction processing, will be supported in future releases.

WebSTAR comes with everything you need to create a killer Web site on any Macintosh. The WebSTAR CD-ROM Pack includes FTP and Gopher servers for sharing files across the Internet as well as a free evaluation copy of StarNine's ListSTAR, a companion product to WebSTAR that lets you create automated mailing lists (Listservers) and Email-On-Demand systems on the Internet. Sample AppleScripts and CGIs to connect WebSTAR with external applications are also included, and we've provided an online copy of WebMaster Macintosh, by Bob Levitus and Jeff Evans, the definitive reference for Macintosh Web site developers.

Some History

WebSTAR started out as MacHTTP, which has been widely used on the Web for several years. WebSTAR includes these long-standing features, which will be familiar to users of MacHTTP:

- Allows you to serve information to all WWW clients that support the HTTP/1.0 standard.
- Handles URL requests for text and binary documents, for example, for HTML (HyperText Markup Language) documents as well as GIF, JPEG, and other binary format files.
- Can execute AppleScripts and CGI applications, and can link to other external applications (such as FileMaker Pro, AppleSearch, or HyperCard") and return results to clients.
- Allows you to control access to the server by clients' domain name or IP address.
- Supports complete user name/password security for all files it serves.
- PowerPC native server.

Additional Information Resources

- To access the WebSTAR Home Page

The WebSTAR Home Page provides information about tools that work with WebSTAR, additional examples, product update information, and the latest versions of WebSTAR. To access the WebSTAR Home Page, use a WWW client to connect to the following URL:

<http://www.starnine.com/webstar.html>

- For MacTCP configuration

If you need to configure MacTCP, see the MacTCP Administrator's Guide. This document is included on the WebSTAR CD-ROM. Or, to access it on the World Wide Web, see the WebSTAR Home Page.

- For a complete reference on creating your Web site

See WebMaster Macintosh, by Bob Levitus and Jeff Evans, for a detailed information about creating your Web site. This document is included on the WebSTAR CD-ROM. Or, to access it on the World Wide Web, see the WebSTAR Home Page.

- For information about URLs

See the URL Primer, available from at this Web site:

<http://www.ncsa.uiuc.edu/demoweb/url-primer.html>

- For information about writing HTML documents

See the HTML Primer, available at this site:

<http://www.ncsa.uiuc.edu/demoweb/html-primer.html>

- For details about the Common Gateway Interface Standard

See the CGI overview, available at this site:

<http://hoohoo.ncsa.uiuc.edu/cgi/overview.html>

- For AppleScript tutorials

For information about writing AppleScripts and CGI applications for WebSTAR, see the Tutorials folder. This folder is included on the WebSTAR CD-ROM. Or, to access it on the World Wide Web, see the WebSTAR Home Page.

- For an ongoing discussion of WebSTAR issues

See the WebSTAR Home Page for details about how to subscribe to the following very active mailing list, which is dedicated to WebSTAR:

Apple Media Tool: Cross-Platform Issues W/ Corrupt Desktop 8/95

Revised: 8/17/95
Security: Everyone

Apple Media Tool: Cross-Platform Issues W/ Corrupt Desktop 8/95

=====

Article Created: 17 August 1995

TOPIC -----

I am having two problems with the Apple Media Tool. First, when I drop media onto the Cross-Platform Check applet, the icon does not highlight.

The second problem I am having is that the Cross-Platform Check session log reports errors that are not applicable to the type of media I am using. For example, the session log reports that a PICT file needs a .MOV file extension and it is in the wrong format.

DISCUSSION -----

Both problems are caused by corrupt desktop files. You need to disable Macintosh Easy Open and rebuild your desktop file. Apple Media Tool is incompatible with Macintosh Easy Open, so do not use them together.

Apple Media Tool: Dissolve Effects Require 256 colors (8/95)

Revised: 8/24/95
Security: Everyone

Apple Media Tool: Dissolve Effects Require 256 colors (8/95)

=====

Article Created: 17 August 1995
Article Reviewed/Updated: 24 August 1995

TOPIC -----

When working in an Apple Media Tool project, I cannot get the dissolve effect to work. Why?

DISCUSSION -----

In order to use the dissolve effect you must set both the project and your monitor to 256 colors. If you set the project to 256 colors, but your monitor is set to thousands or millions of colors, your projects work, but without the dissolve effects.

A 256-color project runs correctly after being compiled as a runtime because the runtime automatically switches the monitor to the correct settings. Runtime projects created with thousands or millions of colors will not display dissolve effects.

Changing Color Depth On A New Project

=====

Apple Media Tool

To change your project to a different color depth

- 1) Choose Preferences from the File menu
- 2) From the hierarchical menu choose Screen

Monitors Control Panel

To change your monitor to a different color depth

- 1) Open your Monitors control panel

- 2) Select the number of colors or grays you want
- 3) Close the Monitors control panel

Changing Color Depth On An Existing Project

=====

- 1) Create a New Project by choosing New from the File menu.
- 2) Set the preferences to the required settings
 - a) Choose Preferences from the File menu
 - b) From the hierachical menu choose Screen
- 3) Open the original project and choose Select All from the Edit menu
- 4) Choose Copy from the Edit menu
- 5) Switch to the Map window of the new project and Choose Paste from the Edit menu.

Article Change History:

24 Aug 1995 - Added how to change color depth on an existing project.

Apple Media Tool: Project Won't Run on PowerBook (8/95)

Revised: 8/17/95
Security: Everyone

Apple Media Tool: Project Won't Run on PowerBook (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

I created a project in Apple Media Tool to run on a PowerBook 540c. The screen preferences are set to 640x400 pixels, and the PowerBook is set to thousands of colors, but when I run the projects I get an error message saying that I need a larger monitor, or a monitor that supports thousands of colors.

DISCUSSION -----

Some PowerBooks actually have a vertical resolution of only 399 pixels instead of 400. In these cases, a 640x400 project will not run. To correct this, the project must be created or altered for a vertical resolution of 399 pixels.

Apple Media Tool: ISO 9660 Format CD Won't Play Runtime (8/95)

Revised: 8/17/95
Security: Everyone

Apple Media Tool: ISO 9660 Format CD Won't Play Runtime (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

I have a project created in Apple Media Tool, that works properly on the Macintosh, but after placing it on an ISO 9660 formatted Compact Disc, the project reports that it cannot locate certain files. All files are present and appear in the Media folder when viewed in the Finder.

DISCUSSION -----

The ISO 9660 file specification requires files to have a name of eight characters or less, plus a three-letter file extension. If you omit the file extension, the ISO 9660 requirement is not met and the Apple Media Tool runtime will not be able to locate the files.

Apple Media Tool: Runtime Maker Fails To Compile (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

I created a project in the Apple Media Tool and tried to compile it for both the Macintosh and MS Windows by clicking the appropriate checkboxes in the Runtime Maker. In some cases, the Runtime Maker fails to compile. In other cases, the finished runtime does not work. Why?

DISCUSSION -----

You should not compile a runtime for both the Macintosh and MS Windows at the same time. Create a runtime for one platform, then create the runtime for the other platform.

Apple Media Tool: Runtime Doesn't Reset Display Depth (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

The display settings have changed after running a program created with the Apple Media Tool. Is there a way to have the display settings switched back their original state?

DISCUSSION -----

Runtime applications created by the Apple Media Tool automatically switch monitor settings to the color depth specified in the runtime. However, it does not switch them back to the original settings after quitting the runtime, so you must switch them back manually.

Apple Media Tool: Project Fails to Compile or Run (8/95)

Revised: 8/17/95
Security: Everyone

Apple Media Tool: Project Fails to Compile or Run (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

I am having two problems with the Apple Media Tool. First, a project created in Apple Media Tool and saved as text will not compile using the runtime maker. Various errors occur, usually indicating an out-of-memory condition. Other times, a project created in Apple Media Tool and compiled with the Runtime Maker will not run. It quits immediately after opening.

DISCUSSION -----

The project may be too large to compile without the use of the Apple Media Tool Programming Environment. First try standard troubleshooting techniques, including:

- 1) Turn off all extensions except for QuickTime (and QuickTime Power Plug if using a Power Macintosh)
- 2) Remove, then reinstall the Apple Media Tool and Runtime Maker.
- 3) Allocate more memory to the Runtime Maker Application. It is not recommended to use virtual memory.

If none of the above methods correct the problem, check how many screens and media elements are contained in the project. If there are more than 200 screens and/or more than 1000 media elements, your project may be too large for the Runtime Maker to compile. These numbers are not "fixed", and may vary depending on the individual project.

The workaround is to decrease the number of screens or media elements used in the project.

The Apple Media Tool Programming Environment provides the ability to compile larger projects. The Apple Media Tool Programming Environment is available from APDA.

Apple Media Tool: Tips for Reducing Project Sizes (8/95)

Revised: 8/17/95
Security: Everyone

Apple Media Tool: Tips for Reducing Project Sizes (8/95)

=====

Article Created: 17 August 1995

TOPIC -----

This article provides tips for reducing the size of Apple Media Tool project sizes. It also provides information that helps decrease the problems you may experience during compiling because of the number of screens or media elements in a project.

DISCUSSION -----

To reduce the number of screens, you should try combining the contents of two screens onto one. You can then use the Hide and Show commands to control which objects are visible and which are hidden.

Examples

=====

To reduce two screens to one, select the contents of the second screen, copy them to the clipboard, then paste them onto the first screen.

Use the Hide Itself command under the Before Display action to hide all of the second screen objects.

Change the action that previously linked to the second screen to instead show the "second screen" contents while simultaneously hiding the "first screen" contents.

Here is what the original two screen project might look like.

Begin_Table

Screen	Object	Action	Command/Link
-----	-----	-----	-----
1	Picture1.PIC	Before Display	Disable Itself Show Itself

	Button.PIC	Before Display	Enable Itself Show Itself
		Mouse Up	Go to Screen 2
2	Picture2.PIC	Before Display	Disable Itself Show Itself

Here is what the combined screen project might look like.

Screen	Object	Action	Command/Link
-----	-----	-----	-----
1	Picture1.PIC	Before Display	Disable Itself Show Itself
	Picture2.PIC	Before Display	Disable Itself Hide Itself
	Button.PIC	Before Display Mouse Up	Enable Itself Show Itself Show Picture2.PIC Hide Picture1.PIC Hide Itself

End_Table

To reduce the number of media elements, you may want to try combining two PICT files of the same size into one two-frame QuickTime movie. The two frames can be addressed individually by using the "Go To Beginning" and "Go To End" commands.

Here is what the original two-PICT screen might look like.

Begin_Table

Object	Action	Command/Link
-----	-----	-----
Picture1.PIC	Before Display	Disable Itself Show Itself
Picture2.PIC	Before Display	Disable Itself Hide Itself
Button.PIC	Before Display Mouse Up	Enable Itself Show Itself Show Picture2.PIC Hide Picture1.PIC

Here is what the same screen might look like after combining the two PICT files into a two-frame QuickTime movie.

Object	Action	Command/Link
-----	-----	-----

Movie.MOV	Before Display	Disable Itself
		Go To Beginning of Itself
		Show Itself
Button.PIC	Before Display	Enable Itself
		Show Itself
	Mouse Up	Go To End of Movie.MOV

End_Table

NOTE: When consolidating screens, it is important to remember that increasing the number of media elements on a screen slows the overall performance of a project, so it is recommended that no more than two screens be combined into one.

By combining these two techniques, you can potentially reduce the number of screens and PICT media elements by as much as one half.

Sound Manager 3.1: Improves Power Macintosh Sound (1/96)

Revised: 1/26/96
Security: Everyone

Sound Manager 3.1: Improves Power Macintosh Sound (1/96)

Article Created: 17 August 1995
Article Reviewed/Updated: 26 January 1996

TOPIC -----

Will I notice any improvement in the sound performance on my Power Macintosh computer after upgrading to Sound Manager v3.1?

DISCUSSION -----

The following table shows the real time usage of the central processor on a Power Macintosh 6100/60 computer under various test cases playing a single sound. The percentage refers to how much of the processor's time is spent executing the code to play the sound in the given case. This compares the emulated 68040 processor code of the previous Sound Manager with the new fully native PowerPC code of Sound Manager 3.1 software.

You can expect the new Sound Manager to perform 4-6 times faster on your Power Macintosh computer. The sound input interrupt handler was also optimized, and you can expect it to be 7-9 times faster.

Begin_Table

PowerMac 6100/60 -----	Emulated 68k -----	Native PowerPC* -----
8bit, mono	5%	1.6%
8bit, mono, w/sample rate conversion	12%	2.2%
16bit, stereo	13%	1.9%
16bit, stereo, w/sample rate conversion	26%	2.3%
16bit, stereo, w/sample rate conversion, IMA	41%	6.6%

* Overall performance may be affected by other extensions or control panels.

End_Table

Article Change History:

..TIL18413-Sound_Manager_3-1-Improves_Power_Macintosh_Sound_1-96_(TA34285).pdf

26 Jan 1996 - Clarified what the percentages are indicating.

At Ease 3.0: Shut Down from Login Panel Hangs (2/96)

Revised: 2/27/96
Security: Everyone

At Ease 3.0: Shut Down from Login Panel Hangs (2/96)

=====

Article Created: 18 August 1995
Article Reviewed/Updated: 5 January 1996

TOPIC -----

I am experiencing a problem with my At Ease for Workgroups 3.0 lab. When I click the Shut Down button in the At Ease login panel, the pane disappears and the only items on my screen are the spinning cursor and menu bar. The spinning cursor continues until I either turn the power to the computer off or disconnect the workstation from the AppleShare 4.1 server.

This problem occurs on any workstation that is the first to try to shut down from this login panel. While the cursor is spinning, all other computers on the At Ease 3.0 network can shutdown from this panel without any problem. If I interrupt the spinning cursor, the next machine that I try to shut down from the login pane exhibits the same thing.

I can shut down from the Finder or the At Ease panels without any problems.

DISCUSSION -----

If you click the Shut Down button on the At Ease login pane while there is an active connection to the file server, the computer hangs with a spinning cursor. If you are disconnected from the server, the At Ease machine completes its shutdown. This occurs on both LocalTalk and Ethernet networks.

This problem only occurs when AppleShare Workstation (client) version 3.6 or 3.6.1 is installed on the client At Ease 3.0 computer.

This problem has been fixed in At Ease for Workgroups 3.0.1. The At Ease for Workgroups Updater 3.0.1 is available from online services.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple

software updates.

- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

27 Feb 1996 - Minor typographical corrections.

05 Jan 1996 - Added fix availability information.

28 Nov 1995 - Added AppleShare Workstation 3.6.1 information.

Plaintalk 1.4.1: AppleScript for Universal Quit (8/95)

Revised: 8/29/95
Security: Everyone

Plaintalk 1.4.1: AppleScript for "Universal Quit" (8/95)

Article Created: 18 August 1995
Article Reviewed/Updated: 29 August 1995

TOPIC -----

Is it possible to create a universal "Quit" (like Close Window) for any application?

DISCUSSION -----

A first attempt at an AppleScript to quit an application is as simple as the following:

```
tell application "Finder"
    set AppName to name of every process whose frontmost is true
end tell
tell application AppName to quit
```

Call it "Quit Application", since speech recognition seems to be able to better discern things that are more than one syllable.

This worked fine for most cases. Other cases to handle are desk accessories (not scriptable at all), old applications that do not support the core AppleEvents and the Finder itself. This involved more checking and trapping of errors. Instead of putting up dialogs to display error messages, these additional lines of code will cause the Macintosh to speak the error messages in response to a spoken command.

Begin_Table

By adding more error checking, the script evolved into:

```
property SpeakErrs : true -- false => display dialog

try
```

```
set AppScriptable to false
set AppName to "the current process" -- initialize from leftover values
tell application "Finder"
set ProcName to every process whose frontmost is true
if ProcName is not {} then --something other than Finder
set AppName to the name of every process whose frontmost is true
--kinds are "application program", "desk accessory"
set ProcKind to kind of file of every process whose frontmost is true
with timeout of 5 seconds -- sluggish section for unresponsive applications
if ProcKind is "application program" then
set AppScriptable to ¬
    the scriptable of file of every process whose frontmost is true
else
set Msg to "Sorry, cannot quit " & ProcKind & AppName & ¬
    ". It does not support scripting."
end if
end timeout
else
set AppName to "Finder"
set Msg to "You should not quit the Finder."
end if
end tell

-- note: this section operates in the context of the frontmost application
-- in case dialogs are displayed
if AppScriptable then
with timeout of 3 seconds
tell application AppName to quit
end timeout
else
GiveError(Msg)
end if

on error ErrMsg number ErrNmbr
-- - 903 = no PPC port; i.e. not scriptable
-- -2704 = application not scriptable
if ErrNmbr = -903 or ErrNmbr = -2704 then
set Msg to AppName & ¬
    " is not scriptable or does not support the quit AppleEvent."
GiveError(Msg)
else
log ("Error " & ErrNmbr & ": " & ErrMsg)
display dialog "Error " & ErrNmbr & ": " & ErrMsg
end if
end try

on GiveError(TheMsg)
if SpeakErrs then
say TheMsg
else
display dialog TheMsg buttons {"OK"} default button 1
end if
end GiveError
```

End_Table

Article Change History:

29 Aug 1995 - Corrected unclear language.

Plaintalk 1.4.1: Speakable Items Application Creation (8/95)

Revised: 8/18/95
Security: Everyone

Plaintalk 1.4.1: Speakable Items Application Creation (8/95)

=====

Article Created: 18 August 1995

TOPIC -----

How are the standalone applications in the Speakable Items folder, with the diamond & ear icon, created? Can I create these?

DISCUSSION -----

The little speakable applications with an ear on the icon are custom applications designed for PlainTalk on PowerMac only. They have no code resource that you would find on a 680x0 application. If launched on a 68K machine, they produce a -192 error (resource not found). You could write similar applications in C, C++, or Pascal that make general toolbox calls or send AppleEvents to perform actions.

The "What time is it?" and "What day is it?" applications perform actions that were similar to the QuicKeys functions supplied with previous versions of PlainTalk using the Speech Macro Editor. You could write similar Applets in AppleScript to perform these functions.

The "Tell me a joke" application picks one of 22 different Knock Knock jokes stored internally. A custom application performs faster than a corresponding AppleScript could, doing the same function.

The "Close window" application operates for any application environment, whether the application is scriptable or not. This function could not be performed across all applications using AppleScript.

The "open Speech Introduction" application simply opens the Guide file and could also be performed in AppleScript using the AGStart Scripting addition.

Macintosh PowerBook 5300/100: Description (Discontinued)

Article Created: 17 August 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 5300/100 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook 5300/100 provides the high performance of PowerPC processor technology and long battery life at a great price. It is the ideal mobile system for handling word processing, spreadsheets, and communications.

Featuring an advanced 100-megahertz PowerPC 603e processor, the PowerBook 5300/100 lets mobile users experience the true power of desktop computing—all in a system that weighs less than 6 pounds. It provides 16-bit, CD-quality stereo sound, and its full-page-width, passive-matrix display offers high contrast and 16 levels of gray. It also comes with 8-bit color video-out to support external displays. And the power of its RISC processor not only lets the PowerBook 5300/100 handle the most complex tasks easily, but also enables it to run Insignia Solutions SoftWindows emulation software for DOS and Windows compatibility.

Already powerful, the PowerBook 5300/100 is designed to make expansion easy. You can expand the memory to 64 megabytes, or opt for a larger, 10.4-inch active-matrix color display. The PowerBook 5300/100 also features two PC Card slots as well as an expansion bay for third-party solutions—the floppy disk drive can be removed and replaced with an additional hard disk drive, magneto-optical storage device, or internal AC adapter.

Because communication is so vital to mobile users, the PowerBook 5300/100 offers a range of networking and communications capabilities. It features built-in

..TIL18421-Macintosh_PowerBook_5300-100-Description_Discontinued.pdf

infrared technology for easy file sharing without cable connections or time-consuming set-up. Through its PC Card slots, you can add a wired or wireless modem, storage, or Ethernet networking capability.

With its combination of high performance, expandability, and affordability, the PowerBook 5300/100 is the ideal choice.

Features

=====

High Performance

- Uses a 100-MHz PowerPC 603e processor
- Includes a high-capacity internal 500 MB hard disk drive
- Runs thousands of Mac OS applications and hundreds of applications optimized for Power Macintosh Innovative design
- Provides a 9.5-inch (diagonal), backlit, passive-matrix, gray-scale display with 16 levels of gray
- Features PC Card slots and an expansion bay, for flexibility and expandability
- Comes with an integrated Apple trackpad, full-size keyboard, and integrated palm rest
- Uses a long-lasting Nickel-Metal-Hydrate (NiMH) battery

Easy And Versatile Communications Capabilities

- Provides built-in infrared technology for easy file sharing -- no cables necessary
- Lets you add a wired or wireless modem or Ethernet networking capabilities through PC Card slots
- Comes with a range of communications software to keep you connected

Multimedia Support

- Comes with 8-bit color video-out, upgradable to greater bit depths
- Provides built-in speaker; 16-bit, CD-quality stereo line input and sound output; and an integrated microphone
- Includes expansion bay for removable, rewritable media such as a magneto-optical drive
- Includes QuickTime software

Preinstalled Software

- Comes with System 7.5.2
- Provides active assistance in learning new features through Apple Guide
- Comes with the PowerBook Mobility Bundle, software designed to enhance mobile computing

Bundled Software

Each configuration comes with the PowerBook Mobility Bundle. The Bundle includes the following components:

- PowerTalk 1.0
- Macintosh PC Exchange
- Macintosh Easy Open
- Apple Remote Access
- PowerBook Control Strip
- Floppy Disk Maker
- Disk Image Mounter
- Password Protection Software
- Eric's Ultimate Solitaire Sample
- Spin Doctor
- Super Maze Wars
- PowerBook Demo

What's In The Box

The following components are expected to be included in the box with all Macintosh PowerBook 5300 computers:

- Macintosh PowerBook 5300 computer
- Macintosh PowerBook 5300 User's Guide
- Macintosh PowerBook 5300 Technical Specifications sheet
- ARA Client User's Guide
- ARA Promotion Flyer
- Registration card
- Packing List
- Disk Tools diskette
- Power Cord
- AC adapter
- Protective Battery Cap/Cover
- Expansion Bay PC Card Storage Module
- Resource Guide including
 - Warranty
 - Software License Agreements
 - Apple logo decals
 - Citibank VISA Brochure and Application
 - Tote Bag Catalog

Macintosh PowerBook 5300/100:Technical Specs (Discontinued)

=====

Article Created: 18 August 1995
Article Reviewed/Updated: 26 August 1996

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook 5300/100 computer.

DISCUSSION -----

Microprocessor

- 100-MHz PowerPC 603e

Memory

- 8 MB of RAM, expandable to 64 MB
(Note: The 8 MB from Apple is soldered onto the logic board. There is one RAM card expansion slot for expanding memory.)

Storage

- Built-in removable Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal 500 MB hard disk drive
- Expansion bay for third-party solutions such as an additional hard disk drive or magneto-optical drive (PC Card storage tray included in box may be inserted into this bay to reduce weight by 0.4 lb.)

Display

- 9.5-in. (diagonal) backlit, passive-matrix display
- Resolution: 640 by 480 pixels with 16 levels of gray

Battery

- Nickel-Metal-Hydride battery provides 2.5 to 4.5 hours of use before recharge
- Battery recharges in 2 hours while computer is shut down or in sleep mode; 4 hours while running
- PowerBook Control Strip lets you monitor time remaining, charge status, and battery usage

PC Card slots (PCMCIA)

- Two PC Card slots that can accommodate two Type I or II PC Cards or one Type III PC Card
- Lets you add industry-standard PC Cards such as Ethernet networking, a wired or wireless modem, storage, or other capabilities Expansion bay
- IDE connector for third-party solutions such as an additional hard drive, a magneto-optical drive, and other devices
- Power lines for connection of an internal AC adapter and other third-party solutions

Ports

- One Apple Desktop Bus (ADB) port
- One serial (RS-422) port
- One SCSI port for connecting as many as six external devices (including CD-ROM)
- One power adapter port
- Stereo sound input port
- Stereo sound output port
- Video output port

Networking

- Serial/LocalTalk port for AppleTalk connections to networks and printers
- Ethernet networking through PC Cards
- Ultra-easy file sharing through infrared technology—without cable connections or time-consuming setup; supports AppleTalk protocol

Built-in stereo sound

- 16-bit, CD-quality stereo sound capable of driving headphones or external speakers
- Built-in speaker and integrated microphone
- Digital-to-analog conversion sampled at 44.1, 22.05, or 11.025 kHz
- 16 bit, audio line-in for recording

Video output

- 8-bit video output port to support external color displays—compatible with most Apple, VGA, and SVGA monitors (upgradable to greater bit depths through third-party solutions)

Security

- Includes a security slot that secures the system, battery, and expansion

bay (requires a third- party accessory)

- Includes password protection software

Keyboard and Apple trackpad

- Built-in, full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys and integrated palm rest
- Power button on keyboard
- Solid-state Apple trackpad provides precise cursor control in response to the movement of the user's fingertip over its surface; sensing of movement and acceleration is easily adjustable through a control panel

Disability access

- System software includes CloseView and Easy Access, and provides the ability to substitute visual cue for beep

Electrical requirements

- Line voltage: 100 to 240 volts AC
- Frequency: 50 to 60 Hz

ADB power requirements

- Maximum current draw for all ADB devices: 200 mA

Environmental requirements

- Operating temperature: 41 degrees to 95 degrees F (5 degrees to 35 degrees C)
- Storage temperature: -13 degrees to 140 degrees F (-25 degrees to 60 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Size and weight

- Height: 2.0 in. (5.1 cm)
- Width: 11.5 in. (29.2 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 5.9 lb. (2.7 kg)

Retrospect: How To Backup All Duplicate Files (8/95)

Revised: 8/18/95
Security: Everyone

Retrospect: How To Backup All Duplicate Files (8/95)

=====

Article Created: 18 August 1995

TOPIC -----

Customer wants to back up entire drive every day, even if the files are unchanged. Using a "Full" backup works, but it does so by deleting the previous backups that occurred in the storage set.

DISCUSSION -----

The method you want, is to use a single storage set with specific options selected. You should configure Retrospect to do a normal backup to the same storage set every time. Also you should not choose the "Don't match duplicates" option (this is selected by default, be sure to deselect it).

Here are the steps used in an example:

Step 1

Create new script for backing up one file.

Step 2

Run backup the first time. Check the log, the file was backed up.

Step 3

Immediately run backup again and check the log. Since there are no changes, the file was not backed up.

Step 4

Edit the script's options. Select, More Options. Select, Matching. Turn off Don't add duplicates to storage set.

Step 5

Immediately run backup again. Notice the file was backed up, even though no changes were made to the file.

Below is a sample log file:

Begin_Table

```

Macintosh PowerBook 5300c/100: Description (9/97)

Article Created: 17 August 1995
Article Reviewed/Updated: 19 April 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 5300c/100 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook 5300c/100 provides the high performance of PowerPC processor technology and long battery life in the highest-quality color PowerBook. Its advanced color display makes it ideal for work with graphics or presentations.

Featuring an advanced 100-mega-hertz PowerPC 603e processor, the PowerBook 5300c/100 lets mobile users experience the true power of desktop computing—all in a system that weighs only 6.2 pounds. It provides 16-bit, CD-quality stereo sound and a full-page-width, active-matrix display. The PowerBook 5300c/100 comes in two configurations: one with 512 kilobytes of VRAM, supporting 256 colors; the other with 1 megabyte of VRAM, supporting thousands of colors. It also comes with 8-bit color video-out to support external displays. And the power of its RISC processor not only lets the PowerBook 5300c/100 handle the most complex tasks easily, but also enables it to run Insignia Solutions SoftWindows emulation software for DOS and Windows compatibility.

Already powerful, the PowerBook 5300c/100 is designed to make expansion easy. You can expand the memory to 64 megabytes. The PowerBook 5300c/100 also features two PC Card slots as well as an expansion bay for third-party solutions—the floppy disk drive can be removed and replaced with an additional hard disk drive, magneto-optical storage device, or internal AC adapter.

Because communication is so vital to mobile users, the PowerBook 5300c/100

..TIL18424-Macintosh_PowerBook_5300c-100-Description_9-97.pdf

offers a range of networking and communications capabilities. It features built-in infrared technology for easy file sharing without cable connections or time-consuming setup. Through its PC Card slots, you can add a wired or wireless modem, storage, or Ethernet networking capability.

With its power, expandability, and high-quality color display, the PowerBook 5300c/100 is a portable computer that truly does not compromise on quality.

Features

=====

High Performance

- Uses a 100-MHz 603e processor
- Includes a high-capacity internal 500 MB or 750 MB hard disk drive
- Runs thousands of Mac OS applications and hundreds of applications optimized for Power Macintosh

Innovative Design

- Provides a 10.4-inch (diagonal), backlit, active-matrix, color display with 256 or thousands of colors
- Features PC Card slots and an expansion bay, for flexibility and expandability
- Comes with an integrated Apple trackpad, full-size keyboard, and integrated palm rest
- Uses a long-lasting lithium-ion battery

Easy And Versatile Communications Capabilities

- Provides built-in infrared technology for easy file sharing—no cables necessary
- Lets you add a wired or wireless modem or Ethernet networking capabilities through PC Card slots
- Comes with a range of communications software to keep you connected
- Comes with 8-bit color video-out, upgradable to greater bit depths
- Provides built-in speaker; 16-bit, CD-quality stereo line input and sound output; and an integrated microphone
- Includes expansion bay for removable, rewritable media such as a magneto-optical drive
- Includes QuickTime software

Preinstalled Software

- Comes with System 7.5.2
- Provides active assistance in learning new features through Apple Guide
- Comes with the PowerBook Mobility Bundle, software designed to enhance mobile computing

Bundled Software

Each configuration comes with the PowerBook Mobility Bundle. The Bundle includes

the following components:

- PowerTalk 1.0

A/UX or AWS 95: Starting From Install CD-ROM (8/95)

=====

A/UX or AWS 95: Starting From Install CD-ROM (8/95)
Article Created: 18 August 1995

TOPIC -----

What files and information are needed to boot from the Installation CD-ROM? I would like to configure my MacPartition to boot my installer CD-ROM if necessary. I also want to know how to properly configure my floppy drive.

DISCUSSION -----

The boot floppy used to startup from the CD-ROM is different from your MacPartition in three ways:

- The extensions folder of the system folder contains a file "CD hack"
- The disk level contains a A/UX startup document called "boot_CD"
- The Preferences Booting dialog box in A/UX startup are configured:
 - Automatically boot at startup, is selected.
 - Autorecovery is set for "boot_cd -d" as custom command.
 - Autolaunch is set for shutdown.

NOTE: The A/UX installer startup is slightly different than the A/UX startup application, however, A/UX startup does support booting from CD-ROM.

PowerTalk: Frequently Asked Questions (11/95)

Article Created: 18 August 1995
Article Reviewed/Updated: 9 November 1995

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about PowerTalk.

Questions in this FAQ

- I just did a Clean Install. What files should be dragged over from the old system to the new one to retain the PowerTalk settings, passwords, and Mail?
- Either through the Key Chain, or initially setting up PowerTalk, I select to search for a PowerShare server where I have an account setup, but it tells me that there are no PowerShare services. I know that the server is up. What is going on?
- There are items in my Out Tray whose status show as "waiting." I need these mailed immediately. What's wrong?
- I forgot my Access Code (keychain password). How can I reset it?
- I cannot find the Mailbox or the Catalogs icon, they are gone. What happened?
- My AppleTalk or PowerShare catalogs are dimmed in the Catalogs window. What is wrong?
- I get a message that the system can no longer access a server on my network. In some cases a Resolve button appears in the notification dialog box. What do I do?
- When I try to open mail or delete mail from the In Tray, a message comes up "The Command can't be completed because it cannot be Found." What is happening?
- How do I recover missing mail?

- How do I use PowerTalk to retrieve mail from other services (Internet, fax, other mail applications)?

DISCUSSION -----

Question: I just did a Clean Install. What files should be dragged over from the old system to the new one to retain the PowerTalk settings, passwords, and Mail?

Answer: Be sure that PowerTalk has been installed on the new System Folder. Drag the PowerTalk Data Folder from the root level of the System Folder, and the PowerTalk Setup and PowerTalk Startup preferences from the Preferences folder to the new System Folder.

Question: Either through the Key Chain, or initially setting up PowerTalk, I select to search for a PowerShare server where I have an account setup, but it tells me that there are no PowerShare services. I know that the server is up. What is going on?

Answer:

- Check to make sure that they are in fact connected to the network.
- Check Network control panel and make sure the Chooser does see at least a LaserWriter Printer or other servers.
- Check that your Date & Time Control Panel is correct (PowerTalk services will not work if your date is reset to 1904)

Question: There are items in my Out Tray whose status show as "waiting." I need these mailed immediately. What's wrong?

Answer: See Question #2 above. When there are problems with the Out Tray, a Problem Alert box will sometimes appear in the upper right corner of the In Tray and or Out Tray window. Selecting the button will bring up the "MailBox Problems" window, describing the problem and also some solutions. There is also a button called Resolve that will attempt to correct the issue.

Question: I forgot my Access Code (keychain password). How can I reset it?

Answer: Follow these steps to reset your password:

Step 1

Turn off collaboration services in the PowerTalk control panel.

Step 2

Throw the two PowerTalk Setup Preferences files in the Preferences folder away.

Step 3

Restart the computer.

Step 4

Double-click on the mailbox to re-define PowerTalk services.

WARNING: All key chain information is lost when you delete the PowerTalk Setup Preferences.

Question: I cannot find the Mailbox or the Catalogs icon, they are gone. What happened?

Answer: PowerTalk may be turned off or the PowerTalk extensions may have been removed from the system folder. Try troubleshooting with the following suggestions:

- Check to see that the PowerTalk Extension and PowerTalk Manager are present in the Extensions Folder.
- Check to see if Extension Manager was used to deactivate the PowerTalk Extension and PowerTalk Manager.
- Go to the PowerTalk Setup Control Panel and make sure it is active.

Question: My AppleTalk or PowerShare catalogs are dimmed in the Catalogs window. What is wrong?

Answer: AppleTalk is inactive. Go to the Chooser and activate AppleTalk.

Question: I get a message that the system can no longer access a server on my network. In some cases a Resolve button appears in the notification dialog box. What do I do?

Answer:

- Click the button to reconnect.
- Check the cable connection on the back of your computer.
- Check that your Date & Time Control Panel is correct (PowerTalk services will not work if your date is reset to 1904)

Question: When I try to open mail or delete mail from the In Tray, the following message appeared, "The Command can't be completed because it cannot be Found." What is happening?

Answer: You have an account on a PowerShare Server, and have two PowerTalk-equipped systems accessing the same account. The mail has been removed

..TIL18426-PowerTalk-Frequently_Asked_Questions_11-95_(TA34296).pdf

from the In Tray on one system, yet the In Tray of the other system shows the mail. Two solutions:

- Click "OK" when throwing away the item to remove it from the system.
- See "How to recover missing mail" (question 10) for details. Basically, drag the blank icon(s) from the IPM Bin folder on top of the AppleMail application, and AppleMail will launch and either show the document, or enclose the item that was mailed.

Question: How do I recover missing mail?

Answer: There are two ways to recover the missing mail:

- Look in System Folder:PowerTalk Data:IPM Bin folder path. All of the messages are still there with blank icons and 8-digit file names. You can simply drag the files over the AppleMail application and they will launch and display your messages, attachments included. You can also open the files within AppleMail, and do a Save As to restore the original type and creator so the files are double-click able AppleMail documents again. Although untested, this procedure should apply to messages created by other PowerTalk applications.
- Change the file type and creator of the files with the 8-digit file names found in System Folder:PowerTalk Data:IPM Bin using a file utility such as FileType, Disk Top or ResEdit. Original type: ltr and creator:lap2. Then move the files out of "IPM Bin", and open them with AppleMail (or appropriate mail application). NOTE: Disk and resource editors are not supported by Ask Apple or 800-SOS-APPL.

Question: How do I use PowerTalk to retrieve mail from other services (Internet, fax, other mail applications)?

Answer: You need a PSAM. PSAM stands for Personal Message Access Module. These are extensions that offer connections to other mail services, such as QuickMail and Internet gateways. To the PowerTalk user, the MailBox metaphor remains the same but data is seamlessly passed to other services. Two examples of PSAMs would be StarNine's Mail*Link for PowerTalk/QM and Mail*Link for PowerTalk/MS

AppleCD 600i: Compatible Macintosh Models (6/96)

Article Created: 18 August 1995
Article Reviewed/Updated: 27 June 1996

TOPIC -----

Which computers can use the AppleCD 600 CD-ROM drive?

DISCUSSION -----

Apple has tested the AppleCD 600 quad-speed drive with all Macintosh computers currently shipping and many older Macintosh computers. Apple is supporting the AppleCD 600 CD-ROM drives on Macintosh computers with 25 MHz 68030 processors or faster, with the exception of the Macintosh IIfx.* Slower computers may still work with the AppleCD 600, but are not supported based on our current information.

Several Macintosh computers ship with the AppleCD 600i already installed, including:

- Power Macintosh 5400/120
- Power Macintosh 7200 series
- Power Macintosh 7500 series
- Power Macintosh 7600 series
- Power Macintosh 8500 series
- Power Macintosh 9500 series
- Power Macintosh 5300/100 LC
- Macintosh Performa 5300
- Macintosh 5200 series**
- Macintosh Performa 6200 series**
- Macintosh Performa 6300, 6290, 6320

The AppleCD 600i internal upgrade kit (M4070LL/A) is available and can be installed using the same mounting brackets as the AppleCD 300i.

*NOTE: This computer listing does not include these Macintosh models: 128k, 512k, 512ke, Plus, SE, SE FDHD, Classic, Classic II, Mac II, IIfx, IIfx, SE/30, LC, LC II, IIsi, Portable, Portable Backlit, PowerBook 100, PowerBook 140, Color

Classic.

****Note:**The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

The following computers are in the Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

Macintosh PowerBook 5300c/100:Technical Specifications (9/96)

=====

Article Created: 18 August 1995
Article Reviewed/Updated: 11 September 1996

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook 5300c/100 computer.

DISCUSSION -----

Microprocessor

- 100-MHz PowerPC 603e

Memory

- 8 MB* or 16 MB of RAM, expandable to 64 MB
[Note: The 8 MB or 16 MB (depending on the model) from Apple is soldered onto the logic board. There is one RAM card expansion slot for expanding memory.]

NOTE:

- * The PowerBook 5300c/8/500 configuration was discontinued in 9/96.

Storage

- Built-in removable Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal 500 MB** or 750 MB hard disk drive
- Expansion bay for third-party solutions such as an additional hard disk drive or magneto-optical drive (PC Card storage tray included in box may be inserted into this bay to reduce weight by 0.4 lb.)

NOTE:

- ** The PowerBook 5300c/8/500 configuration was discontinued in 9/96.

Display

- 10.4-in. (diagonal), backlit, active-matrix, color display
- Resolution: 640 by 480 pixels
- Comes in two configurations: one with 512K of VRAM, supporting 256 colors; the other with 1 MB of VRAM, supporting thousands of colors
- Black matrix screen reduces glare, clearly defines colors, and improves contrast

Battery

- Nickel-Metal-Hydride battery provides 2.5 - 4 hours of use before recharge
- Battery recharges in 2 hours while computer is shut down or in sleep mode; 4 hours while running
- PowerBook Control Strip lets you monitor time remaining, charge status, and battery usage

PC Card slots (PCMCIA)

- Two PC Card slots that can accommodate two Type I or II PC Cards or one Type III PC Card
- Lets you add industry-standard cards such as Ethernet networking, a wired or wireless modem, storage, or other capabilities Expansion bay
- IDE connector for third-party solutions such as an additional hard drive, a magneto-optical drive, and other devices
- Power lines for connection of an internal AC adapter and other third-party solutions

Ports

- One Apple Desktop Bus (ADB) port
- One serial (RS-422) port
- One SCSI port for connecting as many as six external devices (including CD-ROM)
- One power adapter port
- Stereo sound input port
- Stereo sound output port
- Video output port

Networking

- Serial/LocalTalk port for AppleTalk connections to networks and printers
- Ethernet networking through PC Cards
- Ultra-easy file sharing through infrared technology—without cable connections or time-consuming setup; supports AppleTalk protocol

Built-in Stereo Sound

- 16-bit, CD-quality stereo sound capable of driving headphones or external speakers
- Built-in speaker and integrated microphone
- Digital-to-analog conversion sampled at 44.1, 22.05, or 11.025 kHz
- 16 bit, audio line-in for recording

Video Output

- 8-bit video output port to support external color displays—compatible with most Apple, VGA, and SVGA monitors (upgradable to greater bit depths through third-party solutions)

Security

- Includes a security slot that secures the system, battery, and expansion bay (requires a third-party accessory)
- Includes password protection software

Keyboard and Apple trackpad

- Built-in, full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys and integrated palm rest
- Power button on keyboard
- Solid-state Apple trackpad provides precise cursor control in response to the movement of the user's fingertip over its surface; sensing of movement and acceleration is easily adjustable through a control panel

Disability access

- System software includes CloseView and Easy Access, and provides the ability to substitute visual cue for beep

Electrical requirements

- Line voltage: 100 to 240 volts AC
- Frequency: 50 to 60 Hz

ADB power requirements

- Maximum current draw for all ADB devices: 200 mA

Environmental requirements

- Operating temperature: 41 degrees to 95 degrees F (5 degrees to 35 degrees C)
- Storage temperature: -13 degrees to 140 degrees F (-25 degrees to 60 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Size and weight

- Height: 2.2 in. (5.3 cm)
- Width: 11.5 in. (29.2 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 6.2 lb. (2.8 kg)

Color LaserWriter 12/600 PS: How to Clean Up Fuser Oil (10/96)

Revised: 10/23/96
Security: Everyone

Color LaserWriter 12/600 PS: How to Clean Up Fuser Oil (10/96)

Article Created: 18 August 1995
Article Reviewed/Updated: 28 June 1996

TOPIC -----

What should I use to clean fuser oil that has spilled onto my Color LaserWriter 12/600 PS?

DISCUSSION -----

The Color Laserwriter 12/600 PS and Color LaserWriter 12/660 PS printers uses a silicone based oil that can easily be cleaned up from the exterior plastic case using a lint free cloth and a mild non-abrasive household cleaner/degreaser such as Fantastik™ or 409™. Spray a small amount of the cleaner onto the cloth and wipe the plastic case. Do not allow any cleaning solution to enter into the printer.

Oil that has spilled onto the photoconductor, transfer drum, or paper feed rollers can be cleaned by printing on lint free paper until all of the oil is absorbed. Usually anywhere from 5-50 sheets of paper will remove the oil. Do not use ammonia-based or alcohol based cleaners on or near the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printers.

To prevent damage to the photoconductor, do not touch or use any cleaning materials on the delicate gray roller that is the photoconducting surface. The photoconductor may be damaged from scratches or contamination due to oil or fingerprints. Image quality defects in the printed output may result with areas of light print, scratches or banding that repeat vertically down the page every 5.07" (129mm). The defects are typically visible in areas that have toner applied to them.

For other issues concerning fuser oil used on the Color LaserWriter 12/600 PS, refer to "Color LaserWriter 12/600 PS: Fuser Oil Pump Error" and "Color LaserWriter 12/600 PS: Reducing Oil on Paper."

Article Change History:

23 Oct 1996 - Added Color LaserWriter 12/660 PS information.

28 Jun 1996 - Revised cleaning instructions.

Color LaserWriter 12/600: No Support for Envelopes (8/95)

Revised: 8/18/95
Security: Everyone

Color LaserWriter 12/600: No Support for Envelopes (8/95)

Article Created: 18 August 1995

TOPIC -----

Can I print envelopes on my Color LaserWriter 12/600 PS printer?

DISCUSSION -----

Apple does not support the printing of envelopes or labels on the Color LaserWriter 12/600 PS printer. On page 203 of the Color LaserWriter 12/600 PS User's Guide, it states that doing so could cause damage to the printer.

Printing Envelopes with Laserwriters (8/95)

Revised: 8/18/95
Security: Everyone

Printing Envelopes with Laserwriters (8/95)

=====

Article Created: 18 August 1995

TOPIC -----

The following article discusses the printing of envelopes on Apple's LaserWriter printers.

DISCUSSION -----

LaserWriter and LaserWriter Plus

Place the long, top edge of the envelope face up against the right side of the manual feed guide.

Personal LaserWriter 300, 320, 4/600 PS

Align the envelope along the left edge of the manual feed tray. Insert the envelope lengthwise, face up.

Personal LaserWriter NT, NTR, NTX, LS, SC

When using the cassette, move paper guide in from the 8-1/2 x 11 inch position. The cassette can handle up to 15 envelopes. Insert the envelopes face up. When using the manual feed, adjust the guide on the manual feed tray so the envelope will feed on the right side of tray. Insert the paper lengthwise, face up.

LaserWriter II

For all LaserWriter II printers, use the manual feed guides to adjust to the size of the envelope. The guides will center envelopes in the manual feed tray. Insert the envelope lengthwise, face up. An optional envelope feeder is available.

LaserWriter Selects

Use the guides to center the envelope on the manual feed tray. Insert envelope

lengthwise, face down.

LaserWriter Pro 600, 630

Adjust guide on the multipurpose tray to fit the envelope. Insert the envelope lengthwise, face up. The envelope will feed on the left side of the tray. An optional envelope feeder is available.

LaserWriter Pro 810

Adjust guides on multipurpose tray (located on the back of the printer) to fit the envelope. Insert paper lengthwise, face up. A Power Feeder, which can feed envelopes, is available.

LaserWriter 16/600PS

Adjust guide on the multipurpose tray to fit envelope. Insert envelope lengthwise, face up. The envelope will feed on the left side of tray. An optional envelope feeder is available.

Color LaserWriter 12/600PS

Use of envelopes are not supported on this printer.

Macintosh PowerBook 5300ce/117: Description (4/97)

Article Created: 21 August 1995
Article Reviewed/Updated: 2 May 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 5300ce/117 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook 5300ce/117 provides the high performance of PowerPC processor technology and long battery life in the highest-quality, highest-resolution, color PowerBook system available. Its exceptional power, 32 megabytes of memory, high-capacity 1.1-gigabyte, hard disk drive, and advanced SVGA display capability make it the ultimate PowerBook.

Featuring an advanced 117-megahertz PowerPC 603e processor, this PowerBook lets mobile users experience the true power of desktop computing—all in a system that weighs only 6.2 pounds. It provides 16-bit, CD-quality stereo sound, and its large, active-matrix, SVGA display supports thousands of bright, vivid colors and provides 800 by 600 resolution—a larger viewing area than that of standard displays. And the power of its RISC processor not only lets the PowerBook 5300ce/117 handle the most complex tasks easily, but also enables it to run Insignia Solutions SoftWindows emulation software for DOS and Windows compatibility.

Already powerful, the PowerBook 5300ce/117 is designed to make expansion easy. You can expand the memory to 64 megabytes. The PowerBook 5300ce/117 also features two PC Card slots for additional functionality as well as an expansion bay for third-party solutions -- the floppy disk drive can be removed and replaced with an additional hard disk drive, magneto-optical storage device, or internal AC adapter.

Because communication is so vital to mobile users, the PowerBook 5300ce/117 offers a range of networking and communications options. It features built-in infrared technology for easy file sharing without cable connections or time-consuming setup. Through its PC Card slots, you can add a wired or wireless modem, storage, or Ethernet networking capability.

With its unprecedented power, advanced features, advanced SVGA display, and expandability, the PowerBook 5300ce/117 is truly the answer for mobile users who require high performance for complex tasks and brilliant graphics in a system that can accompany them wherever they go.

Features

=====

Performance

- Uses a 117-MHz PowerPC 603e processor
- Includes a high-capacity internal 1.1 GB hard disk drive
- Runs thousands of Mac OS applications and hundreds of applications optimized for Power Macintosh

Innovative Design

- Provides a 10.4-inch (diagonal), backlit, active-matrix, SVGA color display with thousands of colors
- Features PC Card slots and an expansion bay, for flexibility and expandability
- Comes with an integrated Apple trackpad, full-size keyboard, and integrated palm rest
- Uses a long-lasting Nickel-Metal-Hydrate battery

Easy And Versatile Communications Capabilities

- Provides built-in infrared technology for easy file sharing—no cables necessary
- Lets you add a wired or wireless modem or Ethernet networking capabilities through PC Card slots
- Comes with a range of communications software to keep you connected

Multimedia Support

- Comes with 8-bit color video-out, upgradable to greater bit depths
- Provides a built-in speaker; 16-bit, CD-quality stereo line input and sound output; and an integrated microphone
- Includes an expansion bay for removable, rewritable media such as a magneto-optical drive
- Includes QuickTime software

Preinstalled Software

- Comes with System 7.5
- Provides active assistance in learning new features through Apple Guide

..TIL18433-Macintosh_PowerBook_5300ce-117-Description_4-97_(TA34302).pdf

- Comes with the PowerBook Mobility Bundle, software designed to enhance mobile computing

Bundled Software

Each configuration comes with the PowerBook Mobility Bundle. The Bundle includes the following components:

- PowerTalk 1.0
- Macintosh PC Exchange
- Macintosh Easy Open
- Apple Remote Access
- PowerBook Control Strip
- Floppy Disk Maker
- Disk Image Mounter
- Password Protection Software
- Eric's Ultimate Solitaire Sample
- Spin Doctor
- Super Maze Wars
- PowerBook Demo

What's In The Box

The following components are expected to be included in the box with all Macintosh PowerBook 5300 computers:

- Macintosh PowerBook 5300 computer
- Macintosh PowerBook 5300 User's Guide
- Macintosh PowerBook 5300 Technical Specifications sheet
- ARA Client User's Guide
- ARA Promotion Flyer
- Registration card
- Packing List
- Disk Tools diskette
- Power Cord
- AC adapter
- Protective Battery Cap/Cover
- Expansion Bay PC Card Storage Module
- Resource Guide including
 - Warranty
 - Software License Agreements
 - Apple logo decals
 - Citibank VISA Brochure and Application
 - Tote Bag Catalog

Ordering Information

=====

PowerBook 5300ce/117 32 MB/1.1 GB

• PowerBook 5300ce/117 computer with 32 MB of RAM, built-in 1.4 MB Apple SuperDrive, and internal 1.1 GB hard disk drive, Nickel-Metal-Hydride battery and AC adapter, PC Card storage tray, System software version 7.5.2, PowerBook

Macintosh PowerBook 5300ce/117:Technical Specifications (8/96)

Article Created: 21 August 1995
Article Reviewed/Updated: 1 August 1996

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook 5300ce/117 computer.

DISCUSSION -----

Microprocessor

- 117-MHz PowerPC 603e

Memory

- 32 MB of RAM, expandable to 64 MB
(Note: 16 MB is soldered to the logic board. The other 16 MB is in the one RAM card expansion slot.)

Storage

- Built-in removable Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal 1.1 GB hard disk drive
- Expansion bay for third-party solutions such as an additional hard disk drive or magneto-optical drive (PC Card storage tray included in box may be inserted into this bay to reduce weight by 0.4 lb.)

Display

- 10.4-in. (diagonal), backlit, active-matrix, SVGA color display
- Resolution: 800 by 600 pixels with thousands of colors; 800 by 600 resolution (SVGA) provides a larger viewing area than standard 640 by 480 displays. This means you see more spreadsheet columns, text, and

graphics

- Black matrix screen reduces glare, clearly defines colors, and improves contrast

Battery

- Nickel-Metal-Hydride battery provides 2.5 - 4 hours of use before recharge
- Battery recharges in 2 hours while computer is shut down or in sleep mode; 4 hours while running
- PowerBook Control Strip lets you monitor time remaining, charge status, and battery usage

PC Card slots (PCMCIA)

- Two PC Card slots that can accommodate two Type I or II PC Cards or one Type III PC Card
- Lets you add industry-standard cards such as Ethernet networking, a wired or wireless modem, storage, or other capabilities

Expansion bay

- IDE connector for third-party solutions such as an additional hard drive, a magneto-optical drive, and other devices
- Power lines for connection of an internal AC adapter and other third-party solutions

Ports

- One Apple Desktop Bus (ADB) port
- One serial (RS-422) port
- One SCSI port for connecting as many as six external devices (including CD-ROM)
- One power adapter port
- Stereo sound input port
- Stereo sound output port
- Video output port

Networking

- Serial/LocalTalk port for AppleTalk connections to networks and printers
- Ethernet networking through PC Cards
- Ultra-easy file sharing through infrared technology—without cable connections or time-consuming setup; supports AppleTalk protocol

Built-in Stereo Sound

- 16-bit, CD-quality stereo sound capable of driving headphones or external speakers
- Built-in speaker and integrated microphone
- Digital-to-analog conversion sampled at 44.1, 22.05, or 11.025 kHz
- 16 bit, audio line-in for recording

Video Output

- 8-bit video output port to support external color displays—compatible with most Apple, VGA, and SVGA monitors (upgradable to greater bit depths through third-party solutions)

Security

- Includes a security slot that secures the system, battery, and expansion bay (requires a third- party accessory)
- Includes password protection software

Keyboard and Apple trackpad

- Built-in, full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys and integrated palm rest
- Power button on keyboard
- Solid-state Apple trackpad provides precise cursor control in response to the movement of the user's fingertip over its surface; sensing of movement and acceleration is easily adjustable through a control panel

Disability access

- System software includes CloseView and Easy Access, and provides the ability to substitute visual cue for beep

Electrical requirements

- Line voltage: 100 to 240 volts AC
- Frequency: 50 to 60 Hz

ADB power requirements

- Maximum current draw for all ADB devices: 200 mA

Environmental requirements

- Operating temperature: 41 degrees to 95 degrees F (5 degrees to 35 degrees C)
- Storage temperature: -13 degrees to 140 degrees F (-25 degrees to 60 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Size and weight

- Height: 2.2 in. (5.3 cm)
- Width: 11.5 in. (29.2 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 6.2 lb. (2.8 kg)

Macintosh PowerBook 5300cs/100: Description (Discontinued)

=====

Article Created: 21 August 1995
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 5300cs/100 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook 5300cs/100 provides the performance of PowerPC technology and long battery life in an affordable color notebook system. It is a versatile system, suitable for everything from word processing to desktop publishing.

Featuring an advanced 100-megahertz PowerPC 603e processor, the PowerBook 5300cs/100 lets mobile users experience the true power of desktop computing—all in a system that weighs only 6.2 pounds. It provides 16-bit, CD-quality stereo sound, and its full-page-width, dual-scan display supports 256 bright, vivid colors. It also comes with 8-bit color video-out to support external displays. And the power of its RISC processor not only lets the PowerBook 5300cs/100 handle the most complex tasks easily, but also enables it to run Insignia Solutions SoftWindows emulation software for DOS and Windows compatibility.

Already powerful, the PowerBook 5300cs/100 is designed to make expansion easy. You can expand the memory to 64 megabytes, or opt for an active-matrix display. The PowerBook 5300cs/100 also features two PC Card slots as well as an expansion bay for third-party solutions—the floppy disk drive can be removed and replaced with an additional hard disk drive, magneto-optical storage device, or internal AC adapter.

Because communication is so vital to mobile users, the PowerBook 5300cs/100 offers a range of networking and communications options. It features built-in

infrared technology for easy file sharing without cable connections or time-consuming set-up. Through its PC Card slots, you can add a wired or wireless modem, storage, or Ethernet networking capability.

So if you are looking for an affordable color notebook system with power to spare, look no further than the PowerBook 5300cs/100.

Features

- PowerBook Demo

What's In The Box

The following components are expected to be included in the box with all Macintosh PowerBook 5300 computers:

- Macintosh PowerBook 5300 computer
- Macintosh PowerBook 5300 User's Guide
- Macintosh PowerBook 5300 Technical Specifications sheet
- ARA Client User's Guide
- ARA Promotion Flyer
- Registration card
- Packing List
- Disk Tools diskette
- Power Cord
- AC adapter
- Protective Battery Cap/Cover
- Expansion Bay PC Card Storage Module
- Resource Guide including
 - Warranty
 - Software License Agreements
 - Apple logo decals
 - Citibank VISA Brochure and Application
 - Tote Bag Catalog

Ordering Information

PowerBook PowerPC Upgrades: Descriptions & Specifications (1/96)

Revised: 10/1/96
Security: Everyone

PowerBook PowerPC Upgrades: Descriptions & Specifications (1/96)

=====

Article Created: 21 August 1995
Article Reviewed/Updated: 30 January 1996

TOPIC -----

This article contains descriptions and technical specifications for the Macintosh PowerBook PowerPC upgrades.

DISCUSSION -----

Overview
=====

If you're a Macintosh PowerBook owner who wants the advanced capabilities of RISC-based PowerPC processor technology, without sacrificing your previous PowerBook investments, you can upgrade to PowerPC performance. Upgrade kits are now available for many PowerBook and all PowerBook Duo systems. These kits provide the high performance of today's PowerPC processor-based PowerBook computers.

The Macintosh PowerBook Processor Card Upgrade Kit for PowerBook 500 series computers includes 8 megabytes of memory and the advanced PowerPC 603e processor running at 100-megahertz.

For the PowerBook Duo systems as well as for the PowerBook 190 series, the path to PowerPC performance is a complete logic board upgrade. This upgrade also includes 8 megabytes of memory and the advanced PowerPC 603e processor running at 100-megahertz.

These PowerPC upgrades give your computer processor performance equivalent to that of the PowerBook Duo 2300c/100 or the PowerBook 5300c/100.

Installation of either upgrade must be performed by an authorized Apple service provider. Your upgraded computer will retain your existing display, hard disk drive, modem, and memory expansion cards. In addition, the most recent version of the Mac OS—the Macintosh operating system—will be installed on your

computer's hard disk drive.

No matter which upgrade is appropriate for you, your system can continue to use existing accessories such as power adapters, modems, batteries, memory expansion, and docking products. Along with hardware compatibility, you'll also have complete software compatibility: the high performance of the PowerPC processor will enable you to run your existing Macintosh applications, applications optimized for Power Macintosh, and with Insignia Solutions SoftWindows emulation software, even applications for DOS and Windows.

The entire family of upgrades gives you PowerPC processor-based capabilities designed for the future, built on the foundation of the investment you have in your PowerBook today.

PowerPC Upgrade Features

=====

Power And Speed

- Includes PowerPC 603e processor with floating-point coprocessor
- Enables your PowerBook computer to run from two to four times faster than previous PowerBook systems

Compatibility

- Runs hundreds of applications optimized for Power Macintosh
- Runs thousands of existing Mac OS applications
- Runs DOS and Windows applications using Insignia Solutions SoftWindows software

Memory

- Retains existing RAM upgrade cards

Models Upgradable Through Logic Board

- PowerBook 190/66 and 190cs/66
- PowerBook Duo 210, 230, 250, 270c, 280, 280c (all PowerBook Duo systems)

Models Upgradable Through Processor Card

- PowerBook 520, 520c, 540, and 540c

Technical Specifications

=====

PowerBook Duo 200 Series

Macintosh PowerBook Logic Board Upgrade Kit with PowerPC 603e for PowerBook Duo 200 series

- Microprocessor: 100-MHz PowerPC 603e
- Memory: 8 MB of RAM, expandable to 56 MB (existing RAM cards are compatible)
- ROM: 4 MB of ROM (includes emulator)
- ASIC: Bus ASIC from 603e bus to 68030 bus
- Type of upgrade: Logic board
- Installation: Must be installed by an authorized Apple service provider

PowerBook 190 Series

Macintosh PowerBook Logic Board Upgrade Kit with PowerPC 603e for PowerBook 190 series

- Microprocessor: 100-MHz PowerPC 603e
- Memory: 8 MB of RAM, expandable to 40 MB (existing RAM cards are compatible)
- ROM: 4 MB of ROM (includes emulator)
- ASIC: Bus ASIC from 603e bus to 68030 bus
- Type of upgrade: Logic board
- Installation: Must be installed by an authorized Apple service provider

PowerBook 500 Series

Macintosh PowerBook Processor Card Upgrade Kit with PowerPC 603e for PowerBook 500 series

- Microprocessor: 100-MHz PowerPC 603e
- Memory: 8 MB of RAM, expandable to 40 MB (existing RAM cards are compatible)
- ROM: 4 MB of ROM (includes emulator)
- ASIC: Bus ASIC from 603e bus to 68030 bus
- Type of upgrade: Processor card
- Installation: Must be installed by an authorized Apple service provider

(Note: Your PowerPC upgraded PowerBook, for any of the upgrades mentioned here, will retain its original display and hard disk drive.)

Ordering Information

=====

PowerBook Duo 200 series

Macintosh PowerBook Logic Board Upgrade Kit with PowerPC 603e for PowerBook Duo 200 series

- Logic board with 100-MHz PowerPC 603e, 8 MB of RAM, 4 MB of ROM, bus ASIC, and System 7.5.2 installed on the hard disk drive
- Order No. M3171LL/A

PowerBook 190 series

Macintosh PowerBook Logic Board Upgrade Kit with PowerPC 603e for PowerBook 190 series

- Logic board with 100-MHz PowerPC 603e, 8 MB of RAM, 4 MB of ROM, bus ASIC, and System 7.5.2 installed on the hard disk drive
- Order No. M3881LL/A

PowerBook 500 series

Macintosh PowerBook Processor Card Upgrade Kit with PowerPC 603e for PowerBook 500 series

- Processor card with 100-MHz PowerPC 603e, 8 MB of RAM, 4 MB of ROM, bus ASIC, and System 7.5.2 installed on the hard disk drive
- Order No. M3081LL/A

Apple MessagePad: Password Reset or Removal (8/95)

Revised: 8/21/95
Security: Everyone

Apple MessagePad: Password Reset or Removal (8/95)

=====

Article Created: 21 August 1995

TOPIC -----

I forgot my Newton password. Is there a way to reset or remove the password?

DISCUSSION -----

The user's guide for earlier versions of the Apple MessagePad stated that the MessagePad could be sent in for service to have the password removed. That is incorrect. There is no supported method for removing or resetting the password and preserving the data and user settings on Apple MessagePads.

The following method, called a hard reset, will remove the password, but will also result in the loss of all user's data and settings:

Step 1

Press and hold down the power switch.

Step 2

Press the reset switch inside the battery compartment.

Step 3

When a warning dialog is presented on the screen, release the power switch.

Step 4

Follow instructions presented by the warning dialog.

All data and user settings, including the password, will be erased. Any System Update installed is NOT erased.

..TIL18439-Apple_MessagePad-Password_Reset_or_Removal_8-95.pdf

For more information, on other reset procedures see "Apple MessagePad: Different Types of Reset" and "Apple MessagePad: How to Reset."

Macintosh PowerBook 190/66: Description (04/97)

Revised: 4/3/97
Security: Everyone

Macintosh PowerBook 190/66: Description (04/97)

Article Created: 21 August 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 190/66 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook 190/66 is the most affordable PowerBook computer, combining the performance of the Motorola 68LC040 processor with the convenience of a compact, light-weight notebook computer. It offers a host of enhanced features, including PC Card slots, an expansion bay, a full-size keyboard, an improved Apple trackpad for increased functionality, and a number of upgrade options.

Featuring an innovative design, the PowerBook 190/66 is both expandable and flexible. It provides an expansion bay for third-party peripherals—the floppy disk drive can be removed and replaced with an additional storage device or an internal AC adapter. Through its PC Card slots, you can add a wired or wireless modem, storage, Ethernet networking, or any of a host of capabilities.

To get you started working right away, the PowerBook 190/66 comes bundled with ClarisWorks integrated productivity software. ClarisWorks combines word processing, spreadsheet, database, graphics, and communications capabilities. In addition, with your PowerBook 190/66, you will receive the PowerBook Mobility Bundle, a preinstalled collection of software that meets the needs of mobile users in the areas of communications, compatibility, power management, security, file transfer, and even entertainment.

Already a powerful and complete system, the PowerBook 190/66 is designed to grow in capabilities as your needs change. If your tasks demand higher performance, you can upgrade your system to PowerPC RISC technology. You can improve the

display capability by upgrading to an active-matrix screen (requires PowerPC upgrade). And you can opt to add infrared technology for easy file sharing, as well as color video-out.

So if you want an affordable, highly capable notebook computer that can take you into the future, the PowerBook 190/66 is the perfect choice.

Features

=====

Innovative New Design

- Uses a 66/33-MHz 68LC040 processor
- Provides a 9.5-in. (diagonal), backlit, passive-matrix, gray-scale display with 16 levels of gray
- Includes a high-capacity internal 500 MB hard disk drive
- Offers stereo sound output capable of driving headphones or external speakers
- Comes with built-in serial and SCSI ports
- Features an improved Apple trackpad for increased functionality, full-size keyboard and integrated palm rest

Expandability

- Includes PC Card slots for two Type I or II PC Cards or one Type III PC Card
- Features an expansion bay for third-party solutions, such as a second hard disk drive, magneto-optical drive, or internal AC adapter

A Complete Solution

- Includes everything you need to be productive -- right out of the box
- Comes with ClarisWorks productivity software
- Includes the PowerBook Mobility Bundle, software designed to enhance mobile computing
- Comes with System 7.5
- Provides active assistance in learning new features through Apple Guide
- Can be upgraded to take advantage of PowerPC processor technology
- Can be upgraded to feature an active-matrix display (requires PowerPC upgrade)
- Can be upgraded to provide easy file sharing through infrared technology
- Can be upgraded to include color video-out capabilities

Bundled Software

=====

The Macintosh PowerBook 190 models ship with Macintosh System Software 7.5.2. Each configuration also comes with the PowerBook Mobility Bundle. The Bundle includes the following components:

PowerBook Mobility Bundle

- PowerTalk 1.0
- Macintosh PC Exchange
- Macintosh Easy Open
- Apple Remote Access
- PowerBook Control Strip
- Floppy Disk Maker
- Disk Image Mounter
- Password Protection Software
- Eric's Ultimate Solitaire Sample
- Spin Doctor
- Super Maze Wars
- PowerBook Demo

Other Third-Party Software

Macintosh PowerBook 190 computers also ship with ClarisWorks 4.0.

What's In The Box

=====

The following components are expected to be included in the box with all Macintosh PowerBook 5300 computers:

- Macintosh PowerBook 190 computer
- Macintosh PowerBook 190 User's Guide
- Macintosh PowerBook 190 Technical Specifications sheet
- ARA Client User's Guide
- ARA Promotion Flyer
- Registration card
- Packing List
- Disk Tools diskette
- Power Cord
- AC adapter
- Protective Battery Cap/Cover
- Resource Guide including
 - Warranty
 - Software License Agreements
 - Apple logo decals
 - Citibank VISA Brochure and Application
 - Tote Bag Catalog
- ClarisWorks 4 Manual

Macintosh: Cross-Platform Client/Server Solutions (1 of 2) 4/97

Revised: 4/3/97
Security: Everyone

Macintosh: Cross-Platform Client/Server Solutions (1 of 2) 4/97

Article Created: 21 August 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article contains the Apple World-Wide Market Development Position Paper titled "Cross-Platform Development Tools and Client/Server Solutions Update for Apple Computer's Macintosh." This is part 1 of 2, of version 2.51 of the document.

DISCUSSION -----

Purpose of this Position Paper

This is a working document and it is designed to:

- update Apple Computer's technical field and corporate personnel on the Market Development team's continuing efforts to evangelize important Macintosh-based development tools,
- provide summary information about some of the most frequently asked for tools and solutions, and
- wrap this information in an easily deliverable context; i.e., provide compelling marketing information that helps our customers understand the importance we place on application development technologies.

Because this document provides a summary and assumes a technical audience, no background information is included in each specific section. Rather, the goal of this paper is to update an individual's selected knowledge of a particular technology, tool, or solution. To that end, delivery dates, contact names, and pointers to additional information are provided.

Lastly, this paper does not describe Apple's development tools strategy; rather, its main purpose is to provide information about Apple's actions (successes and pursuits) with regard to development tools. AppleSoft's core tools group has

completed the necessary business planning and discussion in crafting its "Tools Strategy". For more information on the overall tools strategy, contact AppleSoft Developer Tools Product Marketing.

For additional background and information about related client/server and application development tools and topics, consult the following documents:

"Guide to Macintosh Development Tools" Apple Computer, Inc. 1995

Acknowledgements

=====

Apple WW (World-Wide) Market Development gratefully acknowledges the input and information provided by many areas of Apple, including AppleSoft, Apple Business Systems, and Personal Interactive Electronics in the crafting of this document. Additionally, all of the software providers listed here have delivered product information and input to help position products correctly.

Apple® is absolutely committed to both building its own cross-platform development tools as well as encouraging and supporting third-parties that endeavor to create (Macintosh-based) cross-platform tools. This commitment is supported by five major actions within Apple's product (AppleSoft & Apple Business Systems) and marketing divisions (Apple USA Market Development). These five actions are each discussed separately.

1) A commitment to industry standard APIs & technologies

=====

ODBC v2.1

Apple supports the ODBC client access API as part of its system software offering. Apple has built the Macintosh ODBC client component (driver-manager)

in cooperation with Microsoft and Visigenic. The result of this arrangement is direct Macintosh application access of SQL-based data using the ODBC API. ODBC 2.0 was created for Apple Computer by Visigenic Software, Inc. and features full ODBC 2.1 compatibility, native Power Macintosh performance, and other features such as a cursor library for easier application programming. Any application which utilizes ODBC access may include Apple's driver manager to enable a connectivity solution. The complete ODBC SDK is available via Apple's World Wide Web Server (at apple.com) and on Apple's Mac OS SDK. Re-distribution of the ODBC driver manager is royalty-free. Alternatively, Intersolv provides an ODBC solution for the Macintosh (as well as Windows, OS/2, Unix, and Win NT) that delivers a common cross-platform implementation of this data access API.

DAL

Apple's DAL technology has been licensed to Independence Technologies, Inc. ITI has capably updated, maintained, and improved both the DAL client software as well as many DAL servers. Further, ITI has moved this middleware API to the Windows world - with full support for a Windows client. With a large number of back-end host environments supported, DAL has the strength to serve enterprise customers. ITI is shipping ODBC support for the Mac / DAL client (with its DAL v1.5 product).

MAPI and Microsoft Information Exchange

Apple will support Microsoft's Messaging API through its PowerTalk client and PowerShare server software for Macintosh. Further, an agreement with Microsoft will provide Macintosh messaging and directory service support for Microsoft's Information Exchange. The resulting solution will provide PowerTalk (mail) access to Microsoft mail directories and clients as well as mail-enabled (MAPI) Macintosh applications. MAPI and MIE support for PowerTalk/ PowerShare will be available shortly after Microsoft releases its Information Exchange product.

OLE 2.0 & OpenDoc

Apple's support of the cross-platform component software model, called OpenDoc, enables complete interoperability with Microsoft's OLE 2.0. As part of its commitment to Component Integration Laboratories (the owners of OpenDoc), Apple will deliver OpenDoc functionality for the Macintosh, while WordPerfect will provide OpenDoc for Windows and IBM will deliver OpenDoc for OS/2 and A/IX. Also, major Unix vendors are interested in providing OpenDoc support for their respective environments. Such broad cross-platform support will provide an open standard while delivering a functional superset of OLE 2.0 on the Macintosh.

Further, OpenDoc will enable a new breed of cross-platform software, called components or parts. OpenDoc parts that are created on a Macintosh can be used on a Windows, OS/2 or Unix platform (and vice versa). Also, OpenDoc parts can be shared and mixed with OLE parts. This fundamental layer of cross-platform code is vital to Apple's on-going enterprise strategy.

Status: Apple, WordPerfect, and IBM have each shipped several early SDKs (to developers) for their respective environments (Macintosh, Windows, and OS/2).

IBM's CICS

Apple's alliance with IBM has yielded many products during the last several years. IBM's Transaction Systems group is currently shipping Mac CICS - a client API set for Macintosh that enables Mac application support of host-based CICS applications. Using this API, CICS access will be delivered from within an application or solution. CICS is currently being "repositioned" by IBM as significant technology for developing and deploying truly distributed computing applications. The Mac version of CICS support will propel the Macintosh further into mission-critical client/server applications in the enterprise.

OSF's DCE (Distributed Computing Environment)

Apple is committed to ensuring availability of DCE functionality on the Macintosh platform. By adhering to this (emerging) industry standard API set, Apple expects increased consideration in many markets, especially those that emphasize open systems standards. Apple is currently establishing the necessary partnerships (with appropriate third-party developers) to provide a complete and native DCE Macintosh client offering. Through such relationships, the Macintosh can act as a robust platform for collaborative computing in needing enterprises.

Novell's Tuxedo

A prevalent transaction handler for Unix-based applications, Novell's Tuxedo API is currently shipping for Macintosh. Application developers, then, may access this transaction processing facility from within a Macintosh-based application. For more information on Novell's Tuxedo, contact Novell at 1-800-277-2717.

2) Active Evangelism of Third-Party, Cross-Platform Tools Suppliers

=====

Apple has been and continues to be very successful in its evangelism of industry-leading, cross-platform application development tools providers. Many strong tools are either shipping or about to ship in every major category. Many representative (i.e., most frequently asked for) tools are listed below, although this is not an exhaustive list in each category.

Legend:

Status Term	Meaning
-----	-----
In Development	The ISV has committed to Mac version; code is being actively ported and / or developed. Average development timeframe = 15 - 18 mos.
Negotiation	Both Apple and the ISV have agreed that a Macintosh version is of some priority; the two entities are currently discussing funding, resources, project timelines, market implications, and so on.
Investigation	Both Apple and the ISV have agreed to discuss the

development of a Mac version; however, insufficient progress has been made to form a commitment to development, timeline, and so on.

Note:

Any references to ship date are expressed in Apple fiscal quarters.

Overview

=====

This section lists, by category, many cross-platform application development tools that are hosted on Apple Computer's Macintosh. All tools support at least the 32-bit Macintosh API and the Windows API (some only support Win16 today - but they are migrating to Win32). Many tools also provide support for OS/2 and some provide support for various Unix environments (such as Motif) and (where appropriate) mainstream character cell terminal sessions. In order to determine the details of which client platforms are supported by a specific tool, we recommend contacting the appropriate vendors directly.

The languages supported varies by category; therefore, we've taken the time to define and overview each category to provide a context and technical orientation for the reader. For example, most workgroup-level client/server tools are interpreted (or p-code-based) 4GLs; therefore, they do not support C or C++ natively. Rather, they may support 3GL extension mechanisms (such as dynamic libraries), but do not reduce to a compiled language (3GL) environment.

Also, the DBMS support (or RDBMS) varies by category and tool. Each tool supports at least one native RPC-based SQL access mechanism (Oracle's SQL*Net and Sybase OpenClient in particular) and ODBC. Many tools offer a fairly broad array of connection mechanisms - from standard SQL tools to transaction-based middleware (e.g., Novell's Tuxedo) and DCE-like RPCs. Because the primary focus of this tools listing is client/server data access, Oracle and Sybase DBMS (at least) and ODBC support is presumed.

Lastly, this is not an exhaustive list of available Mac-based tools; instead, it is representative of the types of industry-leading tools in each category. The goal of this document is to suggest that the Macintosh supports (essentially) all leading tools by leading tools vendors. In fact, the best of breed tools offer cross-platform Macintosh support (or they will in the very near future).

WorkGroup Client/Server

Definition: tools that are highly visually-oriented, 4GL-based, and most capable of creating application logic that resides on the client computer. Workgroup level tools are optimal for creating workgroup (or departmental) applications that access and utilize structured (relational) data using structured query language (SQL). Most commonly, workgroup tools are used in a two-tier design - although this is changing as these tools mature. Many of these tools, for instance Powersoft, Gupta, and Oracle have significant features that nearly place them in the "enterprise c/s" category (next). In the future, the tool leaders from this category will, ultimately, scale their tools up to this new level; consequently, some tools/products are transcending the two categories.

Company Name -----	Status -----	Contact / Phone # -----
Powersoft's PowerBuilder	Shipping Fall '95	508-287-1900
Blyth's Omnis 73	Shipping	Lisa Borreani / 415-286-3541
Uniface Five	Shipping	510-748-6145
Gupta SQL Windows for Mac	In Development	Berman.D / X4-2285
Oracle Forms & Report	Shipping (v 3.X)	800-ORACLE1
ACI 4D Passport *	Shipping	408-252-4444

* ACI will release a Windows version of Passport in mid '95

Enterprise Client/Server or Client/Server "OLTP"

Definition: these tools provide highly scalable, transaction-oriented application development. Further, enterprise-class tools support advanced software engineering concepts such as: object repositories, team building capabilities, version/change management, integrated transaction processing handlers (either built-in or via partnership with middleware providers), model-driven construction, and application (logic) partitioning. Such advanced features result in applications that are (potentially) highly scalable and a development environment that is commercial quality (professional). For constructing true, multi-tier, transaction-based applications, these environments are superior to other categories. Also, many of these tools compile into a standard 3GL (such as C or C++) for final execution, which provides additional refinement and control.

Company Name -----	Status -----	Contact / Phone # -----
Forté Development Environment	Shipping	ed@forte.com/ 510-869-3400

Notes:

*Dynasty includes Neuron's tools with its offering

** Unify's product is currently capable of generating Macintosh client code, but the Power Mac-based development environment will ship during late Summer '95.

Visual Programming & Rapid Application Development*

Definition: these tools could easily be placed in the Workgroup client/server category - but we've separated them into this category because their distinguishing feature is the highly visual metaphor on which they are based. With these tools, the developer almost literally "paints" the application through a visual, forms-based metaphor. Such an elegant tool typically has some high level language at its core. For instance, Oracle Power Objects is based on the BASIC syntax and is (in many ways) compatible with Microsoft's Visual Basic. Each of these tools is likely to support the OpenDoc component software architecture standard by mid calendar 1996.

Company Name	Status	Contact / Phone #
Oracle Power Objects	Ship Q4 '95	Berman.D/X4-2285
Pictorious Peregrine **	Shipping (APDA)	902-455-4446/ 800-927-4847
Novell's AppWare v1.2	Shipping	800-277-2717

Notes:

* Each of these tool sets provide SQL data access in addition to a robust, visual environment

** Formerly Prograph, Pictorious is targeting its Windows version for mid-1995

Object-Oriented Frameworks - C & C++

Definition: A framework is a set of closely related class libraries and predefined methods for working with the class libraries. These commercial quality C & C++ frameworks are commonly used for commercial application development. Because of their (relative) cross-platform maturity, some (XVT, for instance) have also found favor in the in-house developer and SI/VAR communities. More recently, these tool providers have improved the development environment (visually-oriented now) on top of these abstracted class libraries. Although different in their cross-platform approach, both XVT and Visix have strong followings and impressive capabilities.

Company Name	Status	Contact / Phone #
Visix Galaxy (68K Shipping)	PPC Ship Q4'95	703-758-2707
XVT	Shipping (APDA)	303-443-4223 / 800-678-7988
ICE, Inc. OM++	Shipping	415-931-9400

Object Oriented Frameworks - SmallTalk

Overview: A framework is a set of closely related class libraries and predefined methods for working with the class libraries. The dominant SmallTalk vendors, Digitalk and Parc Place, have recently begun merger (during Summer '95). The result is tremendous consolidation of the tightly controlled SmallTalk marketplace. The cross-platform nature of this dynamic language environment, though, is both proven and mature. Arguably, Parc Place has the most complete Macintosh implementation (of the two major vendors) with Power Mac-native support. However, Quasar Knowledge Systems (QKS) has a very strong framework environment, technically, with its SmallTalk Agents.

Company Name	Status	Contact / Phone #
-----	-----	-----
Digitalk's SmallTalk	Shipping (APDA)	714-513-3000
ParcPlace's VisualWorks (68K & PPC)	Shipping	Curtis Muir / 415-691-6700
QKS - SmallTalk Agents	Shipping	301-530-4853

Integrated CASE tools

Overview: Integrated (sometimes called "Enterprise CASE") CASE tools offer at least some large percentage of the software design engineering life cycle: from business rule development and application modeling to coding and code generation, documentation, version control, and maintenance. These tools offer much of the capability of some earlier described tools (such as workgroup client/server), plus some percentage of the "enterprise CASE life cycle.

Company Name	Status	Contact / Phone #
-----	-----	-----
Texas Instrument's Composer - IEF	Negotiation	Berman.D / X4-2285
Oracle Designer/2000*	In Development	Berman.D / X4-2285
Sybase (DEFT)	Shipping	800-8SYBASE
Computer Sys Advisers' Silverrun	Shipping	202-391-6500
Software AG's Natural Architect	Shipping	703-391-6576
Iconix PowerTools	Shipping	310-458-0092
Excel's MacAnalyst&MacDesigner	Shipping	515-752-5359

Notes:

* Oracle's CASE product will be capable of generating Macintosh client code (i.e., Oracle Forms v4.5 code), although the development environment is not hosted on Macintosh.

CASE "Bridge" Tools

(for TI IEF repository access from other development tools)

Overview: For developers who are interested in Texas Instruments IEF (for Composer) support, Apple recommends these two "bridge" tools. These "bridge" products provide IEF object (code) repository access from within a native Macintosh C/S tool (Powersoft PowerBuilder support from MidCore and Uniface support from Office Information Systems). Obviously, MidCore's tool will be most useful once Powersoft ships PowerBuilder for Macintosh (see the category description of Workgroup level tools for more info on Powersoft and Uniface). The goal of these bridge tools is to make productive use of the objects and class code (generated by the TI's CASE facility) in a Macintosh-based development environment.

Company Name	Status	Contact / Phone #
-----	-----	-----
MidCore Software - PowerBuilder	Ship Q4 '95	Joe Vernale / 203-759-0906
Office Information Systems -Uniface Shipping		TI @ 800-336-5236

Decision Support Systems/Business Intelligence Tools

Overview: These are commonly referred to as tools for Business Intelligence, Executive Information Systems, On-Line Analytical Processing (OLAP), and so on. These techniques, essentially, describe a "hypercube" process where production data is moved into a data warehouse that is flexible and multi-dimensional (thus the term "hypercube"). The various tools, then, are used to construct managerial decision support applications that view, model, report, and pivot the data in new and interesting ways.

Company Name	Status	Contact / Phone #
-----	-----	-----
Planning Sciences, Inc.'s Gentium	Shipping	415-788-7651
Holistic Systems, Inc.'s Holos	Near shipping	303-790-7939
Andyne's Pablo	Shipping	613-548-4355
SAS Institute's JMP	Shipping	919-677-8166
SAS Institute's "SAS System v6.10"	Shipping	919-677-8166
Cognos PowerPlay	Shipping	613-738-1338

Host Program "Front-Ending" (with client/server capability)

Overview: This category, commonly called "screen scraping", represents tools that fall into the 1st generation client/server category - and has been a

natural addition to traditional character-based terminal emulation. The tools listed here have matured significantly during the last several years. Now, several of these tools can generate sufficient client application logic to effectively improve a legacy application's user-oriented behavior. Further, in situations where one of these tools is appropriate (mature, stable, and unchanging host application construction), certain amounts of mainframe MIPS can be saved by providing some local processing capability (instead of shipping everything back to the mainframe - for instance - mainframe application control characters can often be acted upon locally, without host intervention). Further, many of these tools (BlackSmith, Mozart, 5PM Pro, and Vicom) are native for Power Macintosh.

Company Name -----	Status -----	Contact / Phone # -----
Client Soft's ClientBuilder (formerly Both)	Shipping	914-631-5365
Mitem's MitemView	Shipping	415-323-6164

Mozart Systems	Shipping	415-340-1588
About Software 5 PM Pro	Shipping (APDA)	408-864-0694
Vicom Pro	Shipping	800-818-4266

Ad Hoc Query & Browse Tools -----

Definition/Overview: These tools are inherently end-user oriented, but may require some "set-up" by an MIS-type staff person. Such tools provide graphical representation of relational database tables for more simple query generation. Once done, the end user has (typically) data warehouse access, through a simple point-and-click interface, to vital corporate data (structured, relational). Various access techniques include views (on-screen), reports, and "canned" queries. Many of these tools are very mature and quite capable.

Company Name -----	Status -----	Contact / Phone # -----
Andyne's GQL	Shipping	613-548-4355
Business Objects	Shipping	408-973-9300

Client/Server "Solutions" / Applications & Groupware (Lotus Notes)

Overview: Additionally, Apple WorldWide Marketing's evangelism efforts include the growing number of client/server packaged solution providers. Such companies specialize in "horizontal" client/server markets, such as Human Resources / Financials / Manufacturing. Examples of shipping (or near shipping) solutions in these areas include:

Company Name	Status	Contact / Phone #
-----	-----	-----
SAP (America, Inc.) (68K & PPC)	Shipping	Dickens2 / X4-5510 800-USA-1SAP Ext.100
Cyborg Systems (HRMS)	Shipping	312-454-1865
Walker Interactive (Financials)	Near Shipping	415-495-8811

Macintosh: Cross-Platform Client/Server Solutions (2 of 2) 8/95

Revised: 8/21/95
Security: Everyone

Macintosh: Cross-Platform Client/Server Solutions (2 of 2) 8/95

=====

Article Created: 21 August 1995

TOPIC -----

This article contains the Apple World-Wide Market Development Position Paper titled "Cross-Platform Development Tools and Client/Server Solutions Update for Apple Computer's Macintosh." This is part 2 of 2, of version 2.51 of the document.

DISCUSSION -----

3) Apple Internal Efforts to Deliver Cross-Platform Tools

=====

Apple's (i.e., AppleSoft's) dedication to the cross-platform development tools arena has lead to two specific tactics:

- The re-sale of certain "best of breed" tools through Apple's Programmer & Developer Association (APDA) Catalog.
 - This ensures more widespread knowledge and use of some important tools
 - For more information, consult the APDA catalog or call APDA at 1-800-282-2732
- The funding of internal projects (within AppleSoft) to deliver (or help deliver) development tools of exceptional quality. Some primary examples include:

Dylan

A dynamic language and tool for object-oriented programming and development, Dylan's position in Apple's tool line is currently being recast to incorporate some important market-oriented features. Dylan is designed to create an environment that provides breakthrough improvement in object-oriented programming. The Dylan language is intended to co-exist with other object languages (such as C++), while providing an effective alternative. Cross-platform functionality is seen as an important capability for this tool.

Denali

This joint Apple-IBM project will deliver a high-level, cross-platform tool for solutions development and in-house programming. The environment will generate cross-platform OpenDoc parts (for Windows and Macintosh). Some planned features include a visual programming paradigm, HyperCard stack support, support for key middleware APIs (such as ODBC), some level of compatibility with Microsoft's Visual Basic (VBXs), user extensibility, and a scripting capability.

OpenDoc Development Framework (ODF)

Apple is combining the Bedrock and OpenDoc technologies to create the OpenDoc Development Framework (ODF), which will allow the creation of commercial-quality OpenDoc parts for both Macintosh and Windows with one development effort. Apple strongly recommends the use of the OpenDoc Development Framework for future development because it provides the increased productivity of a framework, full entry into the world of OpenDoc software, and cross-platform development capabilities. A developer release version of the OpenDoc Development Framework was given to attendees of the 1995 WWDC, and completed versions will be distributed through standard developer programs in late 1995.

Novell AppWare

Novell AppWare provides a visual programming interface to create applications based on existing AppWare Loadable Modules (ALMs) and v1.2 is currently shipping for Windows and the Macintosh. Novell plans to include full OpenDoc support in future versions of AppWare to allow the graphical creation of OpenDoc parts and containers. For more information on AppWare, contact Novell at 800-277-2717.

MacApp 3.5

Due in late 1995, this new version of MacApp will support OpenDoc (container support), PowerTalk mailers, and scripting. This version update underscores Apple's commitment to this long-preferred Macintosh development framework. The intent with v 3.5 is to extend the life of today's C++ MacApp source code while allowing developers to take the first step toward full support of component software technology (i.e., OpenDoc). MacApp 3.5 delivers a partial OpenDoc solution by creating a container that will support the embedding of commercially available OpenDoc parts. For full OpenDoc support, Apple recommends that, when it becomes available, OpenDoc Development Framework be used because it provides a truly cross-platform solution.

Apple Media Tool / Apple Media Tool Programming Environment

Through its visual programming language, this offering is well-suited to large-scale, multi-person development efforts (even with non-programmers). This tool is already being used by third-parties to create commercial CD-ROMs to generate both Macintosh and Windows products from the same project..

Script X

The first product of a joint (Apple & IBM) venture, Kaleida Laboratories, Script

X seeks to deliver a completely cross-platform media player and deployment vehicle for multimedia-based applications. Such a cross-platform tool should hasten the arrival and delivery of many cross-platform titles. Other companies will deliver the development environments within which Script X applications will be created.

Taligent CommonPoint
(formerly Taligent Application Environment or Tal A)

Apple plans to package Taligent technology with its own to provide customers with solutions that meet their needs. With its Copland operating system release, Apple will deploy the CommonPoint system on PowerPC-based computers. This will allow the CommonPoint system to run Macintosh and Taligent applications side-by-side. Also with Copland, Apple's first microkernel-based operating system, the ability to host Taligent Object Services on the microkernel exists. Additionally, Apple will begin to incorporate Taligent technologies into the Macintosh operating system, offering customers a choice of using the Taligent People, Places, and Things human interface along with the Macintosh user environment. Finally, Apple is actively working with Taligent to ensure interoperability between OpenDoc and Taligent technologies.

4) Dedicated Personnel to Improve Apple's On-Going Development Tools Position

=====

Several divisions of Apple Computer have active "evangelism" efforts, to help ensure the Macintosh platform is well-represented with development tools and client/server solutions providers:

These groups engage in a cross-divisional business planning process. Such planning will help ensure Apple derives maximum exposure and benefit from its overall evangelism efforts. Most importantly to Apple's enterprise customers, the Apple WorldWide Marketing team specifically tracks enterprise market requirements as the basis for its evangelism efforts. To that end, all field and customer input is welcome (in fact solicited) to ensure it is on the right track in its evangelism efforts. All customer feedback should be channeled through the customer's assigned Apple Account Executive.

5) Apple's Commitment to VITAL

=====

The IS (Information Services) community needs a truly open, vendor-independent architecture that allows customers to interconnect best-of-breed products in various categories to provide the greatest functionality and highest performance at the lowest possible cost. In addition to being open, the ideal IS architecture allows incremental deployment of new systems, enables rapid assimilation of new technology, and accommodates existing systems.

VITAL is an architecture for understanding, building, and implementing information systems. VITAL is open and vendor-neutral. VITAL addresses both new and legacy systems from microcomputer to mainframe. VITAL aims to provide

systems solutions that are based on client/server methods. Rather than specifying products, VITAL describes building blocks and associated functionality that can be implemented by means of hardware and software products that adhere to open systems standards. VITAL does not specify standards, but instead categorizes and indexes the functional characteristics that the standards implement. For example, VITAL describes types of middleware and when to use them, while standards specify OSF DCE or Novell Netware as implementations of middleware.

The VITAL framework is a conceptual model of client/server business computing described in terms easily understood by technicians, users, and executives. The objectives of the framework are to help IS organizations design systems that preserve legacy investments, provide access to operational data, balance system workloads, and reduce the cost of implementing systems.

For more information on VITAL, refer to the brochure entitled, A Technical Introduction to VITAL, An Architecture for Open Information Systems and/or the complete VITAL Technical Architecture Guideline (TAG) Documents. The TAG Documents are available through Apple's Programmer and Developer Association (APDA) at 1-800-282-APDA.

Apple's intent with VITAL includes:

- An internal commitment to the VITAL architecture as the mechanism in which it deploys client/server information systems,
- A commitment to linking its customers with highly knowledgeable and responsive consultants who can advise on the implementation of VITAL-ized systems. Such consultants can be found via the VITAL Consultant's Network. Information on VITAL-certified consultants can be found on the July 1994 APPLE CD-ROM.
- a commitment to disseminating solution / success stories of the VITAL architecture. MacIS will act as one focal point for disseminating the acceptance of VITAL.

Macintosh PowerBook 190/66:Technical Specifications (1/96)

Revised: 1/18/96
Security: Everyone

Macintosh PowerBook 190/66:Technical Specifications (1/96)

Article Created: 21 August 1995
Article Reviewed/Updated: 18 January 1996

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook 190/66 computer.

DISCUSSION -----

Microprocessor

- 66/33-MHz Motorola 68LC040

Memory

- 4 MB or 8 MB of RAM, expandable to 36 MB or 40 MB
[Note: The 4 MB or 8 MB (depending on the model) from Apple is soldered to the logic board. There is one RAM card expansion slot.]

Storage

- Built-in removable Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal 500 MB hard disk drive
- Expansion bay for third-party solutions such as an additional hard disk drive or magneto-optical drive

Display

- 9.5-in. (diagonal) backlit, passive-matrix display
- Resolution: 640 by 480 pixels with 16 levels of gray

PC Card slots (PCMCIA)

- Two PC Card slots that can accommodate two Type I or II PC Cards or one Type III PC Card
- Lets you add industry-standard PC Cards such as Ethernet networking, a wired or wireless modem, storage, or other capabilities

Expansion Bay

- IDE connector for third-party solutions such as an additional hard drive, a magneto-optical drive, and other devices
- Power lines for connection of an internal AC adapter and other third-party solutions

Battery

- Nickel-metal-hydride battery provides 2.5 to 4 hours of use before recharge
- Nickel-metal-hydride battery recharges in 2.5 hours while computer is shut down, in sleep mode, or running
- PowerBook Control Strip lets you monitor time remaining, charge status, and battery usage

Ports

- One Apple Desktop Bus (ADB) port
- One serial (RS-422) port
- One SCSI port for connecting as many as six external devices
- One power adapter port
- Stereo sound output port
- Video output port (optional)

Networking

- Serial/LocalTalk port for AppleTalk connections to networks and printers
- Ethernet networking through PC Cards
- Optional infrared technology allows for ultra-easy file sharing through infrared technology—without cable connections or time-consuming setup; supports AppleTalk protocol

Built-in Stereo Sound

- 16-bit, CD-quality stereo sound capable of driving headphones or external speakers
- Built-in speaker and integrated microphone

Security

- Includes a security slot that secures the system, battery, and expansion bay (requires a third-party accessory)
- Includes password protection software

Keyboard And Improved Apple Trackpad

- Built-in, full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys and integrated palm rest

- Power button on keyboard
- Solid-state improved Apple trackpad lets you use the trackpad to select, open or close, and drag without using the trackpad button

Upgrades

- 100-MHz PowerPC 603e
- 10.4-in. active-matrix, color display (requires PowerPC upgrade)
- Infrared technology for easy file sharing
- Video-out to support external displays— compatible with most Apple, VGA, and SVGA monitors (Apple 8-bit solution available; third-party solution for greater bit depths)

Disability Access

- System software includes CloseView, and Easy Access, and provides the ability to substitute visual cue for beep

Electrical Requirements

- Line voltage: 100 to 220 volts AC
- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 41 degrees to 95 degrees F
(5 degrees to 35 degrees C)
- Storage temperature: 14 degrees to 140 degrees F
(-10 degrees to 60 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Size And Weight

- Height: 2.0 in. (5.1 cm)
- Width: 11.5 in. (29.2 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 6.0 lb. (2.7 kg)

Article Change History:

18 Jan 1996 - Corrected info about sound output port.

05 Oct 1995 - Updated battery information.

25 Aug 1995 - Reviewed for technical accuracy.

Sound & Displays Control Panel: Requires AppleScript 11/95

Revised: 11/9/95
Security: Everyone

Sound & Displays Control Panel: Requires AppleScript 11/95

=====

Article Created: 21 August 1995
Article Reviewed/Updated: 9 November 1995

TOPIC -----

When I try to open the Sound & Displays control panel on my Power Macintosh 7500 or 8500 computer, I get the message "Sorry... Sound & Displays cannot operate correctly on this Macintosh. Please consult your Sound & Displays documentation for a description of what your Macintosh needs for Sound & Displays. (Quit)". This came with my computer and it used to work. How can I resolve this?

DISCUSSION -----

The Sound & Displays control panel that comes with Power Macintosh 7500 and 8500 computers requires AppleScript in order to operate properly. The Sound & Display control panel will not launch and will report this error message if AppleScript is missing, damaged, or disabled.

Make sure AppleScript has not been disabled by opening the Extensions Manager in your Control Panels folder under your Apple Menu. If there is not a check to the left of the AppleScript Extension, click on the extension to put a check there, close the Extensions Manager, and restart you computer.

If the Sound & Displays control panel still fails to launch, you should reinstall AppleScript using the custom install feature of your Power Macintosh disc.

Launcher: -39 Error (8/95)

Revised: 8/21/95
Security: Everyone

Launcher: -39 Error (8/95)

=====

Article Created: 21 August 1995

TOPIC -----

I get a -39 error when I try to open my Launcher. What does this mean and how can I fix it?

DISCUSSION -----

A -39 error is an end of file error. This error usually occurs when a file becomes damaged. If you are getting a -39 error when you try to open your Launcher, you should drag the Launcher out of the Control Panels folder and put it in the Trash. You can then reinstall the Launcher control panel from your backup disks, your Macintosh Performa CD, or your original System 7.5 CD or floppy disks.

Macintosh PowerBook 190cs/66: Description (04/97)

Revised: 4/3/97
Security: Everyone

Macintosh PowerBook 190cs/66: Description (04/97)

Article Created: 21 August 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 190cs/66 computer.

DISCUSSION -----

Overview
=====

The Macintosh PowerBook 190cs/66 is the most affordable color PowerBook computer, combining the performance of the Motorola 68LC040 processor with the convenience of a compact, lightweight notebook computer. It offers a host of enhanced features, including a 10.4-inch dual-scan color display, PC Card slots, an expansion bay, a full-size keyboard, an improved Apple trackpad for increased functionality, and a number of upgrade options.

Featuring an innovative design, the PowerBook 190cs/66 is both expandable and flexible. It provides an expansion bay for third-party peripherals—the floppy disk drive can be removed and be replaced with an additional storage device or an internal AC adapter. Through its PC Card slots, you can add a wired or wireless modem, storage, Ethernet networking, or any of a host of capabilities.

To get you started working right away, the PowerBook 190cs/66 comes bundled with ClarisWorks integrated productivity software. ClarisWorks combines word processing, spreadsheet, database, graphics, and communications capabilities. In addition, with your PowerBook 190cs/66.

Already a powerful and complete system, the PowerBook 190cs/66 is designed to grow in capabilities as your needs change. If your tasks demand higher performance, you can upgrade your system to PowerPC RISC technology. You can improve the display capability by upgrading to an active-matrix screen (requires PowerPC upgrade). And you can opt to add infrared technology for easy file

sharing, as well as color video-out.

So if you need a color display and want an affordable, highly capable notebook computer that can take you into the future, the PowerBook 190cs/66 is the perfect choice.

Features

=====

Innovative New Design

- Uses a 66/33-MHz 68LC040 processor
- Provides a 10.4-in. (diagonal), backlit, dual-scan, color display with 256 colors
- Includes a high-capacity internal 500 MB hard disk drive
- Offers stereo sound output capable of driving headphones or external speakers
- Comes with built-in serial and SCSI ports
- Features an improved Apple trackpad for increased functionality, full-size keyboard and integrated palm rest

Expandability

- Includes PC Card slots for two Type I or II PC Cards or one Type III PC Card
- Features an expansion bay for third-party solutions, such as a second hard disk drive, magneto-optical drive, or internal AC adapter

A Complete Solution

- Includes everything you need to be productive—right out of the box
- Comes with ClarisWorks productivity software
- Includes the PowerBook Mobility Bundle, software designed to enhance mobile computing
- Comes with System 7.5
- Provides active assistance in learning new features through Apple Guide
- Can be upgraded to take advantage of PowerPC processor technology
- Can be upgraded to feature an active-matrix display (requires PowerPC upgrade)
- Can be upgraded to provide easy file sharing through infrared technology
- Can be upgraded to include color video-out capabilities

Bundled Software

=====

The Macintosh PowerBook 190 models ship with Macintosh System Software 7.5.2. Each configuration also comes with the PowerBook Mobility Bundle. The Bundle includes the following components:

PowerBook Mobility Bundle

-
- PowerTalk 1.0
 - Macintosh PC Exchange
 - Macintosh Easy Open
 - Apple Remote Access
 - PowerBook Control Strip
 - Floppy Disk Maker
 - Disk Image Mounter
 - Password Protection Software
 - Eric's Ultimate Solitaire Sample
 - Spin Doctor
 - Super Maze Wars
 - PowerBook Demo

Other Third-Party Software

Macintosh PowerBook 190 computers also ship with ClarisWorks 4.0.

What's In The Box

=====

The following components are expected to be included in the box with all Macintosh PowerBook 5300 computers:

- Macintosh PowerBook 190 computer
- Macintosh PowerBook 190 User's Guide
- Macintosh PowerBook 190 Technical Specifications sheet
- ARA Client User's Guide
- ARA Promotion Flyer
- Registration card
- Packing List
- Disk Tools diskette
- Power Cord
- AC adapter
- Protective Battery Cap/Cover
- Resource Guide including
 - Warranty
 - Software License Agreements
 - Apple logo decals
 - Citibank VISA Brochure and Application
 - Tote Bag Catalog
- ClarisWorks 4 Manual

Ordering Information

=====

PowerBook 190cs/66 4/500

- PowerBook 190cs/66 computer with 4 MB of RAM, built-in 1.4 MB Apple SuperDrive, and internal 500 MB hard disk drive, Nickel-Metal-Hydride battery and AC adapter, System software version 7.5.2, ClarisWorks 4.0 software and documentation, PowerBook Mobility Bundle, Complete setup, learning, and

reference documentation, Limited warranty

- Order No. M4072LL/A

PowerBook 190cs/66 8/500 (this configuration was discontinued in 9/96)

-
- PowerBook 190cs/66 computer with 8 MB of RAM, built-in 1.4 MB Apple SuperDrive, and internal 500 MB hard disk drive, Nickel-Metal-Hydride battery and AC adapter, System software version 7.5.2, ClarisWorks 4.0 software and documentation, PowerBook Mobility Bundle, Complete setup, learning, and reference documentation, Limited warranty
 - Order No. M4073LL/A

Macintosh PowerBook Logic Board Upgrade Kit

-
- Order No. M3881LL/A

Macintosh PowerBook 190cs/66:Technical Specifications (9/96)

=====

Article Created: 21 August 1995
Article Reviewed/Updated: 11 September 1996

TOPIC -----

This article contains a list of technical specifications for the Macintosh PowerBook 190cs/66 computer.

DISCUSSION -----

Microprocessor

- 66/33-MHz Motorola 68LC040

Memory

- 4 MB or 8 MB* of RAM, expandable to 36 MB or 40 MB
[Note: The 4 MB or 8 MB (depending on the model) from Apple is soldered to the logic board. There is one RAM card expansion slot.]

NOTE:

- * The PowerBook 190cs/8/500 configuration was discontinued in 9/96.

Storage

- Built-in removable Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal 500 MB hard disk drive
- One expansion bay for third-party solutions such as an additional hard disk drive or magneto-optical drive

Display

- 10.4-in. (diagonal) backlit, dual-scan, color display
- Resolution: 640 by 480 pixels with 256 colors

PC Card slots (PCMCIA)

- Two PC Card slots that can accommodate two Type I or II PC Cards or one Type III PC Card
- Lets you add industry-standard PC Cards such as Ethernet networking, a wired or wireless modem, storage, or other capabilities

Expansion bay

- IDE connector for third-party solutions such as an additional hard drive, a magneto-optical drive, and other devices
- Power lines for connection of an internal AC adapter and other third-party solutions

Battery

- Nickel-metal-hydride battery provides 2.5 to 4.5 hours of use before recharge
- Nickel-metal-hydride battery recharges in 2.5 hours while computer is shut down, in sleep mode, or running
- PowerBook Control Strip lets you monitor time remaining, charge status, and battery usage

Ports

- One Apple Desktop Bus (ADB) port
- One serial (RS-422) port
- One SCSI port for connecting as many as six external devices
- One power adapter port
- Stereo sound output port
- Video output port (optional)

Networking

- Serial/LocalTalk port for AppleTalk connections to networks and printers
- Ethernet networking through PC Cards
- Optional infrared technology allows for ultra-easy file sharing through infrared technology—without cable connections or time-consuming setup; supports AppleTalk protocol

Built-in stereo sound

- 16-bit, CD-quality stereo sound capable of driving headphones or external speakers
- Built-in speaker and integrated microphone

Security

- Includes a security slot that secures the system, battery, and expansion bay (requires a third-party accessory)
- Includes password protection software

Keyboard and improved Apple trackpad

- Built-in, full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys and integrated palm rest
- Power button on keyboard
- Solid-state improved Apple trackpad lets you use the trackpad to select, open or close, and drag without using the trackpad button

Upgrades

- 100-MHz PowerPC 603e
- 10.4-in. active-matrix, color display (requires PowerPC upgrade)
- Infrared technology for easy file sharing
- Video-out to support external displays—compatible with most Apple VGA, and SVGA monitors (Apple 8-bit solution available; third-party solution for greater bit depths)

Disability Access

- System software includes CloseView and Easy Access, and provides the ability to substitute visual cue for beep

Electrical Requirements

- Line voltage: 100 to 220 volts AC
- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 41 degrees to 95 degrees F (5 degrees to 35 degrees C)
- Storage temperature: 14 degrees to 140 degrees F (-10 degrees to 60 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

Size And Weight

- Height: 2.2 in. (5.3 cm)
- Width: 11.5 in. (29.2 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 6.3 lb. (2.9 kg)

Article Change History:

- 11 Sep 1996 - Added information about discontinued configuration.
- 05 Oct 1995 - Updated battery information.

Open Transport 1.0.7: Read Me (5/96)

Revised: 5/27/96
Security: Everyone

Open Transport 1.0.7: Read Me (5/96)

Article Created: 22 August 1995
Article Reviewed/Updated: 26 May 1996

TOPIC -----

This article is the Open Transport ReadMe file.

DISCUSSION -----

Name: Open Transport 1.0.7 Patch
Version: n/a
Released: August 21, 1995
Description: This application updates Open Transport from version 1.0.6 to version 1.0.7. Please see below for further information.

The enclosed file is a self-extracting archive. To use, download, double-click the downloaded file (this decompresses it).

From the "Open Transport 1.0.7 Patch Read Me"
=====

What is this patch?

The Open Transport 1.0.7 patch consists of a patching application called "Open Tpt 1.0.6 -> 1.0.7 Patcher", a new TCP/IP Control Panel, and this Read Me file.

"Open Tpt 1.0.6 -> 1.0.7 Patcher" is a self-contained application that provides an update to the Open Transport software already installed on your system. To use this update application you must have Mac OS version 7.5.2 installed on your computer, and you must have Open Transport version 1.0.6 already installed on your system.

When successfully completed, the Open Transport Internet Library and the TCP/IP control panel will have been updated to Open Transport version 1.0.7. All other components of Open Transport will remain at version 1.0.6.

Who needs this patch?

This update is recommended for all Power Macintosh systems with the PCI bus, including the Power Macintosh 7200, 7500, 8500, and 9500. It will be especially valuable if you use SLIP or PPP to access the Internet or other TCP/IP resources.

This update CANNOT be used with any beta or test versions of Open Transport, or on the Power Macintosh 6100, 7100, 8100, or 680x0-based Macintosh computers.

How do I use this patch?

-
- 1) Copy "Open Tpt 1.0.6 -> 1.0.7 Patcher" and the TCP/IP control panel to your desktop.
 - 2) Choose Restart from the Special menu. While your computer starts up, hold down the Shift key (to turn off any extensions).
 - 3) Drag the TCP/IP control panel to the icon of your System Folder (not to the open System Folder window). In the dialog box that appears, click OK. Another dialog box opens, asking if you want to replace the older version of the control panel. Click OK to copy the new TCP/IP control panel to the Control Panels folder inside your System Folder.
 - 4) Double-click the "Open Tpt 1.0.6 -> 1.0.7 Patcher" icon to open it.
 - 5) Read the information in the dialog box that appears.
 - 6) Click the Patch button.
 - 7) In the dialog box that appears, select your Open Tpt Internet Library in your Extensions folder (inside the System Folder on your startup disk). Then click the Patch button.
 - 8) A message appears telling you the patch was successful.
 - 9) Choose Restart from the Special menu. Allow your computer to start up normally, without holding down the Shift key.
 - 10) Drag the "Open Tpt 1.0.6 -> 1.0.7 Patcher" from the desktop to the trash and empty it.

What are the differences between Open Transport 1.0.6 and 1.0.7

=====

- Slip/PPP Configuration Change

When using SLIP or PPP over Open Transport 1.0.7, either with Manual or BOOTP configuration mode, you are no longer required to configure a Router address or a Subnet Mask. When these are not manually configured, they will be generated automatically based on the IP address assigned by the SLIP/PPP server or by the

BOOTP server.

In general, it is recommended that these fields be left blank when using SLIP or PPP unless your network manager has specified otherwise. If you do manually configure these items, you must enter a Subnet Mask that places your Router's IP address and your own assigned IP address on the same subnet. If these two addresses are on different subnets, you won't be able to send data to remote hosts.

- Improved SLIP or PPP Performance

SLIP or PPP throughput performance has been improved by changing the interrupt level at which inbound SLIP or PPP data is processed.

- Networks with more than 256 zones

The TCP/IP control panel now works correctly with networks having more than 256 zones. Previous versions of the control panel sometimes crashed when selecting a zone on a network with more than 256 zones.

Question:

I have a Power Mac 9500 with an earlier version of Open Transport software. How do I get a copy of Open Transport version 1.0.6 so that I can use this patch?

Answer:

Users who previously bought a Power Macintosh 9500 can get an upgrade to the new software by calling the Apple Order Center. This update is strongly recommended for all Power Macintosh 9500 users.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

26 May 1996 - Updated for technical accuracy.

20 Nov 1995 - Added new keyword.

ARA: How Do Remote Systems Get Assigned Node Addresses (8/95)

Revised: 8/22/95
Security: Everyone

ARA: How Do Remote Systems Get Assigned Node Addresses (8/95)

=====

Article Created: 22 August 1995

TOPIC -----

How does a remote system get assigned an AppleTalk node address when dialing in through Apple Remote Access (ARA)? Is the AppleTalk address dynamically assigned at connection, or does the ARA MultiPort (MP) Server assign the node address?

DISCUSSION -----

AppleTalk node address allocation occurs when an ARA MP Server's ports are configured at startup. When a port is turned on, the ARA MP Server goes on the network to see what node addresses are available and allocates one per port based on that availability, in other words, dynamic address allocation. That is why configuring the ports takes some time.

A port will retain this same node address for all calls made to that port, even if someone dials in, disconnects, and then dials back to the same port. The same node address will be used. If the port is turned off, the node address may get used by another computer on the network. When you turn the port back on, the process mentioned above is repeated.

So, to answer the question, the node address is "static" as long as the port is on.

Color LaserWriter 12/600 PS: Lines Per Inch (1/97)

Revised: 1/31/97
Security: Everyone

Color LaserWriter 12/600 PS: Lines Per Inch (1/97)

Article Created: 22 August 1995
Article Reviewed/Updated: 31 January 1997

TOPIC -----

What is the line screen (lpi) capability of the Color LaserWriter 12/600 PS? Can you change it with programs that can edit the linescreen?

DISCUSSION -----

The default line screen, on the Color LaserWriter 12/600 PS and the Color LaserWriter 12/660 PS printers, is 200 lpi. At that line screen, the printer can image "122 levels of gray." However, Color Photograde changes the line screen based on the type of image and actually gives you more levels of gray (or color to be more precise) and much better image quality through Apple's proprietary technology.

Lighter areas of a file are imaged at a lower line screen (141 lpi) which produce more shades of color, but have a lower image resolution. Darker areas are imaged at a higher line screen which produces fewer shades of color but a higher resolution.

The line screen angle (the angle at which the actual dots are placed) is also changed to try and minimize an effect called "white dropout " which comes up with very light colors and the "white gap" effect that comes up with darker color plates next to each other.

This is done when the image is processed by the ROM of the printer. A file is separated into four color plates and analyzed for image quality. The line screen and angle change so that lighter areas are printed with some color visible, since our eye can see color at low percentages but can not see the actual edges of the colored objects. In darker areas, our eyes can see the edges of objects very well, but have trouble seeing the differences between darker shades of color.

Although the September 1995 "MacUser" article infers that you can change the

line screens, Color Photograde overrides any of these settings to produce it's patterns. You may be able to incorporate a line screen into the actual file when you scan it or edit it.

For more information on lpi and dpi see "Printing Differences: Lines Per Inch and Dots Per Inch" and "Apple LaserWriters: Screen Frequency and Gray Levels."

LW 16/600 PS: Input/Output Processor (IOP) ROM Upgrade (1/96)

Revised: 1/12/96
Security: Everyone

LW 16/600 PS: Input/Output Processor (IOP) ROM Upgrade (1/96)

Article Created: 22 August 1995
Article Reviewed/Updated: 12 January 1996

TOPIC -----

Several LaserWriter 16/600 PS network issues are addressed by version 2.0 of the Input/Output Processor (IOP) ROM (service part number 922-1856). Please read the following symptoms to determine whether a customer will benefit by updating their LaserWriter 16/600 printer's IOP ROM.

DISCUSSION -----

NOTE:
PostScript ROMs are unaffected by this IOP upgrade. The PostScript ROMs in the LaserWriter 16/600 printer are unchanged; the current version is version 1.0, which is the same version that originally shipped with the printer.

Printer Not Available in Chooser

=====

The Apple LaserWriter 16/600 PS does not respond to Ethernet traffic. It can not be seen in the Chooser.

Restarting the printer temporarily resolves this problem. There are presently two shipping LaserWriter 16/600 PS IOP ROM versions, version 1.0 and 2.0. Recommend customers upgrade their LaserWriter 16/600 PS printer's IOP to v2.0. These ROM revisions are printed on the startup page, vertically on the right margin.

You can also use the Apple Printer Utility to check what version of the IOP ROM the LaserWriter has installed:

Step 1

Launch the Apple Printer Utility, select the zone in which the LaserWriter 16/600 is located, click to select the printer, click Open Printer.

Step 2

Click the arrow to the left of Printer Information, and note the version of the PostScript and IOP ROMs listed under ROM Revision. The I/O ROM should be 2.0.

Printer Available in Chooser

=====

The Apple LaserWriter 16/600 PS can be seen in the Chooser, but you cannot print to it.

Restarting the printer may temporarily resolve this issue, as will updating to v2.0 IOP ROM.

NOTE:

The printer may require another solution instead, as similar symptoms may be caused by some versions of printer drivers or routers. Follow the workarounds below if the two suggestions above do not address the symptoms.

* The symptom may be caused by earlier versions of the LaserWriter 8.x drivers. Upgrade to LaserWriter 8.2.2 or later driver software.

* Similar symptoms are caused by a Name Binding Protocol (NBP) gleaning problem in some routers, including Cisco routers and the Apple Internet Router 3.0. To work around this problem with Cisco routers, upgrade the Cisco software to v10.2 or later or turn NBP gleaning off. To work around this problem with an Apple Internet Router, update the Ethernet driver with Network Software Installer 1.5 or later. Both these routers induce the symptoms only under specific circumstances.

NOTE:

LaserWriter driver or gleaning problems are not specific to the LaserWriter 16/600 PS printer. Other printers or devices may also be affected.

Symptoms Occurring with Dayna PathFinder Routers

=====

The LaserWriter 16/600 PS is not visible on networks routed by Dayna PathFinder Routers.

This symptom is caused by the LaserWriter 16/600 PS booting with a source network of 1 and the PathFinder not asserting itself to tell the printer what network range it should be in (most likely a number other than 1). In turn, the PathFinder does not respond to the printer's request for zone information, resulting in devices not being able to locate the printer.

Other symptoms may occur when multiple routers exist in addition to the Dayna PathFinder (including not being able to locate the printer in the Chooser, not being able to open a connection with the Chooser, and receiving PostScript errors when printing). A network trace may reveal that the PathFinder is not responding to the printer's Zone Information Protocol/Get Net Info (ZIP GNIs).

These symptoms are addressed in the v2.0 IOP ROM. Service Providers should replace the ROM.

Slow Printing

=====

The LaserWriter 16/600 PS is slow when using Farallon PhoneNET Star Controllers.

When a LaserWriter 16/600 PS is connected to a Farallon PhoneNET StarController, print jobs sent to the printer take a long time to print (typical) or may fail (rare) with PostScript errors. The reason for this symptom is that the LaserWriter 16/600 PS begins transmitting prematurely after receiving the StarController's LocalTalk Link Access Protocol (LLAP) packet.

This symptom is addressed in the v2.0 IOP ROM. Service Providers should replace the ROM.

IOP Does Not Close Jobs Correctly

=====

The IOP does not close jobs correctly (that is, when a PostScript error is encountered) without an End of File (EOF) message; a second job following the first gets flushed by the PostScript interpreter (to the second job's EOF), so neither the first job having the error nor the second job prints. A third job will print fine.

This symptom is addressed in the v2.0 IOP ROM. Service Providers should replace the ROM.

LED Continues to Blink

=====

The Ready/In Use LED continues to blink for five minutes when spooling jobs from an AppleShare print server.

The LaserWriter 16/600 PS printer's Ready/In Use light will blink for five minutes following a print job spooled to it from an AppleShare Print Server, until the "wait timeout" timer actually times out. If the printer is released from within the print server, the blinking stops immediately. If jobs are sent directly to the printer, the printer stops blinking as soon as the job is printed. This symptom does not interfere with printing.

This cosmetic symptom is resolved by updating to the v2.0 IOP ROM.

Symptoms Not Associated with IOP ROM

=====

The following issue is unrelated to the IOP ROM: The LaserWriter 16/600 PS returns to the default zone after being turned on.

The configuration switch on the LaserWriter 16/600 PS must be in the up position if you want zone changes made with the Apple Printer Utility to be persistent

across power cycles.

NOTE:

The version v2.0 IOP ROM addresses only the symptoms listed in previous sections. If the LaserWriter 16/600 PS printer is experiencing other symptoms, follow standard troubleshooting procedures outlined on the Service Source CD-ROM (Path: Laser Printers, LaserWriter 16/600 PS, Troubleshooting). Service Source is only available to Apple Service Providers.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

12 Jan 1996 - Added information on how to check ROM version.

02 Oct 1995 - Reviewed for accuracy. Made minor grammatical corrections.

Security: Everyone

Open Transport: Brief File Description (7/96)

=====

Article Created: 22 August 1995
Article Reviewed/Updated: 15 July 1996

TOPIC -----

This article provides a brief description of Open Transport files and their functions. The following files are covered:

Open Tpt AppleTalk Library
Open Tpt ATalk 68K Library
Open Tpt Internet Library
Open Tpt Inet 68K Library
Open Transport Library
Open Transport 68K Library
OpenTptAppleTalkLib
OpenTptInternetLib
OpenTransportLib

Ethernet (built-in)
Serial (built-in)

AppleTalk
TCP/IP

AppleTalk Preferences
TCP/IP Preferences

Shared Library Manager
Shared Library Manager PPC

DISCUSSION -----

The following files contain code resources for Open Transport:

Open Tpt AppleTalk Library
Open Tpt ATalk 68K Library

Open Tpt Internet Library
Open Tpt Inet 68K Library
Open Transport Library
Open Transport 68K Library
OpenTptAppleTalkLib
OpenTptInternetLib
OpenTransportLib

The files with names that contain the word "AppleTalk" have code resources specific to AppleTalk. The files with names that contain the word "Internet" have code resources specific to TCP/IP. The files with names that do not contain the words "AppleTalk" or "Internet" contain code resources for Open Transport in general. If you do not want to run AppleTalk on a system, all you have to do is remove all the files with the word "AppleTalk" in the file name. If you do not want to run TCP/IP on a system, all you have to do is remove all the files with the word "Internet" in the file name.

OpenTransportLib and Open Transport Library are shared libraries that implement core Open Transport services on PowerPC systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.

OpenTptAppleTalkLib and Open Tpt AppleTalk Library are shared libraries that implement Open Transport AppleTalk protocols and services on PowerPC systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.

OpenTptInternetLib and Open Tpt Internet Library are shared libraries that implement Open Transport TCP/IP protocols and services on PowerPC Mac OS systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.

Open Transport 68K Library is a shared library that implements core Open Transport on 680x0 systems.

Open Tpt ATalk 68K Library is a shared library that implements Open Transport AppleTalk protocols and services on 680x0 Mac OS systems.

Open Tpt Inet 68K Library is a shared library that implements Open Transport TCP/IP protocols and services on 680x0 Mac OS systems.

The "Ethernet (built-in)" and "Serial (built-in)" are files that contain code to make it possible to access the respective ports with Open Transport. If you do not want to use the built-in Ethernet port with Open Transport, you could remove the "Ethernet (built-in)" file. The same is true if you do not want to use the built-in serial ports with Open Transport; you would remove the "Serial (built-in)" file.

AppleTalk is the control panel application replacing the classic Network control panel.

TCP/IP is the control panel application replacing the classic MacTCP and

AdminTCP control panels.

The "AppleTalk Preferences" and "TCP/IP Preferences" contain the preferences for the AppleTalk and TCP/IP control panels.

Shared Library Manager and Shared Library Manager PPC are extensions that implement the Apple Shared Library Manager for 680x0 and PowerPC, respectively.

HyperStudio: Version and Support Information (2/96)

=====
Article Created: 22 August 1995
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article contains version information for HyperStudio, and who to contact for technical support.

DISCUSSION -----

HyperStudio, is a HyperCard-based multimedia stack for the Macintosh, by Roger Wagner Publishing, which is included in certain Apple Education Bundles.

HyperStudio Versions
=====

- Version 1.0: Because this version is older, it may not be compatible with newer Macintosh computers. You should contact Roger Wagner Publishing for upgrade information.
- Version 2.0: The most recent 2.0 version of Hyperstudio is version 2.097. Version 2.092 is bundled with the Elementary and Secondary Reference Bundles in the Apple Education Series. This version will not run on computers connected to a network (localtalk or ethernet). Customers running earlier versions of 2.0 can upgrade to 2.097 by contacting Roger Wagner Publishing.
- Version 3.0: As of 26 February 1996, version 3.0 is the most recent version of Hyperstudio. It is bundled with Apple's Multimedia Learning Tools Bundle (for the Power Macintosh 5200 LC and Power Macintosh 5300 LC) in the Apple Education Series. 3.0 will not work on older Macintosh computers, including the Macintosh Classic, Macintosh Plus, Macintosh SE, or any other Macintosh computer (including Performa models) with a monochrome display.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for

additional information.

Power Macintosh 9500: MacroMedia FreeHand 5.0 Needs Update 8/95

=====

Article Created: 22 August 1995

TOPIC -----

When I run MacroMedia FreeHand 5.0 on my Power Macintosh 9500, the Xtras do not load. How can I get these to run?

DISCUSSION -----

You need to update to version FreeHand 5.0.2, which specifically addresses this issue. MacroMedia has separate updaters from 5.0 to 5.0.1, and from 5.0.1 to 5.0.2, so you need to update FreeHand 5.0 with both. Contact MacroMedia for update information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Open Transport Patch 1.0.1/1.0.7: Which File Is Updated (10/95)

Revised: 10/3/95
Security: Everyone

Open Transport Patch 1.0.1/1.0.7: Which File Is Updated (10/95)

=====

Article Created: 22 August 1995
Article Reviewed/Updated: 3 October 1995

TOPIC -----

After applying either the Open Transport (OT) Patch 1.0.1, or Patch 1.0.7, the info dialog box on selected Open Transport files will not be updated from Open Transport 1.0 or 1.0.6. Why hasn't the version number changed and how can I tell which version I have?

DISCUSSION -----

Open Transport 1.0.1 Patch

The Open Transport Patch 1.0.1 patches the Open Tpt Internet Library file located in the System Extensions folder, and does not update the version of either the AppleTalk, or TCP/IP control panel. To see if the patch has been applied, single click on the Open Tpt Internet Library file and select the Get Info command from the File menu.

Open Transport 1.0.7 Patch

The Open Transport 1.0.7 Patch Read Me file states: "When successfully completed, the Open Transport Internet Library and the TCP/IP Control Panel will have been updated to Open Transport version 1.0.7. All other components of Open Transport will remain at version 1.0.6."

After applying the Open Transport 1.0.7 Patch, selecting the Get Info command from the File menu on the files below will report the this version information:

- TCP/IP control panel reports: Open Transport 1.0.6, TCP/IP 1.0.7
- Open Tpt Internet Library reports: version 1.0.7

Open Transport stays at version 1.0.6, only the versions of the TCP/IP control panel and the Open Tpt Internet Library change to version 1.0.7.

Article Change History:

03 Oct 1995 - Added Open Transport 1.0.7.

PowerBook 5300 Series: Read Me File (4/97)

=====

Article Created: 23 August 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

The following is the ReadMe file for the PowerBook 5300 Series computers.

DISCUSSION -----

Important Information About Your Macintosh PowerBook 5300 Series Computer

Congratulations on purchasing your Macintosh PowerBook 5300 series computer. This document adds to and updates the information in the manuals that came with your computer. It is a good idea to read this document now, and keep a copy handy for future reference.

If your PowerBook is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

Contents
=====

Tips

- Charging your battery
- Using the Battery Monitor in the Control Strip
- Using the trackpad
- Using a modem
- Using expansion bay modules
- Using PC Cards
- Using a DOS-formatted PC Card
- Using your PowerBook in SCSI disk mode
- Using Apple IR File Exchange
- Using the Password Security control panel
- Printing

Troubleshooting

- Problems starting your PowerBook
- Resetting the parameter RAM (PRAM)
- Using Drive Setup
- Using Acrobat Reader after installing QuickDraw GX
- Using Apple Remote Access
- Incorrect Guide File Balloons
- Using a DigiSign Signature Card with PowerTalk
- AppleShare Displays Incorrect Information for Large Drives
- AppleShare Server Software Version 4.1
- Application Programs Using Sound
- Using QuickDraw GX with a Fax Modem
- Using PowerTalk and PowerTalk Direct Dialup Mail
- Using the Japanese or Chinese Language Kit

Important Information About Virtual Memory

====

Tips

====

Charging your battery

=====

You should connect the power adapter to your computer and let the battery charge overnight when you first unpack your computer. (The battery may have been depleted between the time it was charged at the factory and the time you purchased the computer.)

Using the Battery Monitor in the Control Strip

=====

- The estimated time remaining that is displayed in the Battery Monitor portion of the Control Strip depends on the charge remaining and the battery consumption rate. The battery consumption rate depends on the software and hardware features you are using.
- The battery icon in the Battery Monitor portion of the Control Strip may show the battery as charging even after the PowerBook has been plugged in for a while. This is normal for Lithium Ion (Li+) batteries.

Using the trackpad

=====

If the trackpad seems unresponsive, try the following in the order listed:

Step 1

Put your PowerBook to sleep (by closing the display) and then wake it up (by pressing any key on the keyboard).

Step 2

Press the reset button on the back of the computer.

Step 3

Reset the parameter RAM (PRAM) (see the section in Troubleshooting below for instructions).

Step 4

Attach an external mouse.

Using a modem

=====

- To improve modem performance, turn off LocalTalk in the Network control panel.
- Modem connection files for various PC Card modems that will work with Apple Remote Access (ARA) are included on your computer's hard disk. If a file for your modem is not included, please contact your communications software manufacturer to see if your modem is supported. See the user's manual that came with your computer for more information on using PC Card modems.
- When accessing the Internet using the InterSLIP protocol, use the 14.4K baud rate rather than the 28.8K baud rate for better performance. The actual throughput at 14.4K baud is higher than at 28.8K baud.

Using expansion bay modules

=====

Never remove a floppy disk from the expansion bay module while the PowerBook is in sleep. You may damage the disk or lose data.

Using PC Cards

=====

- For best results, purchase only cards that have been qualified for use on a Macintosh computer. If you are in the United States, you can receive a faxed list of currently available PC Cards by calling 1-800-462-4396 and requesting document 10307. You can call this number anytime. In Canada, call 1-800-263-3394 and request document 10307. Outside the United States and Canada, please consult your Apple-authorized dealer.
- Don't use an SRAM storage card as a startup disk on your PowerBook. Use SRAM cards for extra storage only.
- If you are using a mass storage PC Card, you can only eject the card using the eject buttons when the computer is shut down. The eject buttons will not work with storage PC Cards when the computer is turned on.
- Never eject a PC Card manually (with a paper clip) while the PowerBook is in sleep. You may damage the card or lose data.

Using a DOS-formatted PC Card

=====

If your PowerBook has the Macintosh PC Exchange control panel installed and PC

Exchange is turned on, you can use a PC Card that has been pre-formatted in a DOS format in your PowerBook. However, you cannot start up your computer using the DOS-formatted PC Card; you can only start up your computer using a Mac OS-formatted PC Card. If you want to reformat your DOS-formatted PC Card as a Mac OS-formatted PC Card, you need to turn PC Exchange off, and then format the card as you would any non-Mac OS-formatted disk. Follow these steps:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Open the PC Exchange control panel.

Step 3

Click the Off button and close the PC Exchange control panel.

Step 4

Insert your PC Card. A window appears asking if you want to initialize (format) the disk.

Step 5

Click Initialize to format the PC Card. Once the PC Card is reformatted, you can turn Macintosh PC Exchange back on in the PC Exchange control panel.

You cannot reformat a Mac OS-formatted PC Card as a DOS-formatted PC Card with PC Exchange. To do so, you need to use a DOS/Windows computer with PC Card capabilities.

Using your PowerBook in SCSI disk mode

=====

- Using Norton Utilities Speed Disk or Disk Doctor from a desktop computer on your PowerBook while it is in SCSI disk mode may cause the desktop computer to crash or freeze. To avoid this problem, create an emergency startup floppy disk using Norton Utilities and then use that disk to startup your PowerBook.
- You cannot use password protection on your PowerBook while the PowerBook is in SCSI disk mode. Turn off password protection in the Password Security control panel before connecting your PowerBook in SCSI disk mode.

Using Apple IR File Exchange

=====

Apple IR File Exchange provides a very simple way to exchange files with another IR-equipped Macintosh user.

- If you use Apple IR File Exchange with a computer that is equipped with a third-party IR device and is also connected to a wired network (for example, a LocalTalk or Ethernet network), you may see other Apple IR File Exchange users that are beyond your local IR network. If you want to prevent this from

happening, select IRTalk in the Network control panel on the computer that is connected to the wired network. (This will have the effect of disconnecting that computer from the wired network. See the manufacturer's manual for more details.)

- If you see a dialog box telling you there is a broken connection, make sure that both you and the other Apple IR File Exchange user select the same option (either "break connection" or "continue"). If the other user breaks the connection and you try to continue, your computer may appear to hang for 2 minutes while it tries unsuccessfully to reestablish the connection.
- When you select IRTalk in the Network control panel, your computer chooses a random network address. Occasionally, you may come within range of another computer using the same network address and experience difficulty communicating with it.

When this occurs, you'll see a dialog box telling you that a duplicate AppleTalk address has been detected. Click OK in the dialog box, then open the Network control panel and select IRTalk again. This will give your computer a new network address and will correct the problem. (Alternately, you can activate and inactivate AppleTalk from the Control Strip or the Chooser.)

Using the Password Security Control Panel

=====

The Password Security control panel provides security for information stored on your hard disk. To use this feature, you must enter a password and turn it on. If you forget or lose your password, you will not be able to access your hard disk. Should you lose your password, you may be charged for assistance.

You cannot use your PowerBook in SCSI disk mode with password protection turned on in the Password Security control panel. You must turn it off before using your PowerBook in SCSI disk mode.

Information stored on PC Cards is not protected by password security. Password security is designed to prevent casual access to your hard drive. It does not provide encryption.

Printing

=====

If you are printing on a network printer, make sure you have the same version of printer software as others on the network. If you are using a StyleWriter II on a network, make sure you use the StyleWriter 2.0 printer driver. (Printer drivers are found in the Extensions folder).

=====

Troubleshooting

=====

Problems starting your PowerBook

=====

If you have problems starting your PowerBook immediately after you shut it down

(for instance, you see the "Sad Mac" icon on the screen), wait several seconds after shutting down, and then press the Power key to turn the computer on again.

Resetting the parameter RAM (PRAM)

=====

When you need to reset (or "zap") your PowerBook's PRAM, follow the steps below. Note that resetting the PRAM erases the contents of your RAM disk, if you have one. Resetting the PRAM also restores the default settings in most control panels. After you reset the PRAM, be sure to check any custom settings you made for the desktop pattern, memory, network, AppleTalk, trackpad, power conservation, and so forth. Resetting the PRAM also resets the power manager. Follow these steps to reset the PRAM:

Step 1

Locate the keys Command, Option, P, and R.

Step 2

Make sure the Caps Lock key is not down.

Step 3

Restart your Macintosh. Immediately after hearing the startup sound, press the Command, Option, P, and R keys simultaneously. If you don't hold down the key combination within 5-10 seconds after you restart, you may need to repeat steps 1-3.

Step 4

Hold down the keys until you hear the startup sound. Then release the keys.

Step 5

If the computer shuts itself off, press the Reset key on the back of your computer to turn it back on. 6. When the computer has finished starting up, you may need to restore control panel settings as well as network and printer settings in the Chooser.

Using Drive Setup

=====

Make sure you only use the Drive Setup application program that comes with your PowerBook to update and partition hard disks. If you use an earlier version of Drive Setup (called HDSC Setup) you could damage your computer.

Using Acrobat Reader after installing QuickDraw GX

=====

Once you install QuickDraw GX, you need to reinstall Acrobat Reader on your computer in order to use it. Double-click the Acrobat Reader Installer icon in the Adobe Acrobat Reader folder (inside the Applications folder).

Using Apple Remote Access

=====

Make sure you use only Apple Remote Access Client version 2.0.1 on your PowerBook. Earlier versions will not work.

Incorrect Guide File Balloons

=====

Your system software includes Apple Guide documents which provide on-screen instructions and other information to help you use your computer. However, if you turn on Balloon Help (by choosing Show Balloons from the Guide menu) and point to a Guide file icon on the hard disk, the balloon may give you the wrong information about where the file belongs or what you can do with it. To avoid being misled by incorrect balloons, follow the guidelines below:

- Leave Guide files where they are. Some Guide files (for example, the Guide file named "Macintosh Guide") belong in the Extensions folder. Others will not work if they are put into the Extensions folder.
- Keep application programs that have Guide files in the same folder as the Guide file. For example, keep the file named "File Assistant Guide" in the same folder as the File Assistant program. If you move a Guide file that belongs with an application program, you won't be able to get help while using the program.

Using a DigiSign Signature Card with PowerTalk

=====

To use the Apple DigiSign Utility with PowerTalk, follow these steps:

Step 1

Turn off processor cycling in the PowerBook control panel. To see the option for processor cycling, hold down the option key while you select Custom in the PowerBook control panel.

Step 2

Follow the steps for creating a Signer file. If you need help, select "How do I obtain a valid Signer file?" in the Digital Signatures topic of the PowerTalk Guide.

Step 3

Turn processor cycling back on in the PowerBook control panel.

AppleShare displays incorrect information for large drives

=====

If you use file sharing to connect to a disk attached to another computer, and the shared disk is larger than 2 gigabytes (GB), the Get Info box for that disk shows an incorrect size. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

AppleShare Server software version 4.1

=====

If you purchase AppleShare server software version 4.1, make sure to choose Custom Install (instead of Easy Install) when you install it.

NOTE: This note is not part of the original Read Me, it is being added to correct information presented here. AppleShare 4.1 or later is not sold separately and is available when purchasing a Workgroup Server. Also AppleShare v 4.1 or 4.2 is not supported on these computers.

Application programs using sound

=====

If you have application programs that make extensive use of sound, you should turn off virtual memory while using those programs. When virtual memory is turned on, it can compromise the programs' sound quality.

Some older versions of programs, especially games, may generate sounds that seem too slow or too fast. For best results with these programs, open the Sound control panel, choose Sound Out from the pop-up menu, and set the sample rate to 22.050 kHz.

Using QuickDraw GX with a fax modem

=====

If you installed QuickDraw GX and you have a fax modem, you need a QuickDraw GX modem driver in order to send faxes. Contact the fax software manufacturer to obtain the QuickDraw GX driver.

If you have installed QuickDraw GX and do not yet have the QuickDraw GX modem driver, you can temporarily turn off QuickDraw GX and use your previous fax modem driver. To turn off QuickDraw GX:

Step 1

Hold down the Space bar while you choose Restart from the Special menu to restart your PowerBook. Continue to hold down the Space bar until the Extensions Manager appears on the screen.

Step 2

Click the QuickDraw GX extension to remove the check beside it. This prevents the QuickDraw GX software from loading.

Step 3

Click the close box in the Extensions Manager window to resume startup. Your fax modem should work normally. You won't be able to use any QuickDraw GX features until you turn the extension back on again.

Using PowerTalk and PowerTalk Direct Dialup Mail

=====

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Using the Japanese or Chinese Language Kit

=====

Before you install the Japanese or Chinese Language Kit software, you need to install World Script. Follow these steps:

Step 1

Double-click the Apple Extras folder to open it.

Step 2

Double-click the World Script Install folder to open it.

Step 3

Double-click the World Script Installer icon. Follow the instructions on the screen.

Step 4

Follow the instructions that came with the language kit to install the language kit software.

=====

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory may help you avoid running out of memory.

Your computer comes with virtual memory turned on. With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems using certain programs, you may want to turn off virtual memory. You may also want to turn virtual memory off from time to time to extend work time while using the battery. You can turn virtual memory on and off in the Memory control panel. For specific information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. Then click "How do I use hard disk space as memory?" and "How do I manage Power Macintosh memory?"

For best performance, try setting virtual memory to no more than 150% of the amount of physical memory (RAM), or no more than 50% of your currently available hard disk space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory

to a maximum of 24 MB (150% of 16, which is less than 50% of 50).

Note: You cannot set virtual memory to more than 1024 MB, even if you have 1 gigabyte or more available space on your hard disk.

To improve performance, you can also add physical memory (RAM) to your computer. See the user's manual that came with your computer for more information.

Plaintalk 1.4.1: Can't Install Recognition on 8-bit Mac (9/95)

Revised: 9/1/95
Security: Everyone

Plaintalk 1.4.1: Can't Install Recognition on 8-bit Mac (9/95)

=====

Article Created: 23 August 1995
Article Review/Updated: 1 September 1995

TOPIC -----

When I try to install English Speech Recognition (ESR) on my Performa 5200 or Performa 6200 series computer, I get an error message stating that "English Speech Recognition requires 16-bit sound input. It cannot be used on this Macintosh."

DISCUSSION -----

First, make sure that your computer supports 16-bit sound input:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound input radio button is grayed out, you only have 8-bit input, and English Speech Recognition will not work.

If 16-bit is not grayed out, make sure there is a dot in the radio button next to it.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

Now you can follow these steps to override the error message and install the ESR software:

Step 1

Restart your Macintosh computer, hold down the shift key on the keyboard until you get the message "Welcome to Macintosh, Extensions Off" screen.

Step 2

Open the ESR 1.4.1 installer either from the floppy disk or the folder you downloaded, ignore the error message you saw before.

Step 3

Select "Custom Install" from the "Easy Install" pull down menu. Make sure the check-box next to "English Speech Recognition Software" has an X in it, then click on the Install button in the bottom right hand side of the window.

Step 4

Restart your Macintosh computer. Plaintalk is ready to use.

Step 5

Under the Apple Menu, choose Control Panels. Click on the button with the question mark on the yellow background to go through an Introduction to Speech Recognition.

Article Change History:

01 Sep 1995 - Modified to include Performa 5200 series.

AppleShare 4.1 and Apple Internet Router 3.0.1 Issue (8/95)

Revised: 8/23/95
Security: Everyone

AppleShare 4.1 and Apple Internet Router 3.0.1 Issue (8/95)

=====

Article Created: 23 August 1995

TOPIC -----

Since installing Apple Internet Router 3.0.1 software on an Apple Workgroup Server, AppleShare 4.1 fails to launch with the this error message, "coprocessor not installed error".

DISCUSSION -----

AppleShare 4.1 uses a more recent version of the Apple Shared Library Manager (ASLM) than what is installed by the Internet Router.

Apple Internet Router 3.0.1 installs Shared Library Manager 1.0. While AppleShare 4.1 needs Shared Library Manager 1.1.2 or higher.

The issue can be resolved by performing a custom install of AppleShare 4.1 and selecting Shared Library Manager.

Open Transport 1.0.6: MacPPP 2.2.0 & SLIP/PPP Products (10/95)

Revised: 2/13/96
Security: Everyone

Open Transport 1.0.6: MacPPP 2.2.0 & SLIP/PPP Products (10/95)

Article Created: 24 August 1995
Article Reviewed/Updated: 5 October 1995

TOPIC -----

I've installed MacPPP 2.2.0 on my Power Macintosh which came with Open Transport 1.0.6 installed, but MacPPP 2.2.0 does not work. Are there other SLIP or PPP products that work with Open Transport 1.0.6? If there are products, please provide a list of those that do work.

DISCUSSION -----

Open Transport 1.0.7 supports the following MacTCP Link Access Modules (mdevs), with these known caveats.

InterSLIP

Version 1.0.1 is not compatible with Open Transport, you need a later version. InterCon should be contacted directly.

InterPPP

Use version 1.2.9 or more recent; may crash when receiving a large graphic file via HTML readers.

InterPPP II

Use the most current version.

MacSLIP

Use version 2.0.6 or more recent. "Connect at System Startup" does not work.

MacPPP

Use version 2.1.1SD or 2.1.2SD. The MacPPP "Open" button does not work; open a

connection by opening a TCP/IP application. Due to technical differences between the Open Transport and "classic" networking architectures, existing mdevs used with Open Transport cannot auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application; manual connections are supported. Once a TCP/IP application launches and uses a SLIP or PPP mdev, use of a different SLIP or PPP mdev requires restarting the Macintosh. Power Macintosh 9500 users are strongly encouraged to update older versions of Open Transport to v1.0.7 for improved compatibility. Apple is working with developers to better support existing mdevs. Contact the third party developer of interest for the most recent information on compatibility.

FreePPP

Is a derivative of MacPPP 2.0.1 which provides enhanced support for Open Transport. FreePPP is not an official Merit release, and its name has been changed to avoid confusion with all MacPPP derivatives. It requires System 7.1 or later and a Macintosh that supports Color QuickDraw.

Due to technical differences between the Open Transport and "classic" networking architectures, existing mdevs used with Open Transport cannot auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application; manual connections are supported. Once a TCP/IP application launches and uses a SLIP or PPP mdev, use of a different SLIP or PPP mdev requires restarting the Macintosh.

Power Macintosh 9500 users are strongly encouraged to update older versions of Open Transport to v1.0.6 for improved compatibility. Apple is working with developers to better support existing mdevs. Contact the third-party developer of interest for the most recent information on compatibility.

Applying the Open Transport 1.0.6 to 1.0.7 patch changes this information somewhat. With MacPPP 2.1.2SD, it is now possible to use the "Open" button to start a connection. MacPPP 2.1.2SD is the version we recommend using at this time. We do not recommend using any of the MacPPP 2.2.0x versions.

Here is an excerpt from the "Open Tpt 1.0.7 Patch Read Me":

- SLIP/PPP Configuration Change

When using SLIP or PPP over Open Transport 1.0.7, either with Manual or BOOTP configuration mode, you are no longer required to configure a Router address or a Subnet Mask. When these are not manually configured, they will be generated automatically based on the IP address assigned by the SLIP/PPP server or by the BOOTP server.

In general, it is recommended that these fields be left blank when using SLIP or PPP unless your network manager has specified otherwise. If you do manually configure these items, you must enter a Subnet Mask that places your Router's IP address and your own assigned IP address on the same subnet. If these two addresses are on different subnets, you won't be able to send data to remote hosts.

- Improved SLIP/PPP Performance

SLIP/PPP throughput performance has been improved by changing the interrupt level at which inbound SLIP/PPP data is processed.

- Networks with more than 256 Zones

The TCP/IP control panel now works correctly with networks having more than 256 zones. Previous versions of the control panel sometimes crashed when selecting a zone on a network with more than 256 zones.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

These articles can help you locate the Open Transport 1.0.6 to 1.0.7 patch mentioned in this article:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Universal Network Access Disk (8/95)

Revised: 8/24/95
Security: Everyone

Universal Network Access Disk (8/95)

Article Created: 24 August 1995

TOPIC -----

Is there an updated Universal Network Startup disk that will start up a Power Macintosh 7100/80? Is it technically possible and if so, will we see one anytime soon?

DISCUSSION -----

With the advent of System 7.1, it became impossible to build a start up floppy disk with System 7.1 for any machine, because of the enablers for every new machine. If you wanted something like AppleShare client and Ethernet capability on the floppy, you might be able to build one for a single machine, depending on the size of the enabler for that one machine.

System 7.5 unified all the commonality of every enabler and integrated the functionality into the System file itself. Thus, when System 7.5 was released it became possible to build, through the installer, an enabler-less, start up floppy. Squeezing the associated AppleShare and Ethernet files onto the disk was still a problem.

At that time engineering created the Network Access Disk, 7.5NAD. This was done by some custom trimming of the System file to remove as many resources as possible and compressing some remaining resources. This trimming left the System file still over 1 MB in size, but it freed space for four key files -- the Network control panel, Ethernet driver, Chooser, and AppleShare client -- with just 10 KB to spare.

With the release of the Power Macintosh 7100/80, 8100/100, and 8100/110 computers the first enablers, for System 7.5, appeared to support these systems. PCI-based Power Macintosh computers brought yet again, another enabler to support these systems. We are again heading to where we were before, with System 7.1, the need for enablers. System 7.5.x will have a growth in the number of enablers as more computers are released. The enabler for new computers will not fit on the 7.5NAD floppy based system.

When there is another unifying Mac OS release, the enabler functionality may be reincorporated into the System file again. Then it will take another effort to customize the minimum resources in the System file to allow the key network and sharing access files to also fit on a floppy disk.

Looking at the direction of the Mac OS with Open Transport, the key pieces needed to fit on the floppy now start to include Apple Shared Library Manager and associated files plus new control panels. The task, of a Network Access Disk to support Open Transport, now starts to look pretty daunting.

We may never see another universal floppy disk to start up the entire Macintosh product line. To support both 680x0 Macintosh and Power Macintosh, with NuBus or PCI, may involve a compromise using a couple disks or more, with each disk being one that addresses a subset of all Macintosh computers.

The existing Network Access Disk now supports the first generation Power Macintosh and earlier systems. Later systems (those requiring system enablers) have no comparable choice as of this writing. The best suggestion for starting up an "emergency" system on these later systems, with networking and AppleShare access, is the start up CD-ROM that comes with each system.

AppleVision 1710 Display: Only Resolution is 640x480 (1/97)

Revised: 1/29/97
Security: Everyone

AppleVision 1710 Display: Only Resolution is 640x480 (1/97)

=====

Article Created: 24 August 1995
Article Reviewed/Updated: 28 January 1997

TOPIC -----

I have connected my AppleVision 1710 display to the onboard video on my Power Macintosh 7500/100. The only available resolution is 640x480. In addition, the sound controls do not seem to work. I can adjust the volume and tone, but I do not see the changes represented on the control strip modules. The speaker and microphone cables from the monitor are connected to the corresponding ports on the Power Macintosh. I am not using the ADB connector for the monitor because I wanted to connect the keyboard directly to my Macintosh computer.

DISCUSSION -----

The AppleVision Display software uses the ADB cable to sense what kind of monitor is connected to the computer. If the integrated ADB/video cable is not used, then as you have mentioned, the only resolution available is 640x480 and the speaker controls on the front of the monitor will not bring up their corresponding control strip modules. The volume and tone buttons work, but you do not see the levels on your monitor control strip.

If the AppleVision 1710AV Display, or AppleVision 1710 Display is connected without the ADB connector to a Macintosh previously using a display at a resolution higher than 640x480, the monitor displays the higher resolution during the startup process. However, when the desktop displays the resolution resets to 640x480 and does not offer you the ability to change the resolution. To correct this, use the integrated ADB/video cable and restart your Macintosh.

If you are still only getting the 640 x 480 resolution, follow the troubleshooting steps below.

Troubleshooting Steps
=====

Step 1

Verify that all cables are securely connected.

Step 2

Verify the AppleVision extension is installed and loading at startup.

Step 3

Delete the preferences for the Finder and one or more of the following;

- Sounds & Displays prefs
- Monitors & Sound prefs
- Monitors
- Sound Preferences

Depending on the computer and version of Mac OS installed you will find one or more of these preference files in your Preference folder, which is located inside your System folder).

Step 4

Remove the existing AudioVision software and reinstall it.

Article Change History:

- 29 Jan 1997 - Added AppleVision to discussion, and revised pref files.
- 04 Jan 1996 - Added additional troubleshooting steps.
- 21 Dec 1995 - Changed the title to match the monitor name.

Modem Initialization Strings for MacPPP Access (10/96)

Revised: 4/21/97
Security: Everyone

Modem Initialization Strings for MacPPP Access (10/96)

Article Created: 24 August 1995
Article Reviewed/Updated: 2 October 1996

TOPIC -----

This article lists some modem initialization strings for MacPPP using point-to-point protocol (PPP) access. This article does not have initialization strings for every modem, only those which the modem vendor provided to Apple.

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

DISCUSSION -----

MacPPP ships with Apple Internet Connection Kit (AICK) and requires you to know your modem's initialization string. Many initialization strings are listed in the AICK setup, however, if your modem is not listed, you should consult your modem manual, or contact your modem vendor, or check with your Internet Service Provider.

Modem Initialization Strings for MacPPP Access (5/96)

Article Created: 24 August 1995
Article Reviewed/Updated: 20 May 1996

TOPIC -----

This article lists some modem initialization strings for MacPPP using point-to-point protocol (PPP) access. This article does not have initialization strings for every modem, only those which the modem vendor provided to Apple.

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

DISCUSSION -----

MacPPP ships with Apple Internet Connection Kit (AICK) and requires you to know your modem's initialization string. Many initialization strings are listed in the AICK setup, however, if your modem is not listed, you should consult your modem manual, or contact your modem vendor, or check with your Internet Service Provider.

Open Transport: Brief Review of Releases and Updates (5/96)

=====

Article Created: 24 August 1995
Article Reviewed/Updated: 27 May 1996

TOPIC -----

This document outlines Open Transport releases and updates.

DISCUSSION -----

Version 1.0 was the initial release of Open Transport and was included with early Power Macintosh 9500 computers.

The Open Transport 1.0.1 patch provides improved compatibility with PPP and SLIP software and other fixes, but it is strongly recommended that all Power Macintosh 9500 customers upgrade to version 1.0.6.

Version 1.0.6 is included with all new PCI-based Power Macintosh computers. Customers who previously bought a Power Macintosh 9500 can get an upgrade to the new software by calling the Apple Order Center.

The Open Transport 1.0.7 patch provides improved compatibility with PPP and SLIP software and other fixes.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the patch software updates mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

MacTCP & Open Transport: Maximum Simultaneous Connections-8/95

Revised: 8/24/95
Security: Everyone

MacTCP & Open Transport: Maximum Simultaneous Connections-8/95

Article Created: 24 August 1995

TOPIC -----

How many simultaneous IP connections can MacTCP handle? How many simultaneous IP connections can Open Transport handle?

DISCUSSION -----

MacTCP has a limit of 64 sockets. Simultaneous IP connections under Open Transport will be limited by installed memory and processor power. The following paragraph is from the Open Transport press release, dated 6/20/95:

"Version 1.0 of Open Transport offers backward compatibility with existing networking client applications and significantly upgrades the feature set and performance of TCP/IP on the Mac OS. With the overwhelming acceptance of TCP/IP protocols in the marketplace, and the tremendous excitement and visibility of the Internet, Apple has elected to bring a workstation-class implementation of TCP/IP protocols to the Mac OS. Support such as Dynamic Host Configuration Protocol (DHCP), for centralized IP address management; IP multicast, for participation as an MBone client; and simultaneous TCP connections limited only by installed memory and processor power, for increased functionality as an Internet or other TCP/IP network server are just a few of the new features. The architecture that supports Open Transport/TCP is itself based on a direct port of the Unix System V R4 STREAMS environment--a proven, robust and scaleable OS networking technology."

Power Macintosh 8500: TV Video Option Does Not Disappear (8/95)

Revised: 10/14/96
Security: Everyone

Power Macintosh 8500: TV Video Option Does Not Disappear (8/95)

=====

Article Created: 24 August 1995
Article Reviewed/Updated: 28 August 1995

TOPIC -----

On a Power Macintosh 8500, without a television connected to the Video Out, the option to output to television in the Sound and Displays control panel still appears. Because of this, the color options for higher resolutions such as 1152x870 do not provide a choice for millions of colors.

Why is the TV option available when no TV device is connected?

DISCUSSION -----

On the Power Macintosh 8500, the video out circuitry detects the presence of a television and the Mac OS determines the choices available for television output in the control panel. If a television is available, the Mac OS allocates some Video RAM (VRAM) for the TV output device and either mirrors the computer's main display or uses the television as a second monitor.

If the television or other video output device is not attached, but the TV option is available in Sound and Displays control panel, you need to open the unit to check the cable connection.

WARNING:

These directions are provided primarily for Apple Service providers. If you attempt to perform upgrades or repairs yourself, any damage you may cause to your equipment will NOT be covered by your warranty.

IMPORTANT:

Your computer contains electrically sensitive parts. To avoid damaging your computer, discharge static electricity that may be on your clothes or body by touching the power supply case before working with the assembly.

Examine the internal AV ribbon cable and make sure it is attached between the logic board and the external RCA video/sound connectors on the back panel of the

computer. The internal ribbon connector must be attached to the logic board for the detection circuitry to operate properly. If the cable is not connected properly to the logic board, the computer assumes a television is available. If the cable is not connected properly, reconnect the internal cable to correct this problem.

Article Change History:

28 Aug 1995 - Added Warning information and clarified the disscussion.

PowerShare Admin: Cannot Delete Inverse Group Name Alias (8/95)

Revised: 8/24/95
Security: Everyone

PowerShare Admin: Cannot Delete Inverse Group Name Alias (8/95)

=====

Article Created: 24 August 1995

TOPIC -----

I'm experiencing aliases with inverse group names in my PowerTalk catalog which I cannot be deleted from PowerTalk, and I cannot see (inverse alias names) in PowerShare. For example, the group address "Shipping & Receiving", I see an alias "Receiving, Shipping &" in the PowerTalk catalog. I do not, however, see this inverse group alias when using the PowerShare Admin application. How do I delete them?

DISCUSSION -----

Apple has been able to duplicate what you describe. After changing the name of an existing group address, PowerShare will generate an alias like it does with a personal address.

The workaround is to hold down the option key while clicking on Group in the pertinent catalog window. This will display all of the records and their aliases for that catalog folder, letting you select the errant alias and delete it by using the Delete Selected Objects command in the Edit menu.

Quadra/Centris 605/610/650/700:Frequently Asked Questions 11/95

Revised: 2/17/97
Security: Everyone

Quadra/Centris 605/610/650/700:Frequently Asked Questions 11/95

Article Created: 24 August 1995
Article Reviewed/Updated: 7 November 1995

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) on mid-range Quadra computers, including the Macintosh Quadra 605 and 700, and Macintosh Quadra/Centris 610 and 650.

Questions in this FAQ:
=====

- 1) What is an enabler and why do I need one?
- 2) What are the expansion options for the mid-range Macintosh Quadra computers?
- 3) How do I upgrade the memory on my Macintosh Quadra 605, 610, 650 and 700?
- 4) What is an FPU and does my computer have one?
- 5) What is 32-bit addressing and when does it need to be active?
- 6) What is "resetting the PRAM"? Do I need to do this often?
- 7) Rebuilding the desktop file: what is it and why would I need to do it?

DISCUSSION -----

- 1) Question: What is an enabler and why do I need one?

Answer: Rather than create a new version of the system software each time a new machine is released, Apple created system enablers. These enablers contain system software code specific to a particular Macintosh computer. Enablers provide older system software with the information necessary to run properly on a newly released Macintosh.

The Macintosh Quadra 605, 610, 650, and 700 computers do not require an enabler when using System 7.5 or later.

If you are using System 7.1 on these machines, you will need the following enablers:

Macintosh Quadra 605: System Enabler 065
Macintosh Quadra 610: System Enabler 040
Macintosh Quadra 650: System Enabler 040
Macintosh Quadra 700: no enabler

2) Question: What are the expansion options for the mid-range Macintosh Quadra computers?

Answer: On the mid-range Macintosh Quadra computers, Apple provided several expansion options. One type of expansion slot on all these computers is the processor-direct slot (PDS).

The PDS allows expansion cards to have direct access to the processor. Video, network and accelerator cards, among others, have been created for the PDS slots in Macintosh Quadra models.

Note: Because different Macintosh computers use different processors, there are several implementations of the processor-direct slot; not all PDS cards are compatible with the different PDS types. To ensure compatibility, contact the manufacturer of any PDS card you plan to use.

An additional NuBus expansion slot is present in the Macintosh Quadra/Centris 650 and Macintosh Quadra 700 computers. NuBus is a standard designed by Texas Instruments. It features self-configuration and bus-mastering on a 32 data-bit card. Bus-mastering means a card can take control of the bus, which allows for multi-processor computing. The card self-configures using on-board ROM (Read Only Memory).

The NuBus slot is a one-piece socket (female) connector with two rows of pins. The card has a plug (male) connector that plugs into the socket. This slot type is not compatible with any other slot standard.

Here are the expansion slots available on all mid-range Macintosh Quadra computers:

Macintosh Quadra 605: LC III compatible PDS
Macintosh Quadra 610: PDS or 7-inch NuBus card (requires adaptor)
Macintosh Quadra 650: one 68040 PDS and three NuBus expansion slots
Macintosh Quadra 700: one 68040 PDS and two NuBus expansion slots

3) Question: How do I upgrade the memory on my Macintosh Quadra 605, 610, 650 and 700?

Answer:

Begin_Table

System	RAM Soldered on Board	Number of SIMM Slots	Possible SIMM Sizes	Physical RAM Configs(MB)	Speed	Notes
Quadra 605	4	1	1MB,2MB,4MB 8MB,16MB, 32MB	4,5,6,8,12, 20,36	80ns	1,2,5
Quadra 610	4	2	4MB,8MB,16MB, 32MB	4,8,12,20,28, 36,40,44,52,68	80ns	1,2,4
Quadra 650	8	4	4MB,8MB,16MB, 32MB	8,12,16,20, 24,28,32,36,40, 44,48,52,56,60, 64,68,72,76,80, 84,88,92,96,104, 108,112,120,136	80ns	1,2,3, 4
Quadra 700	4	4	1MB,4MB	4,8,20	80ns	1

End_Table

NOTES:

1. These systems have 32-bit-clean ROMs. Computers with 32-bit-clean ROMs can take advantage of more than 8MB of physical RAM under System 7.

2. These systems use 32-bit wide, 72-pin SIMMs (fast-paged mode) not previously used in Macintosh computers.

3. The Centris 650, and Quadra 800 use "memory interleaving" which occurs when SIMM pairs are used (for example: two 8MB SIMMs). This allows the memory subsystem to perform certain operations faster. Basically, it allows the memory subsystem to write to the same memory address in different banks of memory before incrementing the address. Depending on how memory intensive the application, this can improve performance 5 to 10%.

4. The Centris/Quadra 610, Centris/Quadra 650, and Quadra 800 have flexible memory systems, meaning that any supported SIMM size can go into any SIMM socket in any order, and these computers can run with partially populated banks. They don't support 1MB, 2MB, or 64MB 72 pin SIMMs.

5. The Macintosh LC 475, Performa 475/476 and Quadra 605 are functionally similar and have the same RAM specifications.

4) Question: What is an FPU, and does my computer have one?

Answer: Floating-point Units (FPUs or math coprocessors), such as the 68881/68882, offer the greatest benefit in applications that tend to be very

floating-point (arithmetic) intensive. The specific types of applications that benefit most from an FPU are those that process large amounts of floating-point instructions for precision, and will utilize an FPU extensively. Examples are CAD/CAM, 3-D modeling, scientific applications, and financial applications.

Below is a listing of which Macintosh Centris & Quadra products have a Math Coprocessor (FPU) and which do NOT:

Quadra 605 (NONE of the configurations have an FPU)

Macintosh Centris 610 (NONE of the below configurations have an FPU)

M1345LL/A Macintosh Centris 610 4 MB Hard Disk 80 CPU (no Ethernet)
M1392LL/A Macintosh Centris 610 4 MB Hard Disk 80 CPU
M1397LL/A Macintosh Centris 610 8 MB Hard Disk 230 CPU
M1398LL/A Macintosh Centris 610 8 MB (1 MB VRAM) Hard Disk 230 CPU w/CD-ROM

Macintosh Quadra 610 (first two configurations below HAVE an FPU)

M2098LL/A Macintosh Quadra 610 (512K VRAM) 8 MB Hard Disk 230
M2099LL/A Macintosh Quadra 610 8 MB Hard Disk 230 w/CD-ROM

M2319LL/A Macintosh Quadra 610 (512K VRAM) 8 MB Hard Disk 160 (NO FPU)

Macintosh Centris 650 (first four configurations have an FPU)

M1613LL/A Macintosh Centris 650 8 MB Hard Disk 80 CPU
M1337LL/A Macintosh Centris 650 8 MB Hard Disk 230 CPU
M1279LL/A Macintosh Centris 650 8 MB (1 MB VRAM) Hard Disk 230 CPU w/CD-ROM
M1209LL/A Macintosh Centris 650 8 MB Hard Disk 500 CPU

M1276LL/A Macintosh Centris 650 4 MB Hard Disk 80 CPU (NO Ethernet or FPU)

Macintosh Quadra 650 (ALL configurations have an FPU)

Macintosh Quadra 700 (ALL configurations have an FPU)

If your Quadra 610 has no FPU and you wish to upgrade, you need to purchase a third-party upgrade kit, as Apple does not offer this upgrade.

5) Question: What is 32-bit addressing and when does it need to be active?

Answer: With 32-bit addressing, you can install and access more than 8MB of physical RAM in the Macintosh. This means you can work with very large data files, very large applications, or many applications concurrently. 32-bit addressing is most attractive to Macintosh users working with large memory-intensive programs. While virtually anyone can benefit from the large amount of memory offered by 32-bit addressing, it will immediately benefit database users, color-graphic users, CAD/CAM users, and programmers.

More technically speaking, 32-bit addressing lets most recent Macintosh models access the entire memory range of the microprocessor.

32-bit addressing is fully implemented in the Macintosh Quadra series. If more than 8 MB of memory (RAM) is installed, the 32-bit addressing option should be turned on in the Memory control panel. If, for example, 16 MB is installed on a Macintosh Quadra 650 and 32-bit addressing is off in the Memory control panel, the system software will appear to take up most of the available memory. The solution to this situation is to activate 32-bit addressing in the Memory control panel and restart.

6) Question: What is "resetting the PRAM"? Do I need to do this often?

Answer: The parameter RAM (PRAM) is used to keep many settings for the Macintosh. The PRAM keeps track of the date, time, status of serial ports, which printer has been chosen in the Chooser and numerous other settings.

Occasionally, a corrupt setting in the PRAM can adversely affect the operation of the computer. Resetting the PRAM can sometimes return the computer to its normal state.

There is no need to reset the PRAM on a regular, scheduled basis.

To reset the PRAM, restart the computer with the following keys held down at the same time: Command, Option, P and R. Continue holding these keys down until you hear the computer restart (or the screen image flash) at least three times. Let go of all the keys and allow the computer to start up.

7) Question: Rebuilding the desktop file; what is it and why would I need to do it?

Answer: The Desktop file is an invisible file found in the main level of your hard drive. It is the file that keeps track of all the documents and applications that are on your hard drive.

The file name is Desktop for versions of System 6 and earlier. System 7.0 and later versions use the invisible files named Desktop DB and Desktop DF.

Occasionally your Desktop file may become too large or may be damaged.

One symptom of a damaged Desktop file is the icons on your desktop appear as "generic" rather than "custom" icons. The Desktop file manages all icons on a particular hard drive or floppy disk. When you insert a new or customized icon, the Desktop file may not load it or may load a previous version of the icon. To have the special icon appear on the desktop, the Desktop file must be rebuilt to update the Desktop file and register the icon.

Icons change to generic document (blank page with a corner turned down) or application (diamond with a hand) icons for several reasons, including the following:

- * Utilities such as compression or security software can alter icons.
- * Custom icons become damaged or deleted.
- * The Desktop file has been damaged.

- * Applications that create files may not assign icons to the files.
- * An application that created a file and assigned an icon may no longer be available.
- * A file may have lost the bit that indicates a custom icon (this is known as the bundle bit).

If the Desktop file becomes too large, the computer may have difficulty reading it efficiently and speedily. This can cause the Finder to access files more slowly. Rebuilding the Desktop file can clean up old information and speed up Finder access.

You can also make a file-by-file backup of the drive, re-initialize the drive, and then restore the files. This re-groups all the files, defragments them, and increases the efficiency of the drive.

To rebuild the desktop using System 7.0 through System 7.1.2, follow these steps:

Step 1

Hold the Shift key down while starting up the computer.

Step 2

As soon as you see "Welcome to Macintosh Extensions Off", release the Shift key and hold down the Command and Option keys.

Step 3

Continue pressing the Command and Option keys until you see the dialog that says "Are you sure you want to rebuild your desktop on your disk? All of your info window comments will be lost," release the keys and click OK.

Step 4

Let go of the keys and click on the OK button.

After the desktop has been rebuilt, restart the computer, and all extensions and control panels will be active again.

To rebuild the desktop using System 7.5 or above, follow these steps:

Step 1

Before you rebuild your desktop, use the Extensions Manager to save a record of the extensions that are currently turned on.

- Open the Extensions Manager.
- Open the Sets pop-up menu, and choose Save Set.
- When the Save Set dialog box opens, type a name for your currently selected extensions (for example, 'My Extensions'). When you close the dialog box, the name of your set is added to the Sets pop-up menu.

Step 2

Open the Sets pop-up menu again and choose All Off.

Step 3

Find Macintosh Easy Open in the list of Control Panels and click it to put a checkmark beside it. Close the Extensions Manager.

Step 4

Restart your computer while holding down the Command and Option keys.

Step 5

When you see the dialog that says "Are you sure you want to rebuild your desktop on your disk? All of your info window comments will be lost," release the keys and click OK.

Step 6

When the desktop is rebuilt, open the Apple menu and choose Control Panels.

Step 7

Open the Extensions Manager control panel.

Step 8

Open the Sets pop-up menu and choose the name you gave your set of extensions in step 1 (for example, 'My Extensions').

Step 9

Restart your computer to activate the extensions.

ColorSync 2.0: Missing/Incompatible Profiles on MS 15 (8/95)

Revised: 8/24/95
Security: Everyone

ColorSync 2.0: Missing/Incompatible Profiles on MS 15 (8/95)

=====

Article Created: 24 August 1995

TOPIC -----

A version of the ColorSync 2.0 Profile for the Multiple Scan 15 Display has been reported to be incompatible with some applications or it may be missing from the system software that comes with your computer. The following article describes the solution.

DISCUSSION -----

- Some customers may experience problems with the use of an early version of the ColorSync 2.0 Profile for the Multiple Scan 15 Display. These customers are reporting that within some applications (such as Photoshop), an error message is being produced which reports the monitor's settings are invalid. In these same configurations, other profiles are working fine and other applications are not having errors with this same ColorSync 2.0 Profile.

- Some Apple computers, including the Power Macintosh 7200, 7500, 8500, and 9500 series computers, did not ship with the ColorSync 2.0 Profiles installed for the Apple Multiple Scan 15 display.

In both of these situations customers may call asking about obtaining a new ColorSync Profile for the Multiple Scan 15 Display. This profile has been updated and rolled into the version of the currently posted version of ColorSync 2.0 Rev. The "Apple Multiple Scan 15" profile has a modification date of May 31, 1995 while all other ColorSync profiles have a modification date of Mar 23, 1995.

Color LW 12/600 PS: Print Longevity (8/95)

Revised: 8/24/95
Security: Everyone

Color LW 12/600 PS: Print Longevity (8/95)

=====

Article Created: 24 August 1995

TOPIC -----

How sensitive to light is the toner in the Color LaserWriter 12/600? Is it rated as "archival materials" or "light fast"? What other information is available about storing these prints?

DISCUSSION -----

The following information about light sensitivity and proper storage environment was obtained from the vendor that supplies the toner products for the Color LaserWriter 12/600 PS.

- The color fades very slightly under normal room light. But if you plan to keep the color printouts for a long period (more than 2 years), put them in a binder. (Sometimes the color appears to change when in fact it is a color change in the paper itself.)
- Do not store color printouts together with PVC (polyvinyl chloride) materials such as a clear holder. The toner may melt, causing the paper and the PVC materials to stick together.
- Use only non-solvent glues to glue color printouts together.
- Solvents will dissolve the toner. Before using a glue, test it on unwanted printouts.
- Before inserting any color printout between printed pages, make sure the pages are completely dry; otherwise the ink on those printed pages may cause the toner to melt.
- Store color printouts flat. If they are folded or wrinkled, the toner may come off.
- Store color printouts in at room temperature. High temperature will cause the toner to melt and colors to mix.

NOTE:

The longevity of printed materials can be affected not only by the environment (light, temperature and chemical exposure), but also by the quality and makeup of the paper supporting the image. The above applies only to the color toners.

Understand that there will be archival differences in the color toners (yellow, magenta, cyan and black); the color layers will probably fade at the different rates. While manufacturers can provide rough estimates on the longevity of their products, they must base such numbers on accelerated tests that may not have an accurate correlation to the real-world storage conditions.

Performa 630CD:Freezes At Start Up Due To Wrong SIMM Type (8/95)

Revised: 8/24/95
Security: Everyone

Performa 630CD:Freezes At Start Up Due To Wrong SIMM Type (8/95)

=====

Article Created: 24 August 1995

TOPIC -----

I have a Macintosh Performa 636CD computer. Since I installed a RAM upgrade, the machine boots to a frozen gray screen. I put the same kind of double banked SIMMs in both slots. What is wrong?

DISCUSSION -----

The second SIMM socket can only accept single banked SIMMs, that is, 1MB, 4 MB, and 16 MB. You cannot use double banked SIMMs in the second slot. You can only use double banked SIMMs in the first slot. To fix the problem remove the double banked SIMM from the second slot and restart the computer.

Apple Remote Access: Extending Default Time Out Limit (8/95)

Revised: 8/25/95
Security: Everyone

Apple Remote Access: Extending Default Time Out Limit (8/95)

=====

Article Created: 25 August 1995

TOPIC -----

I'm trying to make an Apple Remote Access (ARA) connection to a ARA MultiPort (MP) Server that takes a very long time to respond. After about 50 seconds, which seems to be the ARA default time out, I get a message that the connection attempt has failed. Is there any way to extend the 50 second time out limit?

DISCUSSION -----

The time that ARA will wait to establish a connection is set in the CCL (command control language) script for a particular modem. The CCL script can be modified to change that limit, and CCL script editing tools are available from APDA.

Another way to change the time limit is by including some commas to the end of the dialing string. Every comma attached to the end of the number will add approximately 2 seconds to the amount of time ARA will wait before it assumes the connection will not establish itself. Below is an example:

Number: 5551234,,,,,,,,,

This dialing string will add approximately 20 seconds to the default time, which is usually 50 seconds.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the APDA address and phone number.

Power Macintosh 9500 Series: Video Card Scan Rates (1/97)

Revised: 1/7/97
Security: Everyone

Power Macintosh 9500 Series: Video Card Scan Rates (1/97)

Article Created: 25 August 1995
Article Reviewed/Updated: 7 January 1997

TOPIC -----

This article describes the video scan rates for the Apple Accelerated Graphics card that ships with the Power Macintosh 9500 Series computers.

DISCUSSION -----

The Power Macintosh 9500 Series computers include the Apple Accelerated Graphics Card, based on the mach64 Graphics Accelerator card from ATI Technologies, Inc. The card normally includes 2MB of VRAM (expandable to 4MB via a 2MB VRAM daughter board) and supports resolutions from 512 x 384 to 1,280 x 1,024. The Monitors control panel reads the display sense codes and may not show every scan rate listed below.

Following are the video scan rates supported by the Apple Accelerated Graphics card in the Macintosh 9500/120:

Begin_Table

Mode	Resolution	Vertical	Horizontal
----	-----	-----	-----
VGA	512 x 384	60 Hz	24.4 KHz
VGA	640 x 480	60 Hz	31.5 KHz
Mac	640 x 480	66.7 Hz	35 KHz
Mac	640 x 870	75 Hz	68.8 KHz
SVGA	800 x 600	56 Hz	35 KHz
VESA	800 x 600	60 Hz	37.9 KHz
VESA	800 x 600	72 Hz	48 KHz
VESA	800 x 600	75 Hz	46.8 KHz
Mac	832 x 624	74.5 Hz	49.7 KHz
VESA	1024 x 768	60 Hz	48.4 KHz
Mac	1024 x 768	74.9 Hz	60.2 KHz

VESA	1024 x 768	70 Hz	56.5 KHz
VESA	1024 x 768	75 Hz	60 KHz
Mac	1152 x 870	75 Hz	68.7 KHz
VESA	1280 x 960	75 Hz	75 KHz
VESA	1280 x 1024	60 Hz	65.6 KHz
VESA	1280 x 1024	75 Hz	80 KHz

End_Table

Note:

The Power Macintosh 9500/132 computer does not ship with the Apple Accelerated Graphics Card. The Power Macintosh 9500/132 requires a third-party (non-Apple) graphics accelerator for display support.

Intelligent Battery Recondition Software: Read Me (8/95)

Revised: 8/30/95
Security: Everyone

Intelligent Battery Recondition Software: Read Me (8/95)

=====

Article Created: 28 August 1995
Article Reviewed/Updated: 30 August 1995

TOPIC -----

The following article is the ReadMe file for the Intelligent Battery Recondition Software.

DISCUSSION -----

This document provides information about the Intelligent Battery Recondition software. It is a good idea to read this document now, and keep a copy handy for future reference.

If your PowerBook is connected to a printer, choose Print from the File menu to print a copy of this Read Me. When you are finished reading and printing this Read Me, choose Quit from the File menu to quit the SimpleText application program.

What is the Intelligent Battery Recondition software?

=====

The batteries of the PowerBook 500 series computers are "intelligent", which means they have a small microprocessor in them that monitors the battery's status. The system software communicates with the microprocessor and uses the information stored inside it to tell you how much time is left, if the battery is charging, etc. Under certain conditions, the information stored in the battery can become corrupted and cause the system software to incorrectly report the battery status. The Intelligent Battery Recondition software updates this information in the battery and restores normal operation. This software only works on the PowerBook 500 series computers.

Installing the Intelligent Battery Recondition software

The Intelligent Battery Recondition software consists of two parts:
a system extension ("Intelligent Battery")
an application ("Intelligent Battery Recondition").

To install the Intelligent Battery extension, follow these steps:

Step 1

Drag the extension to the Extensions folder (in the System folder) on your PowerBook's hard disk.

Step 2

Restart your PowerBook.

To install the Intelligent Battery Recondition application, do this:

- Drag the Intelligent Battery Recondition application to your PowerBook. You can copy the application anywhere on your PowerBook's hard disk.

When should I use the Intelligent Battery Recondition application?

You should use the Intelligent Battery Recondition application if your PowerBook fails to recognize an installed battery or when a battery will not charge. You can tell if the PowerBook recognizes an installed battery by looking at the battery monitor module in the Control Strip.

If one of these situations occurs, then you need to run the Intelligent Battery Recondition application:

- A battery is installed in the right battery bay and you see something like the following in the battery monitor module:
- A battery is installed in the left battery bay and you see something like the following in the battery monitor module:
- At least one battery installed and you see something like the following in the battery monitor module:

Using the Intelligent Battery Recondition application

To use the Intelligent Battery Recondition application, do this:

Step 1

Make sure the battery you want to update is in the right hand battery bay.

Step 2

Double-click the Intelligent Battery Recondition application icon and follow the on screen instructions. You'll be instructed to insert batteries into the right

hand battery bay.

It takes from 7 to 12 minutes to complete the update process. Do not interrupt the application while it is running. Watch for dialogs that require action on your part. Progress messages appear in the Intelligent Battery Recondition application window.

A message appears on the screen telling you when the update process is finished. Click OK to finish the process and automatically quit the application.

IMPORTANT You can quit the application at any time, but quitting before the update process is complete may cause the battery to behave unpredictably.

The application can only update the battery in the right hand battery bay, so if your PowerBook has a battery in the left battery bay, or you have extra batteries for your PowerBook, follow the steps above for each battery.

Getting help

If you find that your batteries aren't performing correctly after using the Intelligent Battery Recondition software, contact your Apple-authorized service provider or call the Apple Assistance Center at 1-800-SOS-APPL.

Security: Everyone

Megaphone: -17 Error Message (9/96)

=====

Article Created: 28 August 1995
Article Reviewed/Updated: 10 September 1996

TOPIC -----

When I try to open the Megaphone telephony application, I get an error message that says "An error occurred opening the sound recording driver; an unexpected error has occurred (-17)". Megaphone quits and I go back to the Finder. What should I do?

DISCUSSION -----

Cypress Technologies, the makers of Megaphone, recommend the following to fix this issue caused by one or more corrupted files:

Step 1

Open the System Folder on your hard drive.

Step 2

* Global Village Teleport Platinum V Modems:

Open the Preferences folder. Drag the following items to the Trash:

- Cypress Folder

NOTE:

If you wish to retain your contacts, open the Cypress folder and the MegaPhone folder and move the CONTACTS file to the desktop. After restarting the computer, drag the Contacts file back to the System - Preferences - Cypress - MegaPhone folder and replace the new file.

Also, if you want to keep your recorded inbound calls, you should move Voice Mail Sounds out of your System Folder completely and store it some place else on

your hard drive. Voice Mail Sounds contains previously recorded calls. If you trash the file, you will lose recorded calls.

- Sound Preferences

* Global Village Telport Gold IIV Modems:

Open the Preferences folder. Drag the following items to the Trash:

- Cypress Folder

NOTE:

If you wish to retain your contacts, open the Cypress folder and the MegaPhone folder and move the CONTACTS file to the desktop. After restarting the computer, drag the Contacts file back to the System - Preferences - Cypress - MegaPhone folder and replace the new file.

Also, if you want to keep your recorded inbound calls, you should move Voice Mail Sounds out of your System Folder completely and store it some place else on your hard drive. Voice Mail Sounds contains previously recorded calls. If you trash the file, you will lose recorded calls.

- Sound Preferences

- Telport Gold Tool Prefs

Step 3

Close the Preferences folder.

Step 4

Open the Extensions folder (within the System Folder).

Step 5

* Global Village Teleport Platinum V Modems:

Drag the CRC Teleport Teltool file to the Trash.

* Global Village Telport Gold IIV Modems:

Drag the Telport Gold IIV Teltool to the Trash

Step 6

Close any open windows and insert the Performa system software CD-ROM disc.

Step 7

From the System Folder on the Performa CD, open the Extensions folder.

Step 8

Drag the CRC Telport Teltool file (Platinum V modems) or Telport Gold IIv Teltool file (Gold IIv modems) from the Extensions folder on the Performa CD to the Hard Disk icon.

Step 9

Close all open windows except for the Hard Disk.

Step 10

Drag the CRC Teleport Teltool file (Platinum V modems) or Telport Gold IIv Teltool file (Gold IIv modems) to the System Folder. You will get a message stating that Extension files belong in the Extensions folder. Click OK.

Step 11

Close all windows and choose Restart from the Special menu. When the computer has restarted Megaphone is ready to use.

Macintosh Performa 6100 Series: Low Sound Volume (8/95)

Revised: 8/28/95
Security: Everyone

Macintosh Performa 6100 Series: Low Sound Volume (8/95)

Article Created: 28 August 1995

TOPIC -----

The sound level from the internal speaker seems low on my Macintosh Performa 6100 series computer. What is causing this and what can I do to get higher volume?

DISCUSSION -----

You should first check the volume levels in the Sound control panel. Open the Sound control panel and adjust the volume in both the Alert sounds and Volumes options.

The internal speaker is located directly underneath the computer. Make sure that your computer is on a flat surface with no obstructions. Paper or other material directly under the computer can dampen the sound.

Another way to get louder sound is to connect external speakers. Many monitors have speakers that can be connected to the audio-out port of your computer.

The following computers are in the Macintosh Performa 6100 series: Performa 6110, Performa 6112, Performa 6115, Performa 6117, and Performa 6118.

TOPIC -----

Which Macintosh computers can be upgraded to the Power Macintosh 8500/120?

DISCUSSION -----

The following table lists the Macintosh computers that can be upgraded to the Power Macintosh 8500/120 via a logic board upgrade:

Begin_Table

Quadra 800
Quadra 840AV
Workgroup Server 80
Workgroup Server 8150
Power Macintosh 8100/80
Power Macintosh 8100/100
Power Macintosh 8100/110

End_Table

Order No. M3807LL/A

NOTE: This upgrade will not be available until 2 months after the introduction date of the Power Macintosh 8500 series computers.

QuickTime 2.0.x: 8-Bit Movies Play Poorly In 24-Bit Mode (8/95)

Revised: 8/29/95
Security: Everyone

QuickTime 2.0.x: 8-Bit Movies Play Poorly In 24-Bit Mode (8/95)

=====

Article Created: 28 August 1995

TOPIC -----

I am having problems playing back 8-bit (256 color) QuickTime movies with QuickTime 2.0 using Millions of colors (24-bit). All of the QuickTime movies were created using QuickTime 1.5 or 1.6. If I switch back to QuickTime 1.6, the movies play back properly. I have installed the Apple Multimedia Tuner, but this did not help.

DISCUSSION -----

There is a known problem with QuickTime 2.0 and Power Macintosh computers using 24-bit display depths when playing back 8-bit movies.

This problem has been fixed in QuickTime 2.1, you need to use QuickTime 2.1 to correctly play 8-bit movies on a 24-bit display.

DOS Compatibility Card: Video Signal Brighter In Windows (8/95)

Revised: 9/29/95
Security: Everyone

DOS Compatibility Card: Video Signal Brighter In Windows (8/95)

=====

Article Created: 25 August 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

I am using a DOS Compatibility Card with a Multiple Scan 17 Display. Everything seems to work okay in the Macintosh and DOS environments, but when in the Windows environment, all lines are distorted. In particular, vertical lines tend to "bleed" to pink and then white. Only black shows up properly.

DISCUSSION -----

Here is some background that explains the nature of the problem and provide a reasonable workaround

Background
=====

The video signal for the DOS/Windows image is actually brighter than the Macintosh image to compensate for the dark image quality that Windows has. The poor image quality of Windows was confirmed by original beta testers for the DOS Compatibility Card. The beta users complained about Windows not being as bright and "crisp" as the Macintosh image. To compensate, the DOS video signal has actually been adjusted so it is brighter (greater signal strength) than the Macintosh video image.

In some cases though, the adjusted difference in brightness can be seen and the Windows video can slightly overdrive the display. The increased video signal strength may create streaks or ghosts of color around icons and other objects in the Windows video image.

Workaround
=====

In configurations where there is ghosting, color streaks or outlines in the Windows video image: switch to Windows; adjust the contrast control of the

display down to minimize contrast (this should remove the ghosting or streaks);
increase or adjust the brightness for an acceptable display image brightness.

This adjustment should provide an acceptable display for both Macintosh and
Windows images.

RAM: Difference between 2x32 and 2x36 SIMMs (8/95)

Revised: 8/29/95
Security: Everyone

RAM: Difference between 2x32 and 2x36 SIMMs (8/95)

=====

Article Created: 29 August 1995

TOPIC -----

I want to upgrade the random-access memory (RAM) in my Macintosh. I know I need to buy a 72-pin Single Inline Memory Module (SIMM), 80 nanoseconds (ns) or faster. While shopping for memory I have found two different types of SIMMs — those composed of a 2x32 chip set and those composed of a 2x36 chip set. What type of SIMM should I use in my Macintosh computer?

DISCUSSION -----

SIMMs composed of a 2x32 chip set have two chips representing 32 bits each. This totals 64 bits, which, divided by 8, results in 8 planar levels. This is the type of memory for which your computer is designed.

SIMMs composed of a 2x36 chip set have two chips representing 36 bits each. This totals 72 bits, which, divided by 8, results in 9 planar levels, indicating that the chip is a parity SIMM. This type of SIMM may also be used in your computer, but the extra bit offers no advantages.

Some older computers used the extra bit to verify the integrity of data transfer. This type of error checking is no longer widely used. The last Macintosh computer to use any type of parity memory was the Macintosh IIfx.

If you use parity RAM, your computer does not perform any differently. Your computer ignores the ninth bit.

MAE 2.0: Error Code 1 on HP Installing STREAMS (8/95)

Revised: 8/29/95
Security: Everyone

MAE 2.0: Error Code 1 on HP Installing STREAMS (8/95)

Article Created: 29 August 1995

TOPIC -----

I get an error code 1 on my Hewlett Packard (HP) workstation when trying to build the kernel while installing STREAMS for MAE. Here is what is happening:

```
/bin/ld: Unsatisfied Symbols
hp_dlpi_intr_plabel (data)
hp_dlpi_wakeup)plabel (data)
error code 1.
```

DISCUSSION -----

Your workstation has an early version of HP-UX. When you upgraded to a newer version of HP-UX, you updated, rather than do a complete installation. There are two different versions of the liblan.a library that needed to exist in early HP-UX 9.0. This was due to dlpi being released as part of STREAMS and STREAMS was an ISU in 9.0.

The workaround, for STREAMS, is to break into a temporary shell during the 9.0 update, use vi on the dfile file to delete the "dlpi" line, and exit the temporary shell to continue the update. At this point, the kernel should build properly.

To get dlpi back into your system, you need to re-install the STREAMS-DLPI files from the STREAMS' product tape. However, re-installation the whole STREAMS product set would be beneficial.

NOTE: There is no way to break into a temporary shell to assist in updating the AppleTalk Kernel Modules. There is no workaround, other than completely installing a later version of HP-UX.

If you have additional questions, please contact Hewlett Packard directly. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

What is Binhex & Where To Obtain It (9/95)

Revised: 9/26/95
Security: Everyone

What is Binhex & Where To Obtain It (9/95)

Article Created: 29 August 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

This article describes what Binhex is and where to obtain it.

DISCUSSION -----

Binhex is both a set of application utilities and storage protocols developed by Yves Lempereur in 1984 and 1985. You can find Binhex at the following ftp sites:

ftp.bio.indiana.edu
/util/mac/binhex.bin
(F binhex.bin 7k)

ftp.cc.utexas.edu
/depts/AI_ATTIC/HelpDownloading/MacCompactors/BinHex/binhex.bin
(F binhex.bin 7k)

Why Binhex

The basic idea behind Binhex is to translate a binary representation of data -- which could be an application program, graphical image, sound, and so on -- into an encrypted text representation of that file.

There are two reasons for doing this:

- Many mail programs used on the Internet cannot handle binary transmissions. They were designed for use with text data. So, an application is "binhexed" and included as the text component of the message.
- Many mail programs and gateways have size limitations, often less than 50K, and it is sometimes necessary to use an editor to split or combine such files. Since mail header information makes the automatic joining of files difficult;

Binhex allows common text editors to be used to join and manipulate such files.

How can you tell if it's a Binhex file

Binhex 4.0 files have a suffix of ".hqx". Binhex 2.0 files have a suffix of ".hex". Binhex 4.0 has been out since 1985, and it is very rare to see any ".hex" files anymore.

A Binhex file can be identified by the first line of the file:

(This file must be converted with Binhex 4.0)

This line is followed by one blank line, followed by the start of the data:

:%0bBA0SG(0d,Qe`CbdI0\$Bi!%e348GY69"(!*!\$",!!N!92!J!!!E-2!,35rrr

The data block begins and ends with a colon.

What are the versions of Binhex

Both versions of Binhex are freeware.

Binhex 4.0 simply converts files into Binhex encoded files and back to the file format it was before.

Binhex 5.0 is a bit more complicated because it deals with "MacBinary" documents. It does not deal with Binhex 4.0-encoded files.

What is a MacBinary document

Macintosh files have two components, a data fork and a resource fork. In addition, they have header information specific to the file system, plus additional information which is stored in the Desktop database. Binhex 4.0 documents take all of this into account, when transferring data from system to system.

But suppose you wish to upload a file to a non-Macintosh computer? Binhex files tend to be larger than the equivalent Macintosh file. In addition, when you manipulate them, you have to go through the encryption and decryption process on each end (upload and download) which can be time consuming, especially if you download many files. The solution is to originally upload the file as a "MacBinary" file, it would be stored online as a simple binary file.

Once it is downloaded, if your communications software supports MacBinary, the file would automatically be re-assembled into a Macintosh file or application. However, if you did not have this kind of communications program -- for example, you download the file to a PC, and then transfer the file to a Macintosh using PC Exchange -- you will have a generic binary document which SimpleText may try to open and produce nonsense.

Binhex 5.0 is intended to address this issue. It converts binary documents back into Macintosh applications or files. It does not translate Binhex 4.0 files. There is, therefore, no advantage to using Binhex 5.0 unless you are facing this

unique transfer problem.

Since most online services and communications software will automatically perform MacBinary transmissions (or at least allow the user to select that as an option), it is not generally not necessary to use Binhex 5.0.

UUencode and UUdecode

UUencode and UUdecode were derived in the UNIX environment, and perform a similar function to Binhex 4.0 encryption; they convert raw binary into an alternate text representation. This format is generally not suitable for transferring Macintosh applications, because it does not address differences between resource and data forks, or Desktop issues. In effect, you will only be dealing with information in the data fork.

UUencode and UUdecode are, however, widely used on both UNIX and PC systems, and they are standards. It is likely a user will deal with this format to process data which only has a data fork.

Article Change History:

26 Sep 1995 - Add where to obtain Binhex.

07 Sep 1995 - Corrected typographical error.

Apple Guide: Wrong Recording Sound Guide on 7500/8500 (8/95)

Revised: 8/29/95
Security: Everyone

Apple Guide: Wrong Recording Sound Guide on 7500/8500 (8/95)

=====

Article Created: 29 August 1995

TOPIC -----

I have a Power Macintosh 7500 computer and I was using Apple Guide to show me how to record a sound. Several steps into the process it asks me to locate the Sound control panel. When I tell it to help me, Apple Guide reports that the Sound control panel does not exist and I should install it from my Macintosh CD. I have been unable to find the Sound control panel anywhere on the compact disc that came with my computer.

DISCUSSION -----

The Apple Guide file that shipped on the Power Macintosh 7500 and 8500 computers has information on how to use the Sound control panel used on earlier System 7 Macintosh computers. The Power Macintosh 7500 and 8500 computers have replaced both the Sound and Monitors control panels with the single Sound & Display control panel. You selected "How do I...record a sound" in the Macintosh Guide window.

You can access the correct Macintosh Guide instruction set by following these steps:

Step 1

Click on the black question mark (?) on the yellow button in upper right corner of your screen and choose Macintosh Guide.

Step 2

Click the Look For button in the upper right corner of the Macintosh Guide window.

Step 3

Type "sound" in the text entry field on the left side of the Macintosh Guide

window, press return to start searching.

Step 4

Double-click the "How do I...install or remove an alert sound" phrase.

Macintosh Guide will now walk you through the correct procedures for using the SimpleSound application (in your Apple Menu) and the Sound & Displays control panel to work with sound on your Macintosh.

MegaPhone for Performa: Telephone Manager Required Message 8/95

Revised: 8/29/95
Security: Everyone

MegaPhone for Performa: Telephone Manager Required Message 8/95

=====

Article Created: 29 August 1995

TOPIC -----

I have a Macintosh Performa 6200 computer. When I try to open MegaPhone, I get an error message that states: "Telephone Manager 2.0 (or later) is required. Please install the software before launching Megaphone." However, the Telephone Manager Extension is present in the Extensions folder and has not been disabled by the Extensions Manager. What should I do next?

DISCUSSION -----

When the MegaPhone software is installed in your System Folder it places additional invisible resources inside the System suitcase in order to support the Telephone Manager on Performa 5200 and 6200 computers. If you have reinstalled system software using the Restore System Software feature of your Performa CD or a standard System 7.5 upgrade kit, you will no longer have these resources in your system suitcase. When an unaltered System 7.5 system suitcase is present, you will get this error message when you open MegaPhone.

To resolve this issue, you have two options:

Option 1

=====

Replace the System suitcase in your System folder with the System suitcase from your Macintosh Performa CD:

Step 1

Insert the Performa CD-ROM disc.

Step 2

Under Special, choose Shut Down.

Step 3

Hold down the "c" key (lower-case C; if you have a keyboard with a physical latch for the Caps Lock key, make sure the Caps Lock key is in the "up" position).

Step 4

Startup your computer.

Step 5

Hold down the "c" key until you see Welcome to Macintosh.

The computer will take longer than normal to start up. When it is finished starting up, the Trash icon will appear on the screen.

The Performa CD icon will appear in the upper right hand corner of the screen. Your hard disk or Macintosh HD icon should be right below the CD icon.

Step 6

Double-click the Hard Disk Files folder on your Performa CD.

Double-click the System Folder Files folder in the Hard Disk Files folder.

Step 7

Drag the System Suitcase from the System Folder Files folder on your Performa CD to the System Folder on your hard drive. When asked if you want to replace the item that already exists, click OK. Make sure the System suitcase is loose in the System folder and that you have not dragged it into another folder in the System folder.

Step 8

Restart your Macintosh, hold the eject button on your CD-ROM Drive to eject the Performa CD. MegaPhone is now ready to use.

Option 2

=====

Restore your system software by selecting the "Restore All Software" option from your Macintosh Performa CD, following the instructions in your Macintosh Performa User's Guide.

Be sure not to choose the "Restore System Software" option. This will install a regular version of the System suitcase; this version will not include the necessary extra Telephone Manager resources.

Note: Before replacing your System suitcase by using either method, double-click on it to see whether you have recorded any alert sounds. If you have, be sure to move them out of the System suitcase before trashing or replacing the suitcase. After you have finished restoring, you can move them into the new suitcase.

Disk Manager 4.0.3: Incompatible With System 7.5.2 (8/95)

Revised: 8/29/95
Security: Everyone

Disk Manager 4.0.3: Incompatible With System 7.5.2 (8/95)

=====

Article Created: 29 August 1995

TOPIC -----

I'm having problems installing System 7.5.2 on a third party hard drive. I'm using Disk Manager Mac 4.0.3 to format the hard drive. What am I doing wrong?

DISCUSSION -----

Ontrack Computer Systems, Inc. (the manufacturer of Disk Manager Mac) reports that Disk Manager Mac is not compatible with System Software version 7.5.2.

No additional information is available at this time.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

At Ease 2.0.3: ReadMe File (8/95)

Revised: 8/29/95
Security: Everyone

At Ease 2.0.3: ReadMe File (8/95)

=====

Article Created: 29 August 1995

TOPIC -----

This article contains the Read Me file that shipped with At Ease 2.0.3.

DISCUSSION -----

USING AT EASE 2.0.3

This update lists important changes in version 2.0.3 of At Ease and adds information about new features. The update addresses the following topics:

- Installing and upgrading At Ease 2.0.3
- New features
- Using At Ease 2.0.3 with System 7.5
- Using At Ease 2.0.3 for Workgroups
- Tips for using At Ease 2.0.3

For additional information, consult the At Ease 2.0 Owner's Guide or the At Ease 2.0 for Workgroups Administrator's Guide.

INSTALLING AND UPGRADING AT EASE 2.0.3

The following sections give you important information about installing At Ease 2.0.3 and upgrading to At Ease 2.0.3.

Do you have the original At Ease disks?

If you have the original disks for At Ease 2.0.3 or At Ease 2.0.3 for Workgroups, use the Installer program that came with the software to place At Ease and Mouse Practice on your hard disk. See the At Ease 2.0 Owner's Guide or the At Ease 2.0 for Workgroups Administrator's Guide for installation instructions.

If you have problems installing At Ease on 2-megabyte (MB) systems, you can make

more memory available by temporarily turning off all extensions. To do so, restart your computer and hold down the Shift key while it is starting up.

Do you have the At Ease 2.0.3 Updater disk?

If you have the At Ease 2.0.3 Updater disk for At Ease 2.0.3 and At Ease 2.0.3 for Workgroups, use the Updater program on that disk to update your earlier version of At Ease to At Ease 2.0.3 or At Ease 2.0.3 for Workgroups.

Upgrading from At Ease 1.0 to At Ease 2.0.3

If you have At Ease version 1.0, you must first obtain and install At Ease version 2.0 or 2.0.1 before you can install and use At Ease 2.0.3 using the At Ease 2.0.3 Updater disk. Once you have installed version 2.0 or 2.0.1, open the At Ease Setup program. If you created a password in At Ease 1.0, you are asked to enter it as the administrator's password when you open the program. If you have At Ease for Workgroups, a new setup called "At Ease 1.0" appears in the setup list, along with a new user also called "At Ease 1.0." You can rename the user or the setup if you wish. Then turn on At Ease and restart your Macintosh.

When you restart with At Ease turned on, all items that appeared on the At Ease 1.0 Items panel appear on the At Ease 2.0 or 2.0.1 Items panel. You can use the At Ease Setup program to remove items. Initially, the user panel is empty; as users create new items, buttons for these items will appear on the panel.

Now that you have installed At Ease version 2.0 or 2.0.1 on your system, follow the instructions in the next section, "Upgrading from At Ease 2.0 or 2.0.1 to At Ease 2.0.3."

Upgrading from At Ease 2.0 or 2.0.1 to At Ease 2.0.3

If you have At Ease version 2.0 or 2.0.1 on your hard disk, it is automatically upgraded to At Ease 2.0.3 when you use the Updater program that came with version 2.0.3.

To update to At Ease 2.0.3:

1. Turn on your Macintosh.
2. Insert the At Ease 2.0.3 Updater disk.
3. Double-click the Updater icon.
After a few moments, the Updater screen appears.

4. Click Begin.
Some At Ease files are automatically updated.

5. A screen then appears asking you to locate At Ease Setup. Select the At Ease Setup program, then click Update.

After a few moments, updating is complete. You are now ready to use At Ease 2.0.3 or At Ease 2.0.3 for Workgroups.

Note: You cannot use an earlier version of At Ease once you've updated to At Ease 2.0.3. The earlier version won't be able to read the preferences file created by At Ease 2.0.3. If you attempt to install and then use an earlier version after installing At Ease 2.0.3, a window appears telling you to contact the administrator, and then your computer shuts down. In order to use At Ease, you must install the At Ease 2.0.3 program again.

Removing At Ease permanently from your hard disk

To remove At Ease from your hard disk, use the Installer program that came with the At Ease software. Follow the instructions for removing At Ease in the At Ease 2.0 Owner's Guide or the At Ease 2.0 for Workgroups Administrator's Guide.

Do not remove At Ease by dragging the files to the Trash; if you do, you may not be able to restart your Macintosh.

NEW FEATURES

Creating buttons for file servers

The administrator can create At Ease buttons for file servers so that individual users or particular setups can have direct access to file servers. If you have At Ease 2.0.3, a button is created for an individual user. If you have At Ease 2.0.3 for Workgroups, a button is created for a particular setup. The administrator must connect to the file server before he or she can create a button for it in At Ease.

Once the administrator creates the button, a user or a particular setup is able to use that server. In most cases, a user must be registered to use a server and is required to enter his or her name and password after connecting to the file server (by clicking the server button). However, some servers do allow guest access.

To create an At Ease button for a file server you are connected to:

1. Open the At Ease Setup program.
 - If At Ease is already open, choose Go To At Ease Setup from the Special menu.
 - If you are in the Finder, double-click the At Ease Setup program to open it.
2. Type the administrator password and click OK.
3. If you have At Ease 2.0.3 for Workgroups:
 - Select a setup and click Open.
 - Then go to step 5.
4. If you have At Ease 2.0.3:
 - Select a user and click Open.
 - Then click Next.

5. Click the Find Items button.

The Find Items screen appears.

6. Type all or part of the name of the file server in the upper box.

7. Click the Find button.

A list of items appears on the left, showing all items whose names contain the text you typed, including any file servers you are connected to.

8. Click the file server and click the Add button.

The selected file server now appears on the right. To select more than one item in the list, hold down the Shift key while you click the names of the items.

9. When you have finished searching and adding items, click OK.

10. If you have At Ease 2.0.3 for Workgroups, click OK. Then go to step 12.

11. If you have At Ease 2.0.3:

- Click Next.
- Click Next once more, then click Done.

12. Choose Quit from the File menu to leave the At Ease Setup program.

Choosing application preferences

Some application programs need to access special files that come with the application. Sometimes these files may not be available to a user or setup, because of file or folder restrictions placed on a user or setup.

For example, The Writing Center comes with a set of pictures that are in the Pictures Folder. To use these pictures, The Writing Center application program must have access to that folder. A setup or user may not have access to that folder, however, and therefore would not be able to see or use these pictures because of security features within the At Ease program.

The administrator can now allow an application to bypass a setup or a user's folder and open and save these special files anywhere, such as in the application's folder or in the System Folder. In most cases, this enables programs to run more smoothly.

This feature is normally turned on. The administrator may want to turn it off for a particular application if it is not running properly with this feature turned on.

To change the application preferences:

1. Choose Go To At Ease Setup from the Special menu.
2. Type the administrator password and click OK.
3. Choose Application Preferences from the Options menu.
The Set Application Preferences window appears.
4. Click the desired application.

Information appears in the Application Preferences window at the bottom.

5. If you wish, click the checkboxes to change the settings.
For most applications, the default setting is for both checkboxes to be active (marked with an X).

6. Repeat steps 4 and 5 for each desired application. When you are finished setting application preferences, click OK.

7. Choose Quit from the File menu to leave the At Ease Setup program.

Changing the administrator's password

The administrator now must type his or her old password before changing the administrator password. The administrator is the only user who can change this password.

1. Choose Go To At Ease Setup from the Special menu.

2. Choose Administrator Password from the Options menu.
The Administrator Password screen appears.

3. Type your old password in the upper box. Then type your new password in the middle and lower boxes.
You can type up to 15 characters. As you type, dots (•••) appear in place of the text so that anyone nearby will be unable to see what password you have typed. Be sure to choose a password that only you would know.

4. If you wish, click inside the lower box and type a clue that will help you remember your new password.
You can type up to 63 characters. The clue will appear each time you are asked to provide the administrator password. As with the password itself, be sure to choose a clue that only you will recognize.

5. Click OK.
In the future you will need to provide the administrator password before you can use the At Ease Setup program. You can change the password at any time—but only after entering the original password.

6. Choose Quit from the File menu to leave the At Ease Setup program.

Sharing files while using the computer for other work

You can share files on your computer in At Ease while you are doing other work, such as writing a document. If file sharing is turned on, it starts when the computer starts up and stops when the computer is shut down.

Using ClarisWorks

A printing problem in versions 2.0 and 2.0.1 of At Ease has been fixed. You can now print and view entire pages of ClarisWorks™ documents in At Ease 2.0.3 and At Ease 2.0.3 for Workgroups.

USING AT EASE 2.0.3 WITH SYSTEM 7.5

At Ease 2.0.3 and At Ease 2.0.3 for Workgroups are compatible with System 7.5. However, some control panels and other features of System 7.5 may work differently while At Ease is running. This section provides information on these differences. Please refer to the Macintosh Guide, available in the Guide menu (marked with a question mark icon on the right of the menu bar), for more information on these topics.

AppleScript

Scripts written using AppleScript can be launched by At Ease. However, scripts that require the Finder will not run properly.

Extensions Manager

You cannot change the settings in this control panel while At Ease 2.0.3 is running.

Find File

When At Ease 2.0.3 or At Ease 2.0.3 for Workgroups is open, Find File does not allow you to open or print items that are found.

General Controls control panel

Documents

This option can control where the Documents folder is created on your computer. At Ease always tries to open or save a document in the user's folder, within the At Ease Documents folder, regardless of the settings in the Documents option.

If At Ease is running and you have not changed the Documents option, At Ease creates the Documents folder on the startup disk. If At Ease is not running and you select the Documents folder radio button, the Documents folder is created on the desktop.

Launcher

The Launcher does not work with At Ease 2.0.3 and if it is set to open at startup, it will not do so.

Macintosh Easy Open (version 1.1 or later)

If you attempt to open a document without the application program that created it and Macintosh Easy Open is active, a dialog box asks if you want to open the document with another program. The only programs displayed are those made available to the user in the At Ease Setup program.

PowerTalk

You can now receive PowerTalk mail in the background while you are in At Ease. However, to read or write mail, you must be in the Finder.

QuickDraw GX

At Ease now supports printing from QuickDraw GX. However, once you start a print job you cannot log out of At Ease or go to the Finder until the printing is completed. If QuickDraw GX is installed, print jobs that are stopped cannot be restarted within At Ease. The user or the administrator must go to the Finder

to restart a print job.

Printer menu

When the user has access to the Chooser and QuickDraw GX is active, a new menu appears in At Ease called "Printer." This menu contains all desktop printers that have been created, with a checkmark next to the currently selected printer. To select a different printer, simply choose its name.

Printer Status command

To view the status of the currently selected printer, choose Printer Status from the Printer menu. Print jobs started by your computer are displayed. A pop-up menu allows you to view the status of other printers.

Shutdown Items folder

The Shutdown Items folder is located within the System Folder. All items in this folder are started when you choose the Shut Down command from the Special menu to shut down your computer.

USING AT EASE 2.0.3 FOR WORKGROUPS

Security in At Ease for Workgroups

Several new security options are included with At Ease 2.0.3 for Workgroups. These include the ability to prevent users from disconnecting from file servers and the option of remembering the file servers that a user is connected to at login. The Lock Startup Volume option has also changed.

In addition, changes have been made in At Ease 2.0.3 and At Ease 2.0.3 for Workgroups to better ensure that the administrator's password cannot be easily obtained. These new and changed features are described next.

Preventing users from disconnecting from AppleShare volumes

When this option is active (marked with an X), the administrator's password is required to disconnect from file servers. This allows the administrator to decide whether a file server should be disconnected and prevents unauthorized users from disconnecting file servers. This option also ensures that connected file servers are always available.

Remembering user's AppleShare volumes at login

When this option is active (marked with an X), if you connect to a file server while in At Ease, you are reconnected to that file server when you log in to At Ease again.

When this option is not active (the checkbox is blank), file servers that are set in the Chooser to open at start up will now be available to all users. If you connected to a file server while in At Ease, and then quit At Ease, the next time you log in to At Ease, you are not automatically reconnected to the file server you were connected to earlier.

Locking the startup disk

When you choose this option, At Ease locks your startup disk by installing security software on it. This security software cannot be installed on hard disks that have been initialized by driver software that is not compatible with At Ease 2.0.3 for Workgroups.

If At Ease detects an incompatible hard disk, the Lock Startup Volume checkbox is dimmed. Contact the publisher of the driver software to see if a compatible version is available. The At Ease security software cannot be installed on any hard disk partitioned with A/UX.

- Updating disk drivers

If you need to update the driver software for a locked disk, first choose Security from the Options menu in the Setup program and click the Lock Startup Volume checkbox to remove the X.

- Changing the startup disk

If you lock the startup volume, do not change the startup disk selected in the Startup Disk control panel. If you change the startup disk, your At Ease startup volume will not appear on the desktop when you restart the computer, and you will not be able to reselect it from within the Startup Disk control panel.

- Virtual memory

If you have more than one hard disk, the Lock Startup Volume security feature may not protect the startup disk when virtual memory is turned on. Turn off virtual memory on your startup disk if you want to use this security feature.

For more information on security features, see Chapter 5 of the At Ease 2.0 For Workgroups Administrator's Guide.

To change the security options:

1. Choose Go To At Ease Setup for Workgroups from the Special menu.
2. Type the administrator password and click OK.
3. Choose Security from the Options menu.
The Security window appears.
4. Click the checkboxes to change preferences.
5. When you are finished changing the settings, click OK.
6. Choose Quit from the File menu to leave the At Ease Setup for Workgroups program.

If you forget the administrator password

If you forget the At Ease administrator password, follow the instructions below instead of those in the manual.

Note: If your startup disk is locked, you'll first need to run the Unlock program on the At Ease 2.0.3 Utilities disk to unlock the startup disk. Consult the At Ease 2.0 for Workgroups Administrator's Guide for information about the

Unlock program.

1. Start up your computer from another startup disk.
You can use any disk that has system software on it. (See the manual that came with your computer for instructions on choosing a startup disk.) If your computer came with a floppy disk called Disk Tools, you can use this disk.
2. Open the System Folder of your usual startup disk.
3. Open the At Ease Items folder inside your System Folder.
4. Drag the At Ease Preferences file to the Trash.
5. Hold down the Option key while you choose Empty Trash from the Special menu.
6. Restart from your usual startup disk.
7. Open the At Ease Setup for Workgroups application.
If you are using an AppleShare file server as the At Ease disk, your setups may not appear until you reset the At Ease disk to this file server.
8. If necessary, reconnect to the file server and use the At Ease Disk command to reselect the server.
Make sure you use the information on the server instead of replacing it with the information on the startup disk.
9. Choose Administrator Password from the Options menu.
10. In the middle and lower boxes, type a new password. Then click OK.
You can type up to 15 characters. As you type, dots (•••) appear in place of the text so that anyone nearby will be unable to see what password you have typed.
Be sure to choose a password that only you would know.
11. If you wish, click inside the lower box and type a clue that will help you remember your new password.
You can type up to 63 characters. The clue will appear each time you are asked to provide the administrator password. As with the password itself, be sure to choose a clue that only you will recognize.
12. Click OK.
In the future you will need to provide the administrator password before you can use the At Ease Setup program. You can change the password at any time—but only after entering the original password.
13. Choose Security from the Options menu.
14. If you wish, turn on the following options. Then click OK.
 - Allow remote administration
 - Lock startup volume
15. Turn At Ease back on by clicking the On button.

16. Choose Quit from the File menu to leave the At Ease for Workgroups program.

Using At Ease with a file server

If you have an AppleTalk network of At Ease computers, you can set up an At Ease disk on an AppleShare file server. This allows you to make changes in one place for all connected At Ease computers, and allows users to store documents on the file server so they can access them from any computer on the network.

To set up an At Ease disk on a file server, follow these steps:

1. Install At Ease on all the networked computers but not on the file server. Don't install At Ease on the file server itself. You must use the Finder on this Macintosh.
2. Set up the At Ease disk on the server as described in Chapter 4 of the At Ease 2.0 for Workgroups Administrator's Guide.
3. Perform the Update Computers procedure as described in Chapter 6 of the At Ease 2.0 for Workgroups Administrator's Guide.
You need to update computers only once. All future changes made to At Ease will automatically be seen by any At Ease Macintosh configured to use this server. (The update does not take effect on a remote computer until the computer is restarted or returned to the Login screen.)
4. When you use At Ease for Workgroups, keep in mind the following cautions:
 - There can be no more than 1000 total users for all setups.
 - Every At Ease computer is set up using the same AppleShare account. That account must be permitted to read and write to the Documents folder on the At Ease disk.
 - You cannot run the At Ease Setup program from more than one Macintosh concurrently.

TIPS FOR USING AT EASE 2.0.3

- Do not move the Finder from your System Folder. (At Ease may not work properly if the Finder is not present.)
- Application programs that you install are not automatically placed on the At Ease Items panel. Use the At Ease Setup program to give users access to these programs.
- When adding items for a setup, the Add Applications button does not add any Apple II application programs. Use the Find Items button to add these application programs.
- If an At Ease user saves a document in a folder other than his or her own user folder (or floppy disk), the document will not appear on the user's panel.
- When using the Copy To Floppy or Copy From Floppy command, clicking Stop does not interrupt copying of the file in progress, but stops copying after it

has been completed. If additional files were selected, they are not copied.

- Do not run an installer program for another program from within At Ease. To use an installer, first turn At Ease off and return to the Finder.
- Make sure that virtual memory is turned off when you are using the Speak Button Names option.
- Turn on Balloon Help to get more information about items in At Ease or At Ease Setup. (For instructions on turning on Balloon Help, see the At Ease 2.0 Quick Reference Card or the At Ease 2.0 for Workgroups Quick Reference Card.)
- If you are using A/UX, make sure that all At Ease users share the same A/UX login user name.
- If you are running At Ease 2.0.3 for Workgroups and you use Adobe Type Manager (ATM), turn it off on the computers you are updating. Then restart these computers before using the Update Computers feature of the At Ease Setup program. Turn ATM back on after you finish updating the computers, then restart the computers.

IMPORTANT:

When you are finished viewing and/or printing this file, choose Quit from the File menu.

PC Exchange: Will it Recognize Windows 95 File Names? (8/95)

Revised: 8/30/95
Security: Everyone

PC Exchange: Will it Recognize Windows 95 File Names? (8/95)

=====

Article Created: 30 August 1995

TOPIC -----

Will PC Exchange recognize beyond the 8.3 naming convention when extended files names are created on a DOS disk under Windows 95?

DISCUSSION -----

File names longer than 11 characters can be used in Windows 95, but that same file also has the customary 8+3 character name when you exit Windows 95 and return to DOS. PC Exchange supports the DOS naming convention, and therefore does not recognize the extended file names implemented with Windows 95. PC Exchange will display the file's 8+3 character file name that is presented in DOS.

TelePort Gold IIv Modem: Call Arbitration (9/95)

Revised: 9/7/95
Security: Everyone

TelePort Gold IIv Modem: Call Arbitration (9/95)

=====
Article Created: 30 August 1995
Article Reviewed/Updated: 7 September 1995

TOPIC -----

Is the Global Village TelePort Gold IIv internal modem, bundled with the Performa 5200 and 6200 family of computers capable of determining whether an incoming call is a fax or voice call?

DISCUSSION -----

The internal modem bundled with these computers automatically handles arbitration between the GlobalFax and MegaPhone software. To setup the software, so the modem will arbitrate your calls, open the Telephone Setup control panel and select the "Auto-answer incoming calls after 4 rings" option. This selection will direct the incoming call to the appropriate software, whether the call is either voice, or fax.

Use the search string 'megaphone and record' to locate the TIL article "MegaPhone: How to Record Outgoing Message" for additional information on setting up your computer as an answering machine.

QuickTime for Windows 2.0.3: Key Features (8/95)

Article Created: 30 August 1995

TOPIC -----

This article provides a list of key features found in QuickTime for Windows 2.0.3.

DISCUSSION -----

KEY FEATURES IN QUICKTIME FOR WINDOWS 2.0.3

- New single file QuickTime installer for more reliable installs.
- Support for text tracks.
- Support for MPEG tracks with Sigma Designs Reel Magic Board.
- Support for MPEG file playback via Sigma Designs Reel Magic Board.
- Support for MPEG decompressor Components.
- Support for MIDI Music tracks.
- Support for IMA4 compressed audio.
- Support for Video Hardware frame buffer access Components.
- Player application can copy selected portions of text track and current visuals to clipboard.
- Support for P9000 Graphics accelerator.
- Support for the Cirrus Logic CL-GD54xx GUI accelerator.
- Support for the WD 90C33 Graphics accelerator.
- OLE 1.0 (Object Linking & Embedding). The Movie Player is an OLE server, enabling QuickTime movies to be placed and played in Microsoft Excel 4.0, Word for Windows 2.0, Write, and Word Perfect 5.2 using QuickTime's human interface
- MCI (Media Control Interface) provides media integration in applications like Windows Media Player, AimTech Icon Author, and Asymetrix Multimedia Toolbook.
- Visual Basic 2.0 is supported with a .VBX file for integration of QuickTime Movies into multimedia applications created with Visual Basic 2.0.
- QuickTime for Windows 2.0.3 supports custom add-in decompressors, such

as Intel's Indeo.

- Support for more audio and video card configurations. See PC VIDEO CARD COMPATIBILITY and PC AUDIO CARD COMPATIBILITY for a listing of the audio and video cards which have been tested with QuickTime for Window 2.0.3.

QuickTime For Windows 2.0.3: ReadMe (4/97)

Article Created: 30 August 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article contain the QuickTime for Windows 2.0.3 Read Me file.

DISCUSSION -----

QuickTime for Windows
version 2.0.3
Release Notes 13 June 1995

QuickTime for Windows 2.0.3 must be licensed for distribution. If you have received QuickTime for Windows as part of an Apple or third-party product, you are licensed to install and use QuickTime for Windows on your computer. You MAY NOT redistribute QuickTime for Windows in any form without a distribution license from Apple Computer. See TO LICENSE FOR DISTRIBUTION in this document for more information.

IMPORTANT INFORMATION
=====

To play on Windows, a QuickTime Movie created on a Macintosh must be saved as Self-contained and Playable on non-Apple platforms. See MAKING MOVIES PLAYABLE ON BOTH MACINTOSH AND WINDOWS for more information.

Sound and video card compatibility is listed under PC VIDEO CARD COMPATIBILITY and PC AUDIO CARD COMPATIBILITY

Not all OLE client applications are supported by QuickTime for Windows 2.0.3

See OLE 1.0 SUPPORT for more information.

Intel Indeo decompressor is bundled. Support for the Indeo codec is provided by Intel Customer Support at 1-800-468-3548. See INTEL INDEO DECOMPRESSOR IS BUNDLED for more information.

WHAT'S IN THIS DOCUMENT

=====

- New features in 2.0.3
- Making movies playable on both Macintosh and Windows
- Product submissions encouraged
- OLE 1.0 support
- Intel Indeo decompressor is bundled
- Macintosh features that are not currently supported
- Minimum PC configuration
- Components of QuickTime for Windows 2.0.3
- To license for distribution
- Where to get QuickTime for Windows today
- Recommended for development
- PC Audio card compatibility
- PC Video card compatibility
- Modifying QTW.INI for compatibility

KEY FEATURES IN QUICKTIME FOR WINDOWS 2.0.3

=====

- New single file QuickTime installer for more reliable installs.
- Support for text tracks.
- Support for MPEG tracks with Sigma Designs Reel Magic Board.
- Support for MPEG file playback via Sigma Designs Reel Magic Board.
- Support for MPEG decompressor Components.
- Support for MIDI Music tracks.
- Support for IMA4 compressed audio.
- Support for Video Hardware frame buffer access Components.
- Player application can copy selected portions of text track and current visuals to clipboard.
- Support for P9000 Graphics accelerator.
- Support for the Cirrus Logic CL-GD54xx GUI accelerator.
- Support for the WD 90C33 Graphics accelerator.
- OLE 1.0 (Object Linking & Embedding). The Movie Player is an OLE server, enabling QuickTime movies to be placed and played in Microsoft Excel 4.0, Word for Windows 2.0, Write, and Word Perfect 5.2 using QuickTime's human interface
- MCI (Media Control Interface) provides media integration in applications like Windows Media Player, AimTech Icon Author, and Asymetrix Multimedia Toolbook.
- Visual Basic 2.0 is supported with a .VBX file for integration of QuickTime Movies into multimedia applications created with Visual Basic 2.0.
- QuickTime for Windows 2.0.3 supports custom add-in decompressors, such as Intel's Indeo.
- Support for more audio and video card configurations. See PC VIDEO CARD COMPATIBILITY and PC AUDIO CARD COMPATIBILITY for a listing of the audio and video cards which have been tested with QuickTime for Window 2.0.3.

MAKING MOVIES PLAYABLE ON BOTH MACINTOSH AND WINDOWS

=====

To make a movie playable on a PC, on a Macintosh open a movie file using the Movie Converter utility (part of the QuickTime Starter Kit 1.0) and choose Save As (File menu). In the resulting dialog box, click the radio button labeled Make movie self-contained which tells the utility to sever any links to other movies after incorporating the relevant video into this movie. Also select the checkbox labeled Playable on non-Apple computers. This causes the movie to be saved as a single forked movie. The resulting movie is cross-platform and is still in the QuickTime file format.

Once you save the movie, it will be playable on both Macs and PCs without further translation or file conversion. Before you transfer the movie to a PC, remember to give it a filename thats no longer than 8 characters, plus the extension .MOV for example, MYMOVIE.MOV.

PRODUCT SUBMISSIONS ENCOURAGED

=====

Apple Computer encourages developers of current and intended commercial products which use QuickTime for Windows to send us evaluation copies. For example, products such as CD-ROM titles, Movie clip libraries, applications and utilities are often considered for future co-marketing opportunities. Two copies are requested, one for marketing evaluation and one for technical evaluation. These products will be used to ensure full compatability with future versions of QuickTime for Windows. Please submit with appropriate product and company information to:

QuickTime for Windows Product Submission
Apple Computer, Inc.
1 Infinite Loop, MS: 302-3KS
Cupertino, CA 95014

OLE 1.0 SUPPORT

=====

The QuickTime for Windows 2.0.3 Movie Player is an OLE 1.0 Server. Due to a lack of standards in OLE 1.0 implementation, it is difficult to guarantee support of QuickTime for Windows with all OLE -supporting Client applications. The following products have been tested and compatibility verified. Support for other OLE Client applications cannot be guaranteed.

- Microsoft Windows 3.1 Write
- WordPerfect 5.2
- Microsoft Word for Windows 2.0
- Microsoft Excel 4.0
- Microsoft Multimedia Works for Windows

INTEL INDEO DECOMPRESSOR IS BUNDLED

=====

Intel's first release of its Indeo decompressor is bundled with this product. Please contact Intel for support and for future updated releases of Indeo. Intel Customer Support is at 1-800-468-3548.

MACINTOSH FEATURES THAT ARE NOT CURRENTLY SUPPORTED

=====

Capture
Compression
PhotoCD
SMPTE Time codes
Data references

NOTE:

When producing QuickTime Movies, you are encouraged to use advanced features on the Macintosh release of QuickTime. It is likely that features currently unique to the Macintosh will be supported in subsequent releases of QuickTime for Windows.

MINIMUM PC CONFIGURATION

=====

- 386SX at 20 Mhz
- 4 MB RAM
- 80 MB hard disk
- VGA or better display card
- QuickTime provides best quality and performance on cards displaying 32,768 color or more. See the end of this document for a list of tested compatible audio and video cards.
- A Sound card for playback of Movies with sound
- Windows 3.1 or later
- DOS 5.0. MS-DOS 6.0 and 6.2 with and without double space is supported.

COMPONENTS OF QUICKTIME FOR WINDOWS 2.0.3

=====

- DLLs
- Movie Player application and OLE 1.0 server
- Picture Viewer application
- On-line help

TO LICENSE QUICKTIME FOR WINDOWS FOR DISTRIBUTION

=====

Contact:

Apple Software Licensing
20525 Mariani
MS: 38-I
Cupertino, CA 95014
408-974-4667
fax: 408-862-5106
eMail: SW.LICENSE

Please provide the following information to receive a license agreement:

- Contact person
- Mailing address
- Phone number
- Fax
- Provide a proposal that includes a complete description of the product, how QuickTime for Windows is used in the product, and the distribution plans for the product.

You will receive a QuickTime for Windows License Kit containing the Apple License Agreement and license information.

WHERE TO GET QUICKTIME FOR WINDOWS TODAY

=====

QuickTime for Windows is bundled with various 3rd party products that support QuickTime for Windows such as Movie clip libraries, software applications and CD-ROM titles. Look for the QuickTime for Windows logo on the packaging of products such as these:

- Adobe Premiere 4.0 for Windows
- Macromedia Action 2.5 for Windows
- Macromedia Authorware Pro 2.0 for Windows
- The QuickTime for Windows Development Kit (APDA, #R0453LL/B), provides you with an ISO format CD-ROM that contains the DLLs, sample applications and source code, movie files, on-line documentation, help files and the QuickTime for Windows programmers manual. Six (6) DOS-based disks containing a subset of CD-ROM contents are also available for those without a CD-ROM drive.
- Look for other QuickTime for Windows retail products in 1995.

RECOMMENDED FOR DEVELOPMENT

=====

In addition to the QuickTime for Windows Development Kit, the following is useful in the development of cross-platform QuickTime support.

- QuickTime for Macintosh Development Kit (APDA)
- QuickTime Movie Exchange Toolkit (APDA #R0190LL/A)
- Convert multimedia data created on other workstation platforms to QuickTime Movies playable on a Macintosh.

QuickTime for Windows 2.0.3 Hardware Compatibility List

=====

This document is meant to be an aid to developers who are working with and distributing QuickTime for Windows per their license agreement. The list is by no means comprehensive but has grown substantially over the past year. The Video and Audio Hardware adapters are divided into three basic classifications Supported, Compatible and In-Compatible.

- Supported hardware/driver combinations are those that have been tested as part of the QTW development plan and are considered benchmarks to the product.
- Compatible hardware/drivers are those combinations that have been tested but not as thoroughly as Supported items but appear to function adequately.
- In-Compatible hardware/driver combinations are those recognized as having significant problems in appearance or behavior with QTW.

Another category that we've added to our report is Optimized.

Optimized video hardware/driver combination allows QTW to write directly to the video memory speeding up video performance significantly.

Whenever possible the name of the manufacture, product name, driver date or version when known, and depth in the case of video drivers is listed.

Supported Video

=====

Begin_Table

Adapter	Driver	Depth	Resolution	Optimized?
-----	-----	-----	-----	-----
Standard VGA	Windows VGA	4	640x350	No
Standard EGA	Windows EGA	4	640x480	No
IBM 8514	Windows	8	1024x768	No
IBM XGA	07/27/92	4	640x480	No

Turtle Beach MultiSound	MULTISND.DRV	08/27/92	1.1
ATI Stereo F/X	SFX.DRV	05/04/92	

End_Table

Notes:

(1) - This driver has a know bug that effects all Windows applications that use sound where at times a portion of the sound will be repeated several times.

(2) - This driver some times 'sticks' on a sound.

(3) - Make the following modifications to the QTW.INI file.

[Sound]

RequestedRate=22095

ActualRate=22536

(4) - Does not support sound sampled at above 11khz. Make the following modifications to the QTW.INI file.

[Sound]

RequestedRate=11025

ActualRate=11025

End_Table

Notes:

- (1) - In the 24 bit mode (16 Million Colors) Reds and Blues seem to be reversed .
- (2) - Field reports of systems hanging when movies are played with is board.
- (3) - We have field reports that QTW does not work with is card.
- (4) - Movies render as a thin line at the top of the screen in 24-bit mode. All other functions are normal.
- (5) - We have a field report that QTW does not work with the orginal MediaVision video display adapter. The report indicates that the movies sound is played but the movie can not be seen. Problem persists when Optimize is set to driver
- (6) - We have field reports of sound but no movie (video) with this card.
- (7) - We have several field reports dealing with a Packard Bell. Reports of a "shutters" type effect on local bus systems have been noted. The shutters effect is where a few lines of movie can be seen, then a few lines of background, then a few lines of movie, and so on. The reports also state that the image is also shifted down and to the right about 10 pels. Further reports tell of a lack of Movie image when running on Local Bus Packard Bell Machines.
- (8) - QTW has very poor performance with is adapter.
- (9) - We have field reports that the Optimize = Driver must added to the QTW.INI before the movie will appear in the movie window frame. Audio and all other actions seems to be OK with out the change

In-Compatible Audio

=====

Media Vision Thunder and Lighting: QTW has very poor throughput with this card.

Media Vision CDPC: QTW does not work well with is system with movies over 10 seconds in length.

Media Vision CDPC II: QTW does not work well with is system with movies over 10 seconds in length.

Sigma Design WinStorm 8/21/92: Very poor QTW performance when running audio and video together.

Tandy 'Gold Card': Only one unconfirmed report on this line of cards. A developer states that he has a Tandy "Gold Card" and QTW crashed whenever he trys to play a movie. Removing the card seems to fix the problem.

MODIFYING QTW.INI FOR COMPATIBILITY

=====

NOTE: Modification of the QTW.INI file should be done at your own risk. Typically one does not need to make any modifications to this file. For some compatibility issues, modifying the file will make video or audio cards work properly, but with reduced performance. Be sure to make a backup of the QTW.INI file before modifying it.

The most common modification to the QTW.INI is to change the [Video] setting to Optimize = Driver. This may resolve severe compatibility problems with a specific video card but will also reduce the performance of Movie playback. Once again, modify at your own risk.

[Video] (in order of priority)
Optimize = Hardware (default)
Driver
BMP
RAW
DIB

[Video Optimize]
This is not used

[Override] // group
DREF = no or yes {NO forces QTW to use the file as self referencing,
useful for QT 1.0 files}

[Data Handler]
CDROM Xfer Rate* = [integer] ranges from 100 to 600, where number is in K, default is 328.
CDROM Seek TTime* [integer from 0 to X] where x is 100 to 350 in ms for average seek, default is 200.
CDROM Block Size = [integer, expressed in K] default is 8, range is 1 to 64.
Max Open Files =[integer] default is 64.
Max Consumers = [integer] usually same as Max Open Files. You can have multiple consumers per file.
Max Cache Size = [integer] expressed in K, default is 128, ranges from

64 to 512.

Disk Xfer Rate = [integer] same as CDROM Xfer Rate, default is 300.

Disk Seek TIme [integer] expressed in millisecon s per average seek,
default is 35.

Disk Block Size = [integer, expressed in K] default is 16, range is 1 to
64.

Network Xfer Rate = [integer] same as CDROM Xfer Rate, defalut is 250

Network Seek TIme [integer] expressed in millisecon s per average seek,
default is 40.

Network Block Size = [integer, expressed in K] default is 16, range is 1 to 64.

Floppy Xfer Rate = [integer] same as CDROM Xfer Rate, default is 18.

Floppy Seek TIme [integer] expressed in millisecon s per average seek,
default is 100.

Floppy Block Size = [integer, expressed in K] default is 2, range is 1
to 64.

[Sound]

Requested Rate = [integer] ranging from 5000 to 44000 (has to be exact
rate for MPC cards)

Actual Rate = same possible rates as requested

* Note: Set dynamically by QuickTime for Windows, based on what it
senses as the CD-ROM speed.

PowerBook 5300: PC Card Modem Connection Files ReadMe File 5/97

Article Created: 30 August 1995
Article Reviewed/Created: 1 May 1997

TOPIC -----

This article contains the Read Me file included with the PC Card Modem Connection Files on the PowerBook 5300 computers.

DISCUSSION -----

About PC Card Modem Files

The PC Card Modem Files folder contains modem connection files for various PC Card modems that will work with several application programs. If your modem file is not included, please contact your communications software manufacturer to see if your modem is supported.

Using eWorld with a PC Card modem

Follow these steps as a guideline for setting up communications programs to use the Communications Toolbox.

Note: The files listed below were designed to work with the United States phone system. These files may or may not work properly outside of the United States.

To select the correct modem file for your PC Card modem, follow these steps:

Step 1

Insert your PC Card modem.

Step 2

Click the Edit Local Setup button.

Step 3

Select the port that your PC Card modem is in. You should see either upper or lower PC Card slot listed. If you don't, make sure your modem is properly inserted. The upper and lower PC Card slots will appear in the dialog box only when a PC Card modem is inserted.

Step 4

Choose your modem from the Modem Type pop-up menu. If your PC Card modem is not listed, try Generic PC Card Modem or Hayes Basic. If that doesn't work, you may need to create a new modem type.

Using Apple Remote Access with a PC Card modem

=====

Apple Remote Access (ARA) uses modem files (sometimes called connection scripts or CCLs) to get the best performance from some modems. Follow these steps to select your modem file:

Step 1

Insert your PC Card modem.

Step 2

Open the ARA application program.

Step 3

Open Remote Access Setup.

Step 4

Choose your modem from the Modem pop-up menu. If your PC Card modem is not listed, check in the ARA Connection Files folder. If the file for your modem appears, drag it to the Extensions folder (inside the System Folder). If the file for your modem is not listed, try using an existing modem file from the pop-up menu (such as a different model from the same manufacturer). If this doesn't help, you may need to get a connection script from your PC Card manufacturer.

Step 5

Choose the port that your PC Card modem is in. You should see either upper or lower PC Card slot listed. If you don't, make sure your modem is properly inserted. If you insert the PC Card modem in the other slot, you need to reselect the modem port before you can use ARA.

Using AppleLink with a PC Card modem

=====

To use AppleLink with a PC Card modem, follow these steps after you have installed the AppleLink software:

Step 1

Insert your PC Card modem.

Step 2

Open the AppleLink Connection Files folder (inside the PC Card Modem Files folder in the Apple Extras folder on your hard disk).

Step 3

Drag the icon for the PC Card Modem (USA) file to the Connection Files folder (inside the AppleLink folder). If a dialog box appears advising you that older files with the same name already exist, click OK.

Step 4

Open the AppleLink application program.

Step 5

Choose Set Up Connection from the Network menu.

Step 6

Choose CommToolbox from the Connection Port pop-up menu.

Step 7

Choose Serial Tool from the Method pop-up menu.

Step 8

Select the Upper Slot or Lower Slot icon in the Current Port window. The modem must be inserted to display its icon in the window. You must always insert the modem in the same slot, or you'll need to set up the modem again for the other slot.

Step 9

Choose PC Card Modem (USA) from the Connection File pop-up menu.

PowerBook 190 & 5300: Service & Support ReadMe File (4/97)

Revised: 4/29/97
Security: Everyone

PowerBook 190 & 5300: Service & Support ReadMe File (4/97)

Article Created: 30 August 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article contains the Service and Support Read Me file that shipped on the PowerBook 190 and 5300 series computers.

DISCUSSION -----

Thank you for purchasing a Macintosh PowerBook computer. You have joined the ranks of millions of people around the world who enjoy using a Macintosh computer.

We at Apple Computer take great pride in building the easiest-to-use computer in the industry. However, if you have questions about your computer, or you need service, there are many helpful resources available to you. A booklet called the "Apple Resource Guide" came in the box with your computer. It describes in detail your computer's warranty as well as resources for service and support.

If you have questions as you work with your computer, you will find answers in the manuals or in the Apple Guide online help that came with your computer.

Other Resources Include
=====

Apple User Groups

Joining a user group lets you learn about using your computer from people who use their Apple computers in all kinds of interesting ways. To contact a user group in your area, call 800-538-9696, ext. 500.

Apple-Authorized Training Providers

These providers offer training courses (from basic to advanced levels) designed to help people get the most from their computers. For more information, call

800-732-3131, ext. 400.

Apple's Worldwide Disability Solutions Staff

This group is committed to making computer resources available to people with special needs. Call 408-974-7910 or 408-974-7911 (TDD).

Service and Support

If you think your computer might require service or have problems with system software, please consult the troubleshooting section of the manual that came with your computer or call 800-SOS-APPL (800-767-2775).

Third-party Software Support Phone Numbers

=====

This is a listing of customer support phone numbers for the companies which produce the software included with your Macintosh. If you experience problems with the software, please contact the software developer directly, rather than Apple Computer. This will greatly speed resolution to your question.

Begin_Table

Software Application	Publisher	Customer Assistance Number
-----	-----	-----
MacLink Plus/Easy Open Translators	DataViz	(203) 268-0030
Super Maze Wars or Spin Doctors	Callisto	(508) 655-0707
Eric's Ultimate Solitaire Sampler	Delta Tao	(408) 730-9336
Adobe Acrobat	Adobe	(206) 628-2757

Disk Image Mounter: ReadMe File (8/95)

Revised: 8/30/95
Security: Everyone

Disk Image Mounter: ReadMe File (8/95)

=====

Article Created: 30 August 1995

TOPIC -----

This article contains the Read Me file included with the Disk Image Mounter Utility that shipped with the new PowerBook 5300 and 2300 computers.

This utility makes it possible to mount the disk images included with these PowerBooks and complete a floppyless installation of software.

DISCUSSION -----

Using Disk Image Mounter

What is a disk image?

A disk image is a discrete electronic representation of an individual disk. The Disk Images folder in the Floppy Disk Maker folder on your hard disk contains the disk images you need to create installer disks for both your system software and the other software that comes on the hard disk.

Using disk images to install software

When you use Floppy Disk Maker, it copies the disk images onto floppy disks. You use these disks to reinstall the software that comes on your computer. If you don't have the floppy disks you made with Floppy Disk Maker and you still have the disk images that came on your hard disk, you can use Disk Image Mounter. Disk Image Mounter is an application program that mounts disk images on your desktop. Once mounted, you can install software from the disk images.

To install software from disk images, follow these steps:

1. Double-click the Installer file for the application program you want to install.

2. Follow the instructions on the screen.

As long as you did not delete the disk images from your PowerBook's hard disk, Disk Image Mounter will mount the necessary disk images on the desktop and install the software from the images. If you quit in the middle of the installation process, the disk images may still be mounted on the desktop. To unmount a disk image, drag it to the Trash.

Workgroup Server 9150/120: Logic Board Upgrades (5/96)

Revised: 5/17/96
Security: Everyone

Workgroup Server 9150/120: Logic Board Upgrades (5/96)

Article Created: 30 August 1995
Article Reviewed/Updated: 17 May 1996

TOPIC -----

Which Macintosh computers can be upgraded to the Workgroup Server 9150/120? What is the supported method for performing this upgrade?

DISCUSSION -----

The following computers can be upgraded to a Workgroup Server 9150/120:

Quadra 900
Quadra 950
Workgroup Server 9150/80

Customers wishing to upgrade a Quadra 900, 950, or Workgroup Server 9150/80 to a Workgroup Server 9150/120 must order the Workgroup Server 9150/120 Logic Board Upgrade (M4047LL/A). This upgrade includes all necessary parts and software. The Workgroup Server 9150/120 Logic Board Upgrade also includes:

- 8MB DRAM (additional DRAM may be required)
- 1 MB level-2 cache
- System Software 7.5.1
- Apple RAID Software
- AppleShare 4.1 update kit

NOTE:
This product requires installation by an Apple-authorized service provider.

UNSUPPORTED UPGRADES
=====

Some customers have obtained Workgroup Server 9150/120 logic boards (service part: 661-0210) in order to upgrade their systems. This is NOT a supported solution, and permanent hardware damage is likely. The 9150/120 Logic Board

..TIL18513-Workgroup_Server_9150-120-Logic_Board_Upgrades_5-96.pdf

Upgrade (M4047LL/A) and logic board (p/n 661-0210) are not equivalent either in terms of the software, or hardware. Systems upgraded using the service part are not covered under warranty in the event of logic board failure, and customers are not entitled to software updates.

Multiple Scan Displays: Why use them? (10/95)

Revised: 10/10/95
Security: Everyone

Multiple Scan Displays: Why use them? (10/95)

Article Created: 31 August 1995
Article Reviewed/Updated: 10 October 1995

TOPIC -----

What is the purpose of the Multiple Scan Displays, such as the Multiple Scan 15 Display, Multiple Scan 17 Display, and Multiple Scan 20 Display?

DISCUSSION -----

Multiple scan monitors, such as the Apple Multiple Scan 15, 17, and 20 Displays, have the advantage of using different lines of resolution. The Apple Multiple Scan 15 Display has the option of displaying an image at 640x480 or 832x624 lines of resolution. This means you can switch the number of lines being drawn. The first number refers to the number of vertical lines going down the screen from left to right, while the second refers to horizontal lines going across the screen from top to bottom. Having more lines gives you a larger display area in the same space. While the images may look smaller on your monitor at the higher resolution, you can actually see more of an image. For example, at 640x480 you may be able to see about half the page of a word processing document, but if you switch to 832x624 resolution, you can see more of the document, closer to two-thirds of the page. Larger monitors such as the Apple Multiple Scan 17 or 20 Displays will give you even more resolutions to choose from. Switching resolutions gives you the choice of how much of an image you want to display on the same size monitor.

LaserWriter 3.0 for Windows: Drivers supported (8/95)

=====

Article Created: 31 August 1995

TOPIC -----

What printers are installed with the LaserWriter Printer software 3.0 for Windows?

DISCUSSION -----

The LaserWriter Printer Software 3.0 for Windows installation disks ship with the Color LaserWriter 12/600 PS. You can also download the LaserWriter Printer Software from online services. The three disk set includes the latest Adobe PostScript driver and some Apple PPDs. The following printers are part of the installation:

Adobe Default Printer
Apple Color LaserWriter 12/600
Apple LaserWriter 16/600 PS
Apple LaserWriter Pro 600
Apple LaserWriter Pro 630
Apple LaserWriter Select 360

PlainTalk Microphone: Don't Use To Connect Other Devices (8/95)

Revised: 8/31/95
Security: Everyone

PlainTalk Microphone: Don't Use To Connect Other Devices (8/95)

=====

Article Created: 31 August 1995

TOPIC -----

I'm having trouble finding an adapter to connect my line-level home stereo equipment to my Power Macintosh 6100. Can I cut the microphone off my PlainTalk microphone and use the cable to connect my line-level equipment?

DISCUSSION -----

Using the cable from a PlainTalk microphone to connect another recording device is unsupported, voids your warranty, and can cause irreparable damage to the logic board on some Macintosh computers.

The microphone port on all Macintosh Computers that use the PlainTalk microphone is a standard stereo 3.5mm stereo plug. The PlainTalk microphone has an extra 1/4 inch on the tip to get +5 volt power from the logic board. It is also a mono plug, so the rubber rings on it do not match a stereo plug. The microphone plug has 2 separators. The one near the end is used to isolate the power at the tip. This can be confusing to those who think that our port is longer and has non-standard spacing for the left and right channels.

To connect an RCA equipped line-level device such as a VCR or home audio equipment to your Macintosh, a standard RCA to 3.5mm stereo adapter cable can be used. An example of this is a 6 foot stereo mini to RCA cable available from most electronic suppliers.

PhotoFlash 2.0: Type 11 Errors on PCI-based Power Macs (9/96)

Revised: 9/19/96
Security: Everyone

PhotoFlash 2.0: Type 11 Errors on PCI-based Power Macs (9/96)

=====

Article Created: 31 August 1995
Article Reviewed/Updated: 19 September 1996

TOPIC -----

Whenever I click on the Enhance menu in PhotoFlash 2.0 on my Power Macintosh 9500, I get a Type 11 error. What is wrong?

DISCUSSION -----

This error may occur on any PCI-based Power Macintosh including the Power Macintosh 5400/7200/7500/7600/8500/9500, and Performa 6400 computers.

This problem is resolved in the PhotoFlash 2.0.1 update, which is available from online services.

NOTE:

The QuickTake 150 software v.2.0.1 installs PhotoFlash 2.0. The version of PhotoFlash must be 2.0.1 to work properly with PCI-based Power Macintosh computers. Use the Get Info from the file menu to determine the version of PhotoFlash you have installed.

What is Included in the Update

The update is a self-extracting archive containing an installer application. When you double-click the installer icon, a dialog prompts you to find the PhotoFlash application. You need to highlight the PhotoFlash application, then click continue.

These articles can help you locate the PhotoFlash software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

Macintosh 5200 Series: VRAM not expandable (8/95)

Revised: 8/31/95
Security: Everyone

Macintosh 5200 Series: VRAM not expandable (8/95)

=====

Article Created: 31 August 1995

TOPIC -----

Can I expand the VRAM on my Macintosh Performa 5200?

DISCUSSION -----

The Performa 5200 series and the Power Macintosh 5200/75 do not implement VRAM. These systems store video data in a 1 megabyte (MB) DRAM frame buffer (separate from RAM) and no further video memory expansion is supported.

If you need a display with more VRAM, you can install a third-party video card in the processor-direct slot (PDS).

The following computers are in the Macintosh Performa 5200 series: Performa 5200 and Performa 5215.

Apple Video, Video/TV, and Presentation Systems (2/97)

Revised: 2/17/97
Security: Everyone

Apple Video, Video/TV, and Presentation Systems (2/97)

Article Created: 31 August 1995
Article Reviewed/Updated: 17 February 1997

TOPIC -----

This article describes the Apple Video System, the Apple Video/TV System, Apple TV/FM Radio System, and the Apple Presentation System.

DISCUSSION -----

The following table lists the Macintosh Computers that can take advantage of the Apple Video System, the Apple Video/TV System, Apple TV/FM Radio System, and the Apple Presentation System:

Begin_Table

Computer	Systems
-----	-----
Power Macintosh 5200/75 LC	All
Macintosh Performa 580	All except Video/TV
Macintosh Performa 630 series	All
Macintosh Performa 640CD DOS Compatible	All
Macintosh Performa 5200 series*	All
Macintosh Performa 6200 series	All
Macintosh Quadra 630	All except TV/FM
Macintosh LC 630	All except TV/FM
Macintosh LC 580	All except Video/TV and TV/FM

End_Table

* Note:

The Macintosh Performa 5200 series requires the Apple External Video Connector (M4099LL/A) in order to use the Apple Video System, the Apple Video/TV System, and the Apple Presentation System.

Apple Video System (M2894LL/D**)

This multimedia solution comes with a user-installable video card and software that lets you easily add still video images to the documents and presentations you create on your Macintosh computer. The video card allows you to connect a VCR, camcorder, laserdisc player, or other video source to your computer with a single cable.

Compatible Computers:

Quadra 630

LC 580, 630

Power Macintosh 5200, 5300, 6200, 5400, and 6300 series

Performa 580, 630 series, 640 CD DOS Compatible, 5200 series, 6200 series, 6300CD, 6320CD.

** Apple has revised its video-in card (and the part number) to make the card more compatible with Power Macintosh computers. Earlier video-in card kits (with part numbers ending in /A, /B, or /C) are not recommended for use with Power Macintosh and/or Macintosh Performa 5200 series computers.

Apple Video/TV System (M2896LL/C)

The Apple Video/TV System gives your computer the capabilities of the Apple Video System, and more--it also allows you to watch television programs in a window on your Macintosh, and work on documents simultaneously. The Apple TV/Video System comes with a video card, TV Tuner card, remote control, and software.

Compatible Computers:

Quadra 630

LC 630

Power Macintosh 5200/75LC, 5260/100, 5260/120

Performa 630 series, 640 CD DOS Compatible, 5200 series*, 6200 series, 6300CD, 6320CD.

Apple Presentation System (M2895LL/A)

The Apple Presentation System makes it easy for you to create a presentation on your Macintosh, then display it to an audience on a larger television screen exactly as it appears on your Macintosh display. You can also connect your Macintosh to a VCR and record your presentation on videotape for easy and inexpensive distribution. The Apple Presentation System comes with software, cables, and video converter box. Unlike the Apple Video and Apple Video/TV systems, the Apple Presentation System can be used with any Macintosh that has a VGA or Apple 13/14-inch RGB output. This list includes, but is not limited to, any PowerBook with VGA or Apple 13/14-inch RGB output, Macintosh LC, Performa 400-600 models, Centris, Quadra, or other Macintosh systems with VGA video out.

Apple TV/FM Radio System (M4586LL/A)

The Apple TV/FM Radio System consists of a plug-in card with TV and FM radio tuners, plus easy-to-use control software. Connectors on the back of the tuner card let you attach cable TV or antenna feedlines. An FM antenna is included. The Apple TV/FM Radio System works with the Apple Video System*** to help you perform powerful multimedia tasks easily. Just click to capture and save still frames, video clips, or audio. Then simply paste the saved items into presentations, reports, and letters to make them really come alive. Audio and video can be played back with any application that supports Apple's QuickTime multimedia technology.

*** The Apple TV/FM Radio System requires a Macintosh Performa or Power Macintosh computer with a video-in card. While some Macintosh Performa and Power Macintosh computers come with a video-in card pre-installed -- like, for example, the Power Macintosh 5400/120 -- most will require the purchase of the Apple Video System (M2894LL/D).

Compatible Computers:

Performa 5400/160, 6360/160, 6400/180, 6400/200
Power Macintosh 5260/120, 5400/120, 5400/180

Article Change History:

17 Feb 1997 - Added new part numbers.
10 Jan 1997 - Added TV/FM information.
04 Jan 1996 - Removed keyword.

Performa 640 DOS Compatible: Adding Memory (8/95)

Revised: 8/31/95
Security: Everyone

Performa 640 DOS Compatible: Adding Memory (8/95)

=====

Article Created: 31 August 1995

TOPIC -----

I would like to upgrade the memory in my Performa 640 DOS Compatible computer, for the computer itself and the DOS card. How do I do this?

DISCUSSION -----

Different RAM Expansion Slots

The Performa 640 DOS Compatible computer ships with 8 MB of on-board memory and is expandable to 52 MB (for 68040 mode). This is achieved by installing one 32 MB SIMM in the double-sided slot and 16 MB in the single-sided slot. (The dimensions for each slot are printed on the logic board.)

It is possible to have other configurations greater than 8 MB and less than 52 MB. One must remember however, that the single-sided slot must always be half the value of the double-sided slot. For instance, a 16 MB SIMM can be inserted in the double-sided slot and an 8 MB SIMM in the single-sided slot.

DOS Card Memory

The plug-in DOS card ships with 4 MB of RAM and is expandable to 32 MB. The DOS Card contains 1 SIMM slot. The upgrade is achieved by removing the 4 MB SIMM and installing (at the largest) a 32 MB SIMM.

Performa 6214CD: Specifications (4/97)

Article Created: 31 August 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article gives the technical specifications for the Macintosh Performa 6214 CD computer (B2414LL/A). This computer is based on the previously-released Macintosh Performa 6216, but it comes without a modem and with no telephony or fax software.

This computer is only being made available to campus resellers in Higher Education markets. It is not available to any other customers via any other channel.

DISCUSSION -----

Microprocessor

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus

Memory

- 8 MB RAM
 - Expandable up to 64 MB (32 MB x 2 slots)
 - Two 72-pin SIMM slots, 80 ns or faster
 - Expandable one SIMM at a time
 - 32-bit memory bus
- 4 MB ROM on 64-bit PPC bus

Storage

- 1.4 MB Apple SuperDrive disk drive - read and write MS-DOS disks
- 1 GB IDE hard drive, 1/3 height
- AppleCD 600i CD-ROM drive (Quad Speed)

Expansion & Ports

- LC processor direct slot
- Video-in slot for optional video capture card
- TV tuner slot
- Communications slot
- SCSI interface for connecting up to five external devices
- One serial (RS-232/RS-422) printer port
- ADB port
- Sound-in (PlainTalk compatible)
- Sound-out

Video

- 1 MB DRAM video frame buffer
- 16-bit color at 640x480, 8-bit color at 800x600, 832x624
- Supports Video In with optional card

Sound

- 16-bit CD audio
- 16-bit sound out and internal*
- PlainTalk (or line level) microphone required

Ergonomic Features

- Front controls for volume and contrast
- Front headphone jack
- Infrared remote control
- Power on/off from keyboard

Keyboard

- Includes AppleDesign Keyboard
- Supports all Apple Desktop Bus (ADB) keyboards

Mouse

- Apple Desktop Mouse 11

Clock/Calendar

- CMOS customer chip and battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Electrical Requirements

- 110 - 240v, 50 - 60 Hz
- Power consumption 45 watts max (excluding monitor)

- EPA Energy Star compliant

ADB Power Requirements

- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA
- Keyboard draws 10mA

Size and Weight

- Height: 4.3 in. (10.95 cm)
- Width: 12.6 in. (32 cm)
- Depth: 16.5 in. (41.95 cm)
- Weight: 19 lb. (8.6 kg)

Operating Environment

- 10°C to 40° C (50°F to 104°F)

System Software

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

Power Macintosh: Memory Sizing Algorithm (8/95)

Revised: 8/31/95
Security: Everyone

Power Macintosh: Memory Sizing Algorithm (8/95)

Article Created: 31 August 1995

TOPIC -----

I have a brand Power Macintosh 8100/80 computer. I used to have to have a Macintosh Quadra 840AV computer. I have put the RAM from my Quadra into my new Power Macintosh computer. I have 40 MB of RAM (two 16 MB SIMMs and two 4 meg SIMMs), but the computer is stating that he has 72 megs of RAM. Also it sometimes crashes with an Error Type 11. I do not have RAM Doubler software installed. What is going wrong?

DISCUSSION -----

You need to check the installation of your RAM. If you do not install the RAM in the correct pairs, the system will think you have more RAM than you actually do. In this case, you have two 16 MB SIMMs and two 4 meg SIMMs, which would normally give you 48 megs of RAM. However, if you insert these as 16, 4, and 16, 4, the system will think it has 32 + 32 + 8, or 72 MB of RAM total. Improper installation of the RAM can cause various system errors such as you are experiencing.

The Power Macintosh memory sizing algorithm looks at the highest capacity memory the SIMM bank can handle. It then assumes that both SIMMs are the same size. If one is not correctly (equally) sized, then the computer will present you with a system error as soon as your system and application memory usage goes beyond the 8 MB memory that is on the logic board.

DOS Compatibility Card: Windows 95 is Compatible (9/95)

Revised: 9/23/96
Security: Everyone

DOS Compatibility Card: Windows 95 is Compatible (9/95)

Article Created: 1 September 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

Does DOS Compatability Card support Windows 95?

DISCUSSION -----

Apple's Software Quality Assurance team has determined that, based on test results from running Microsoft's official Windows 95 System Compatibility Tests, the following cross-platform Macintosh systems are compatible with Windows 95 when configured with a minimum of 8MB of RAM for the Windows 95 environment:

- Power Macintosh 6100/66 DOS Compatible
- Macintosh LC 630 DOS Compatible
- Macintosh Performa 640CD DOS Compatible
- DOS Compatibility Card for Power Macintosh 6100 and Performa 6100 Series

In addition, customers have had the ability to create separate drive containers on Apple's cross-platform Macintosh systems from the beginning. This feature provides additional value today for those customers who want the option of retaining their current Windows 3.1 environment in one drive container, while installing Windows 95 in another one, allowing them to easily select either drive container as the boot drive using the PC Setup control panel--all on a single personal computer.

By providing compatibility with software developed for the Mac OS, MS-DOS 6.22, Windows 3.1, or Windows 95, Apple's cross-platform Macintosh systems "stand out by fitting in"--enabling customers to run more applications on a Macintosh than on any other mainstream personal computer.

DOS Compatibility Card Questions and Answers

=====

Question: Are Apple's cross-platform Macintosh systems compatible with Windows 95?

Answer: Yes, based on test results from running Microsoft's official Windows 95 System Compatibility Tests, Apple's Software Quality Assurance team has determined that Apple's cross-platform Macintosh systems are compatible with Windows 95.

Question: Are Apple's cross-platform Macintosh systems compatible with the "Plug-and- Play" specification?

Answer: Like any legacy PC system that shipped prior to the availability of a Plug-and-Play BIOS, the above systems do not pass those specific Windows 95 System Compatibility Tests that require conformance to the "Plug-and-Play" specification. However, unlike other legacy PCs, Macintosh personal computers have delivered full plug and play capabilities for years. In addition, Apple's cross-platform Macintosh systems come preconfigured with features that often require users to plug in a separate card, frequently with configuration problems, on a PC, such as Sound Blaster 16-bit sound capabilities.

Question: Are Apple's cross-platform Macintosh systems compatible with Windows for WorkGroups 3.11?

Answer: Yes, Apple's cross-platform Macintosh systems are compatible with Windows for WorkGroups 3.11. Apple continues to support network client software via the Open Data-Link Interface, or ODI (used in Novell Netware 3.x/4.x, TCP/IP client software). While native NDIS support is not supported today, Apple expects to provide this capability in the future. Many customers are successfully using ODI-to-NDIS shims today, even though, as with any software translation layer, performance is not optimized.

Question: Can I use shared memory (allocating a portion of Macintosh motherboard memory in the PC Setup control panel) when running Windows 95?

Answer: Yes, and given the system requirements of Windows 95, Apple recommends a minimum of 8 MB of RAM. Of course, installing at least 8 MB of RAM directly on the DOS Compatibility Card will provide even better performance when running MS-DOS and Windows applications.

Question: How should I configure Windows 95 for printing on Apple's cross-platform Macintosh systems?

Answer: Since Apple's current cross-platform Macintosh systems do not have a physical PC parallel port, and therefore do not support bi-directional parallel port functionality, Apple recommends that users configure Windows 95 for printing as follows:

Step 1

Open My Computer, open Printers, and add a printer.

Step 2

Open the printer that has been added by double clicking on the icon from the Printers folder.

Step 3

From the Printer menu, choose the item called Properties.

Step 4

In the Properties window, select Details, and then select Spool Settings.

Step 5

In Spool Settings, disable the bi-directional port.

Question: What about networking support on Apple's cross-platform Macintosh systems?

Answer: Apple continues to support network client software via the Open Data-Link Interface, or ODI (Novell Netware 3.x/4.x, TCP/IP client software). While native NDIS support is not supported today, Apple expects to provide this capability in the future. Many customers are successfully using ODI-to-NDIS shims today, even though, as with any software translation layer, performance is not optimized.

Question: Since Windows 95 makes more use of 2-button mouse functionality, is that supported on Apple's cross-platform Macintosh systems?

Answer: Yes, Apple's cross-platform Macintosh systems let users mimic the functionality of the right mouse button by hitting the "=" key on the numeric keypad. For those users who want to use a real ADB multi-button mouse with Windows 95, several products are available from third-party companies such as Logitech (Logitech MouseMan ADB) and Kensington (Kensington Turbo Mouse 4.0 or Kensington Thinking Mouse ADB).

Question: When I installed Windows 95, the copy-and-paste functionality between the Mac OS and Windows environments stopped working. Is there a workaround?

Answer: Windows 95 made changes that negated the ability to copy-and-paste data between applications running in the Mac OS and Windows 95 environments. While Apple expects to provide the capability to copy-and-paste between the Mac OS and Windows 95 environments in the future, there are a couple of workarounds today. First, Macintosh PC Exchange and Macintosh Easy Open continue to make it easy for customers to identify, and automatically launch, Mac OS applications to open documents saved in the most popular PC formats. Second, users can create separate drive containers--one with the Windows 3.1 environment and one with the

Windows 95 environment--and work within the Windows 3.1 environment when they need to copy-and-paste data between the Mac OS and Windows environments.

Question: My Windows 3.1 configuration files (AUTOEXEC.BAT and CONFIG.SYS) assume Microsoft's CD-ROM driver, MSCDEX, is in the C:\DOS directory. Where is MSCDEX located when I install Windows 95?

Answer: In Windows 95, MSCDEX is located in the Windows:Commands directory.

RAM Disk: With Virtual Memory or RAM Doubling Software (9/95)

Revised: 9/1/95
Security: Everyone

RAM Disk: With Virtual Memory or RAM Doubling Software (9/95)

=====

Article Created: 01 September 1995

TOPIC -----

I have 8mb of physical RAM installed and would like to have a 12mb RAM disk. Is it possible to use virtual memory or RAM doubler to "increase" my available RAM to 24mb and then use a 12mb RAM disk?

DISCUSSION -----

Virtual memory as well as RAM "doubled" programs like RAM Doubler can not be allocated for use as a RAM disk. The RAM disk option only addresses built-in physical RAM and will simply ignore any RAM that is virtual memory or created by software.

Newton Connection: Multiple Sync Folders (9/95)

Revised: 9/1/95
Security: Everyone

Newton Connection: Multiple Sync Folders (9/95)

Article Created: 01 September 1995

TOPIC -----

I synchronize my MessagePad 120 every couple of days, with my computer using the Newton Connection Kit 2.0. I noticed that in the Newton Connection folder, I have three folders "My Name's Newton", "My Name 1's Newton" and "My Name 2's Newton". I can tell by the last modification date that the "My Name 2's Newton" folder contains the most current files, but why do I have three folders?

DISCUSSION -----

You are correct in assuming that "My Name 2's Newton" contains the most current synchronization files. Another way to find the most current set of sync files is to check the creation date on the folder. The most recently created folder has the most recent creation date. The folder should also have the highest "user name x's" number.

The MessagePad has a unique identification code that is not apparent to the user. This identification code is used by the Newton Connection Kit to ensure synchronization occurs between the MessagePad and the appropriate files which have matching identification numbers.

If the MessagePad is erased, a new identification number is created on the MessagePad. The next time the Newton Connection Kit synchronizes, the identification code on the MessagePad does not match the identification code on the previous synchronization files, so a new set of files, with the same name and a numerical suffix added, are created.

Before throwing away the older synchronization files, you may want to copy the information out of the old Archive files, and paste it into the new Archive file. This is not necessary if you do not want to keep track of the data that has been removed from the MessagePad.

Once you have removed the previous synchronization files, you can delete the number 2 from the name of the current synchronization files to avoid any

confusion.

LaserWriter Select 300: LEDs Don't Indicate Out of Paper (9/95)

Revised: 9/1/95
Security: Everyone

LaserWriter Select 300: LEDs Don't Indicate Out of Paper (9/95)

=====

Article Created: 01 September 1995

TOPIC -----

On a LaserWriter Select 300, the LEDs do not light when the paper is out or when there is a paper jam. It will return the error through the driver to the computer when an error is detected. The error light can be manually tripped so the hardware is working correctly. Is this a function of the driver?

DISCUSSION -----

This is correct. The LED functions of the LaserWriter Select 300 are controlled by the software driver. Under normal operating conditions, the LED will not report an error of this sort. The error will only be reported via the software driver. It sounds as if the customers printer is functioning normally.

Replacement of parts would be futile in attempts to resolve this as it is considered normal operation.

Newton Connection: Sync Files with Same Dates (9/95)

Revised: 1/4/96
Security: Everyone

Newton Connection: Sync Files with Same Dates (9/95)

=====

Article Created: 01 September 1995

TOPIC -----

I have three folders "My Name's Newton", "My Name 1's Newton" and "My Name 2's Newton" in my Newton Connection folder. I understand how these folders get created when the unique identification code on the MessagePad gets changed. What I have noticed is that some of the files even within the older synchroniation folders have had there modification dates changed to concide to the most recent synchronization.

Evidently, the Newton Connection Kit is not just searching for the highest numbered folder. Are these older files actually being changed? I thought they were safe. Does the Newton Connection search the whole hard drive? Why does this happen anyway?

DISCUSSION -----

The Newton Connection will only search through folders that recide within its folder. It looks for folders whose name contains the user name in the MessagePad. It will not search the whole hard drive or ask the user to locate the sync file. If the folder is moved or renamed, NCK will create a new one.

When the Newton Connection finds a folder whose name contains the user name, it opens the "user name's Newton" file. This is done to compare the ID number stored in the file to ID number in the MessagePad. This changes the modification date of the file. If the numbers are the same, NCK uses this file.

Newton Connection continues the above process until it has found the correct synchronization file or runs out of folders. If it can not find the correct sync file, it creates a new folder and sync files.

The only files where the modification dates are the same are the Newton files. The archive, backup and card files are not touched so their modification dates are different and can be used to find the latest sync files.

Another way to find the most current sync files is to check the creation date on the folder. The most recently created folder has the most recent creation date. The folder should also have the highest "user name x's" number.

Apple II: Transferring Files To a Macintosh (9/95)

=====

Article Created: 6 September 1995

TOPIC -----

This article provides instruction on converting Apple II files to MacWrite files using Bank Street Writer.

DISCUSSION -----

To convert Apple II Bank Street Writer word processor files into Macintosh MacWrite files follow these steps.

Step 1

Use the System Utility option within Bank Street writer to convert the binary Bank Street Writer documents to ProDOS 3.3 ASCII text files. This must be done for each file that you intend to transfer to the Macintosh.

NOTE:

Make sure that the names of the files contain only the letters (A-Z), no numbers or other marks.

Step 2

Use the ProDOS System Utilities Diskette to copy the DOS 3.3 ASCII text files that you have created to a ProDOS formatted disk. (You will need your original DOS 3.3 disk, and a new disk that has been formatted with ProDOS.)

Step 3

Use an Apple II computer that is equipped with both a 5 1/4" disk drive and a 3 1/2" disk drive. Again, use the ProDOS System Utilities disk to copy the files from the 5 1/4" disk to a ProDOS formatted 3 1/2" disk.

Step 4

Use a Macintosh computer equipped with a FDHD (high density) disk drive (Macintosh SE/30 or later) and PC Exchange 1.1 or later.

Step 5

Insert the disk into your Macintosh and use MacWrite or your favorite word processor to open each file. Once you have verified that everything is intact, choose "Save as..." from the file menu and save the file.

Pippin: Questions and Answers (Part 1 of 2) (1/96)

Article Created: 01 September 1995
Article Reviewed/Updated: 09 January 1996

TOPIC -----

This article is part one of answers to questions concerning the Apple Pippin.

DISCUSSION -----

Question: What is Pippin?

Answer: Pippin is a multimedia player platform derived from Apple's second generation Power Macintosh hardware and system software. It is designed as a playback tool for multimedia CD-ROMs initially created for the Macintosh and/or IBM compatible PC and at a low cost.

Pippin is directed to the home market (and probably schools) as an integral part of the consumer AV stereo and TV environment. Its primary display will be a TV screen. It uses one of the most advanced RISC microprocessor architectures in the industry today, PowerPC. It is derived from both the hardware and software architectures of the Macintosh. It will provide developers with an easy way to take their investment in personal computer CD-ROM content and make it available to a wider audience in a more natural environment associated with entertainment and fun.

Question: What events led to the introduction of Pippin?

Answer: The percentage of personal computers having CD-ROM drives, is rapidly approaching 100% for the Macintosh. In 1994, for the first time, the worldwide sales of personal computers (from all manufacturers) into the home exceeded 10M. It was also the first year in which more personal computers sold into the home went those already having a personal computer.

More than 60% of the households in the U.S. have combined gross income less than \$40,000 per year. While most of these homes have one or more television sets, it

is expected that even by 1997 the number of homes in this category with a personal computer will be well below 10%. The high barrier price of personal computers is limiting its penetration into homes around the world. Multimedia hardware and content sales will be limited in the years to come, just as many new title publishers are entering the industry. It is essential to the long-term health of the CD-ROM title industry that the growth it is experiencing now, continue into the future.

Apple realized that for multimedia technology to reach the home, the entry price must be reduced substantially. A low entry price is still not enough. The platform must be distributed by many companies which collectively can reach a much larger audience than one company alone. Apple has chosen to make the Pippin platform available under license to manufacturers interested in building and selling their own version.

Question: How will Pippin be positioned in the market?

Answer: If all a family wants is the least expensive video game player and does not want to be able to use their purchase for other uses they will probably be better off buying the upcoming new platforms being introduced by the video game giants Nintendo and Sega. Other new platforms such as Atari Jaguar, Sony Playstation and 3DO are all video game players and cannot be useful for much else. It remains to be seen how these platforms will hold up against the two mainstay players, Nintendo and Sega.

Apple believes that families are looking for more than video game players today. Certainly they want to be able to play their favorite games, but they also want to communicate, learn, play interactive music, access information and much more. Pippin provides them this capability. In addition it provides them a high level of compatibility with a mainstream personal computer technology. This will provide them the knowledge that their investment in CD-ROM titles and experience will not go to waste.

Question: What is the difference between a Macintosh and Pippin?

Answer: Pippin is derived from the second generation of Power Macintosh computers. Much of its system software code, integrated circuit cells and integrated circuits come directly from the Macintosh world. Pippin is being designed for optimal playback. It operates from a run-time version of the MacOS on less memory with more dedicated functions. While it is possible to add mass storage devices in the aftermarket, Pippin will ship with only a readable CD-ROM mechanism as a mass storage device.

Question: If there is no hard disk, how is the system software distributed?

Answer: The system software will be incorporated into the hardware separate from the CD-ROM player. Different Pippin system software releases will be available from which the developer to choose. Each will support a different functionality set. The end customer will not know or care which version of the operating system is bundled with their CD-ROM title. The Pippin title will support successive generations of titles always improving in performance and

functionality.

Question: Why is Apple doing this?

Answer: This is a logical extension of our existing technology. It capitalizes on Apple's expertise in multimedia, RISC and ease-of-use....using resources and technology that are already in place today, not an entirely new product or market concept. The architecture and business model for Pippin are designed to provide this wealth of content with a means for reaching an audience substantially larger than that which exists today. For Apple this is a strategic thrust to expand its business beyond the sales of personal computers and at the same time put the multimedia industry, currently in its infancy, into high gear. This is part of Apple's on-going strategy to expand the reach of Macintosh technology into new markets.

Question: Why now?

Answer: There were two key elements missing that prevented Apple from launching Pippin earlier. The first is technology. QuickTime has progressed as an industry standard and has developed increasingly in sophistication to the point now that it is an extremely compelling technology. In addition, Apple had to make the transition to RISC microprocessor technology. To reach the performance necessary for game and multimedia playback RISC technology is a must. Apple has successfully made the transition to RISC.

The second major reason why Apple has waited until now is market maturity. The year 1994 will be known within the industry as the year in which Multimedia became mainstream. CD-ROM titles are being reviewed in the New York Times Book Review section. Hit titles such as Myst, Rebel Assault, Star Trek Interactive Manual, Doom, etc. are hitting distribution volumes ranging between 200,000 and 1,000,000 units. The momentum for creating the content is now in place. Pippin is designed to take this momentum of content on the personal computer and distribute in much greater volumes throughout the world.

Question: How did Apple choose the name Pippin?

Answer: Pippin is a type of apple. It is smaller than a mcintosh apple. Apple chose this name because it would be easily associated with Apple, Computer Inc. Moreover, Apple believes that over time Pippin will take many forms including home telecommunication devices, game players and much more. Hence, Apple did not want to choose a name that would be specific for a certain market space as it will certainly appeal to many types of consumers and be shipped in a variety of forms from many manufacturers.

Question: What type of CD-ROM titles will work on Pippin?

Answer: Apple is integrating hardware technologies which improve the "on-screen" appearance of text on a TV screen. While the text will never be as clear as that on a computer monitor it is substantially better than anything in the video game

industry today. This was done because Apple intends to encourage a wide diversity of titles to be available on Pippin, including reference titles which contain a great deal of textual information. We expect action games, adventure games, simulation, role-playing games, puzzles, reference, education, learning, interactive music and more.

Pippin is not expected to be strong in document creation or modification. Computer applications are not well suited to systems without a lot of memory. Simple word processors, simple spread sheets, tax preparation programs, financial management tools, and children's authoring tools should work well on a Pippin as long as there is a rewritable mass storage device that can store data files.

Customers

Question: What is in this for the customer?

Answer: For the first time, the customer will be able to "buy-in" to the era of multimedia and cyberspace at a low entry ticket price. The customer will be able to expand the entry system through aftermarket add-ons, accessing some personal computing capabilities if they choose. They will be able to buy the unit from a variety of companies in different configurations in a multitude of distribution channels. Their Pippins will integrate within their audio-visual consumer electronics world. In addition, it will be able to communicate and transfer files with their personal computers should they have them in their home. Finally, the Pippins with the addition of a GeoPort adapter or external modem will permit the customers to communicate over cyberspace.

Question: Will Pippin reduce the system configuration problems faced in the personal computer market?

Answer: Pippin is designed to behave like an audio CD Player. The customer inserts the CD-ROM into the player and it automatically boots off the CD. There are no files to configure and no drivers to conflict over system resources.

Question: Can customers upgrade their Pippins?

Answer: Pippin is the most expandable device in its category. The consumer can add system memory easily using plastic DRAM memory cards. In addition, through the PCI-like expansion, manufacturers will be able to add other devices, including mass storage devices, graphics accelerators, compression decoders and more. Thus, by purchasing easy to add/configure add-ons, the customers will be able to retain their investment into the future.

Question: Will customers upgrade Pippin to a Macintosh?

Answer: Pippin cannot be made into a Macintosh. Without the availability of a high speed read/write mass storage device customers will find it difficult (at

best) to utilize current "standard" personal computer applications. It would not be unfair to say, however, that Apple would like Pippin customers to also be Macintosh customers. The advantage for the customer is that their investment in titles can be played on both machines.

Question: Wouldn't customers rather view their titles on a computer screen?

Answer: This actually depends upon the customer and the title. The vast majority of the worldwide market doesn't own a computer monitor and is unlikely to own one any time soon. This permits a larger number of people to interact with the screen simultaneously. This also enables customers to integrate their Pippin with their home entertainment environment.

If customers prefer, they will be able to attach a 640x480 VGA monitor to Pippin.

For additional information on the Pippin, see "Pippin: Questions and Answers (Part 2 of 2)" and "Pippin: Technical Specifications."

Pippin: Questions and Answers (Part 2 of 2) (9/95)

Article Created: 01 September 1995

TOPIC -----

This article is part two of answers to questions concerning the Apple Pippin.

DISCUSSION -----

Pippin Manufacturers

Question: Will Apple ship a Pippin under its own brand?

Answer: Apple does not plan on shipping a Pippin under its own brand. One of Apple's primary goals is to see Pippin devices penetrate into as many homes worldwide as possible. For this to happen Apple will focus its energies on assisting other companies in reaching these channels as they differ from Apple Computer's existing computer reseller channels.

Question: Will Apple be the only hardware/software supplier for the platform?

Answer: No! Pippin is an open platform. Apple intends to encourage other companies to create not only differentiated Pippin systems, but also third-party aftermarket add-ons. Other companies can be expected to build upon Apple's reference design and add their own value through either cost reductions or feature innovation.

Question: How many companies will be shipping Pippins?

Answer: The only publicly announced company at the time this document is being distributed is Bandai Company Ltd., a major toy manufacturer and CD-ROM game title publisher in Japan. Since Apple announced the platform in Tokyo on December 13, 1994, there have been many inquiries from companies interested in taking a license around the world. As contracts are signed and companies choose

to announce their intents, the developer community will be among the first to know.

Over time, nothing will limit the number of companies that will be shipping Pippin devices. Apple believes that there is sufficient demand in the US, Japan, Asia and Europe.

Technical Issues

=====

Question: Will Pippin titles play on a Macintosh?

Answer: Yes, Pippin titles will play on Macintosh computers. If the titles are 68k based they will play on both Power Macintosh and 68k based Macintosh computers. If the titles are written in native PowerPC code they might also play on both platforms depending upon whether or not the developer chose to code in fat binaries or not.

Question: Will Macintosh Titles play on a Pippin?

Answer: Yes, if the title is restamped with the Pippin system software. For some titles other modifications may be required, see below.

Question: Will DOS/Windows Titles play on a Pippin?

Answer: Yes, but with much more modification and recompilation as compared to Macintosh titles.

Question: Can Pippin be turned into a Macintosh?

Answer: No. While customers will be able to expand it through the addition of mass storage devices, codecs, video inputs, etc. it will remain a run time environment fundamentally more limited than a Macintosh.

Question: Can a keyboard, monitor or mouse be added?

Answer: Yes, and so easily a child could do it!

Question: What exactly will be included with a Pippin?

Answer: This will be specific to each manufacturer. The features that, at a minimum, will be common to each version of Pippin is listed separately.

Question: What kind of input device will be standard?

Answer: Input devices will vary between Pippin Manufacturer. Apple has been

conducting global focus group studies on this issue. Obviously developers need to know which buttons, knobs, etc. will be consistent between machines. Apple will be specifying this to both the manufacturers and developers by May at the latest.

Question: What add-on accessories will be available for Pippin at introduction? At a later date?

Answer: At introduction, there will be an external floppy, keyboard, mouse, external ink jet printer and a GeoPort telecom adapter for analog phone lines. The base Pippin units will ship with an accessory kit that will include a single input controller device. Other add-on devices including hard disks, PCMCIA slots, MPEG2 codecs, etc. will be available later in time. Apple will not make commitments as to when they would be available as many of these will be supplied by third parties.

For additional information on the Pippin, see "Pippin: Questions and Answers (Part 1 of 2)" and "Pippin: Technical Specifications."

Pippin: Technical Specifications (9/95)

Article Created: 01 September 1995

TOPIC -----

This article defines the technical specifications for the Apple Pippin.

DISCUSSION -----

Technical Details

Hardware

66MHz PowerPC 603 RISC Microprocessor

- Superscaler, 3 instructions per clock cycle,
- 8 kByte data and 8 kByte instruction caches
- IEEE standard Single & Double Precision Floating Point Unit

6 MB combined System & Video Memory, advanced architecture

4X CD-ROM drive

Aftermarket easy memory expansion cards

- 2, 4 and 8 MB increments

64 kbyte SRAM Store/Restore Backup

Video

- 8 bit and 16 bit video support
- Dual Frame Buffers for superior frame to frame animation
- Support for NTSC & PAL composite, S-Video and VGA (640x480) monitors
- Up to 16.7M colors

Audio

- Stereo 16 bit 44 kHz sampled output

- Stereo 16 bit 44 kHz sampled input

Telephony

- GeoPort ready

Controllers

- Supports up to 4 simultaneous players over Apple Desktop Bus, ADB
- Will support standard ADB keyboards and mice with connector adapters

Data I/O

- 1 standard Serial Communications port

Aftermarket Expansion

• "PCI like" expansion for adding floppy drive, hard disk drive, graphics accelerators, codecs, etc. (Not available at introduction!)

Software

Run time environment derived from MacOS

- Integrates QuickTime 2.0 and PPC native version of QuickDraw
- Reduced system memory footprint - (computer specific features removed)

Disk resident system stamped on CD with title

- System boots off CD
- Pippin system software upgrades released through CD-ROM stamping operations
- Developers free to choose from menu of system software upgrades

ROMs

- 68k emulator
- Macintosh Tool Box intact
- Localized bit mapped fonts
- Reduced Macintosh System ROM footprint

CD Formats Supported

- Standard audio CD
- other formats in market studies

For additional information on the Pippin, see "Pippin: Questions and Answers (Part 1 of 2)" and "Pippin: Questions and Answers (Part 2 of 2)."

PCI-Based Power Macintosh: Get Ethernet Address (10/96)

Revised: 11/7/96
Security: Everyone

PCI-Based Power Macintosh: Get Ethernet Address (10/96)

Article Created: 1 September 1995
Article Reviewed/Updated: 7 November 1996

TOPIC -----

I have a Power Macintosh 9500 and I am unable to use GetMyAddress to determine the Ethernet address of the built-in Ethernet on my Power Macintosh 9500. How can I get the address?

DISCUSSION -----

Current versions of GetMyAddress and other network utilities may not work with System 7.5.2 that came on some PCI-based Power Macintosh computers like the 7200, 7500, 8500, and 9500. You have a number of options.

If you have a Power Macintosh 9500 computer with version 1.0 of the System Enabler 701, you should update to System 7.5.3 or later with Open Transport 1.1 or later. You can then find the hardware Ethernet address by opening the AppleTalk control panel and clicking the Info button in either the Advanced, or Administrator mode.

You can also use one of the following to find the Ethernet address:

Apple LAN Utility 1.0b4e1

Obtain a copy of the Apple LAN Utility, version 1.0b4e1. This utility can locate the physical Ethernet address on a Power Macintosh 7200, 7500, 8500, and 9500 computers. Look for this updated utility on Apple's online software update locations.

IMPORTANT: The Apple LAN Utility, version 1.0b4e1 is not an officially supported solution, but has worked for other users in the past. Please refer to the Apple LAN Utility 1.0b4e1 ReadMe file by searching for the Technical Information Library article titled, "Apple LAN Utility 1.0b4e1: Read Me File."

The Apple LAN Utility is provided to perform the following tasks:

- Obtain the burned-in address without connecting to a network.
- Override the burned-in address with a locally-administered address (this may be required for SNA, DECNet, and other environments).
- Set the speed for Token Ring interfaces that are software selectable.

The utility is intended to handle all Apple Ethernet and Token Ring interfaces, whether built-in or on cards. When run, the utility opens one window per network interface present in the computer, describing what its configuration will be the next time that interface is activated. This utility makes no attempt to alter the current operation of an active interface.

Standard UNIX Tools

Many system administrators may require Ethernet hardware addresses for bootpd and rarpd configurations. If you are using a UNIX host for these network configuration services, you can use standard UNIX tools to determine the hardware address. Follow these steps:

- 1) Configure TCP/IP to the desired IP address
- 2) Ping the Power Macintosh with Open Transport from a UNIX workstation.
- 3) Use arp to display address resolution table. For example, in A/UX the command would be "arp -a".

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the Apple LAN Utility 1.0b4e1 software update mentioned here:

"Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

"Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

- 07 Nov 1996 - Added mode information on the AppleTalk control panel.
- 23 Aug 1996 - Added AppleTalk control panel solution.
- 27 May 1996 - Updated for technical accuracy.

Copyright 1995-96, Apple Computer, Inc.

Color LW 12/600 PS: Competitive Questions and Answers (9/95)

Revised: 1/21/97
Security: Everyone

Color LW 12/600 PS: Competitive Questions and Answers (9/95)

=====

Article Created: 01 September 1995

TOPIC -----

This article provides the answers to questions about the LaserWriter 12/600 PS.

DISCUSSION -----

Question: Why is Apple later to market a color laser printer than its competitors?

Answer: Apple believes that it is much more important to get the printer out right rather than to be simply first. The Color LaserWriter leapfrogs the competition in a number of important and highly valued areas. Our experience with PowerBooks has shown us that completely addressing customer needs is much more important than getting a compromised product out somewhat sooner.

Question: Why is color laser better than other technologies?

Answer: Color laser has four major advantages over competing technologies:

- Print quality. Only color laser can provide near photographic quality color and superior 600 dpi black text on standard office paper. Dye sublimation can print high quality images but its text is low-resolution and prints only on special media.
- Speed. Color laser provides not only fast color pages but fast monochrome pages as well. For this reason only color laser can be used as a shared black and color printer.
- Cost/page. Color laser is more economical for black and color printing than thermal transfer and dye sublimation printers.
- Plain paper. Color laser supports excellent quality and print permanence on standard office paper. Unlike inkjet and thermal transfer, laser can print well

on a variety of papers without smearing or flaking.

Question:

What does Apple think about first generation color laser printers on the market?

Answer: The first generation products force too many compromises on the users.

- The existing color lasers either try to promote inkjet level quality as "business quality" or decent quality only at a very high price. The 300 dpi quality that some are offering just doesn't meet the needs of professionals preparing information for external use. Most businesses don't want to look like they print their documents on a \$500 inkjet printer.
- These printers also have a large number of complex and messy consumables that require much more interaction and sophistication to operate successfully. Customers don't want to worry about 13 replaceable items that can get their clothes messy when they are changed.
- The first generation printers are generally stripped down to the point of being unusable in their base configuration. When purchased, the users have to also buy network cards, PostScript, RAM, and optional paper trays to get a usable shared system. All of these options increase the real cost of the printer and make it more difficult to buy and setup. The bottom line is that we believe the existing color lasers printers don't adequately meet the needs of most of the customers in the market.

Question: Why would anyone pay 10x the price of a color inkjet for Color Laser?

Answer: The primary reasons are productivity, quality, share-ability, and reliability.

- Quality. Apple's Color LaserWriter will offer significantly better print quality than inkjets and it will do so on standard office paper. This quality is acceptable for both internal and external documents.
- Productivity. Color lasers are much faster than inkjet printers. Instead of printing at a few minutes per page they print at a few pages per minute. This added performance means that people can print presentations and reports at the last minute rather than overnight.
- Share-ability. Apple's Color LaserWriter is fast enough and comes standard with PostScript and built-in networking which enables it to be shared in a cross platform workgroup. Low-cost inkjets are typically designed for a single user.
- Reliability. Apple's Color LaserWriter is designed to print 300K pages. This means that a group of users can use it as their only printer.

Question: Who do you think will buy and use color laser printers?

Answer: Initially, we believe there are three primary users for the Color LaserWriter.

- Design/publishing. Design/publishing professionals who want quick, convenient, and inexpensive comps for letter size documents.
- Business communications. There are a large number of people involved in selling and communicating within an organization. This can be in the form of a presentation, report, proposal, etc. The Color LaserWriter offers no compromise quality for black and color.
- Scientific/technical. There are a variety of technical markets that use color but don't have a fast and simple way of printing. The Color LaserWriter provides the quality necessary for applications that vary from satellite imagery to plastic mold flow analysis.

Question: Why are color lasers so much more expensive than monochrome lasers?

Answer: The reason is that they are much more complex than monochrome laser printers. There are significant challenges associated with accurately and consistently putting up to four layers of toner on a piece of paper. The Color LaserWriter is revolutionary because it offers much of the printing functionality of a \$50K 350lb color copier yet reduces both the complexity and the cost.

Question: What does Contone mean?

Answer: Contone stands for continuous tone and means that the printer is capable of printing 256 shades at each pixel for each color toner. Some competitors claim contone printing capabilities but do not meet this criteria because they offer only a couple of shades for each pixel.

Question: What does "true 600 dpi mean"?

Answer: True 600 dpi means that the entire printer is designed for 600 dpi printing. There are four key elements that need to be optimized for 600 dpi.

- Horizontal and vertical addressable resolution. This means that the laser scanner can put a dot down in the horizontal direction at 600 dpi intervals and the engine moves the paper through at 600 dpi intervals. Some printers are not designed for 600 dpi so they must slow down to print at the higher resolution .
- Laser spot size. This refers to the size of the dot that the laser makes on the drum. Some printers actually use a 300 dpi laser spot size to reduce cost but this reduces the quality because large dots are placed very close together with lots of overlap.
- Toner particle size. Smaller toner particles mean that the dots can be more consistent with the smaller spot sizes that provides more gray levels and more detail.

- Controller memory. To offer true resolution, the controller must have sufficient memory to contain the image in the printer.

Question: Why is laser superior to other color technologies?

Answer: There are essentially five high-end color technologies today:

- liquid inkjet
- solid inkjet
- thermal wax
- dye sublimation
- laser

Apple believes that laser and liquid inkjet are the best technologies for mainstream color. Liquid inkjet offers good quality, performance, and simple user interaction at a low cost. Laser offers excellent performance/quality, at a higher price. The other technologies have one or two strong points but are not mainstream and will be relegated to niches.

Question: Will color cannibalize monochrome printers?

Answer: Because research has consistently shown that color output is highly desired in a printer, we do expect that color laser printers will at some point impact high-end monochrome sales. Just as with inkjet, it may take some time for color laser to make a large impact on monochrome sales. This impact will be felt more as the prices of color comes down over time.

Question: Why is Apple's cost/page more expensive than Hewlett Packard (HP)?

Answer: Apple's cost/page is more expensive than HP but less expensive than other competitors. There are two reasons why cost/page is more expensive on the Color LaserWriter.

- Print quality required by professionals and it is more expensive to provide this level of quality.
- Simple setup and use. The enclosed cartridge mono-component system makes it simple to operate compared to HP but does add cost. The cartridge system on monochrome laser printers are not the most cost effective, but they became the standard because they were much easier to use and were clean compared to the alternatives. Apple believes that the cost/page is appropriate when compared to the difficulty of installing and maintaining the 13 consumables in the HP printer.

Question: Why doesn't the printer support PCL?

Answer: PostScript Level 2 is the standard for color printing because the applications and drivers are already available and the results are superior.

PostScript is also the cross-platform standard with drivers available for PC, Unix and Macintosh platforms.

Question: Why doesn't the printer support Token Ring?

Answer: Ethernet is the most important network topology in the Macintosh, PC and workstation world. Token Ring is a lower priority. The printer can be connected to a Token Ring network via Ethernet to Token Ring router.

Question: Why does the printer slow down when printing transparencies?

Answer: The printer prints at up to 1.1 pages/minute when feeding transparencies to ensure that the toner is fused so transparencies project well on an overhead projector. The slower speed allows the toner to be melted into a transparent layer on the film.

Question: What is Apple's Contone Compression Technology, and why is it better than the competition?

Answer: Apple Contone Compression Technology dramatically reduce the RAM requirements for the printer while maintaining superior quality. Because of Apple Contone Compression Technology, the Color LaserWriter can ship with only 12 MB of RAM while supporting full quality, networking, and memory to process complex jobs. Without such compression, the Color LaserWriter would require around 130 MB of memory. Competitive printers either support lower quality or more memory or both . For example, the Tektronix Phaser 540 requires 36 MB of memory to support 600 dpi "contone quality", which is actually lower quality than what the Color LaserWriter provides in only 12 MB.

Question: How does the performance on the Color LaserWriter compare to the competition?

Answer: For most customers it doesn't matter how fast a document prints if the print page doesn't offer acceptable print quality. Thus while a true Apples to Apples comparison isn't possible because the competition don't offer the quality of the Color LaserWriter, in terms of raw performance the Color LaserWriter is quite competitive.

Apple testing indicates that over a wide range of documents the Color LaserWriter is only 24% slower than the competition with only 12 MB of RAM. With 28 MB of RAM the Color LaserWriter is within 5% of the competitive average. On word processing documents, spreadsheets, images, and multiple copies the Color LaserWriter often outperforms the competition.

There are some types of documents that are slower on the Color LaserWriter -- mostly complex illustrations. On these documents, offering superior 600 dpi near photographic quality doesn't come free... each page inside the Color LaserWriter is 128 MB of compressed data -- 32 times the data as a 300 dpi printer and 16 times a 600 dpi bi-level printer. The fact that the Color LaserWriter can be

competitive on both price and performance with printers offering significantly lower quality is a testament to Apple's innovative controller & software design.

Question: What is Color PhotoGrade and why is it better than the competition?

Answer: Color PhotoGrade is Apple's print quality enhancement technology that provides superior quality images, colored text, and filled areas. It utilizes the engine's ability to provide several shades of each of the four (cyan, magenta, yellow, and black) toner. Color PhotoGrade provides very small halftone cells (colored dots) AND lots of colors resulting in fine detail, smooth transitions, and vibrant colors. It is superior to the competition in three ways:

- It offers near photographic quality images, filled areas, and text
- It offers vibrant and consistent color
- It offers superior quality even on low resolution such as those off a digital camera or a video capture board.

Question: Who supplies the print engine and does Apple have an exclusive on this engine?

Answer: It is a Canon engine. We don't expect to be the only vendor using the engine, but we expect to be first and believe our implementation using the engine will be superior because of the value Apple has added in the controller and software.

Question: Does the printer support Windows 95?

Answer: Yes. The printer will be compatible with the Windows PostScript Level 2 driver that comes with Windows 95. The enhanced print manager support for Windows 3.1 will not be available for Windows 95 so some of the queue functionality available in 3.1 will not be supported in Windows 95.

Question: Why isn't Apple using a PowerPC processor in the printer?

Answer: Apple chooses the best processor for the job. While the PowerPC is a great chip, it wasn't appropriate for the Color LaserWriter given the development cycle and cost goals.

Question: Why doesn't the printer support GX?

Answer: It will. Apple will be shipping a GX driver for the Color LaserWriter.

Question: Why is Contone quality important to normal business users?

Answer: Business users want professional looking output using a variety of

object types including B&W text, color text, color filled areas, and photographs. Even if a user never intends to print photographs, continuous tone makes a significant difference in the quality of output. Colors that are anything but primaries or secondaries are significantly more readable and of higher quality on a continuous tone printer than on a standard printer.

Question: Will the Apple software features be available on competitive products?

Answer: Most will only be available on Apple's printers. Our approach is to an increasing value to Apple printers via software differentiation in the printer, driver and utilities. Many of these features will only be available on Apple printers. We may chose to make certain Macintosh driver features available where we believe they are critical for the Apple platform.

DOS Compatibility Card: MS-DOS MIDI Support (10/96)

=====

Article Created: 5 September 1995
Article Reviewed/Updated: 8 October 1996

TOPIC -----

Does the Power Macintosh 6100 DOS Compatible support MIDI output to the serial port while running MS-DOS or Windows?

DISCUSSION -----

The PCI-based PC Compatibility Cards are the only cards that support MIDI devices. Since the Power Macintosh 6100 is NOT a PCI-based Macintosh, you cannot send or receive MIDI data from the serial port using the DOS Compatibility Card. MIDI data travels internally with MS-DOS/Windows, but the data cannot be transferred from the serial port to a MIDI instrument. However, MIDI transfers are fully supported under the Mac OS.

The PCI-Based DOS Compatibility Cards allow you to use the joystick port to transfer MIDI data. Using a proper MIDI adapter, both the MIDI OUT and the MIDI IN channels will be available. This MIDI adapter is the same standard Sound Blaster-compatible Joystick-to-MIDI adapter that you can find at any MS-DOS/Windows computer store. Apple does not sell this adapter.

Article Change History:
08 Oct 1996 - Reworded for clarity.
17 May 1996 - Added additional information on MIDI adapter.
27 Apr 1996 - Added PCI DOS Compatibility Card information.

AudioVision Display: AudioVision Software 1.0.2 ReadMe (9/95)

=====

Article Created: 5 September 1995

TOPIC -----

This article contains the Read Me file included with the AudioVision 14" Display software version 1.0.2

DISCUSSION -----

AudioVision 14 Display

This document contains the latest information about your AudioVision 14 Display. Read this file in addition to the AudioVision 14 Display User's Guide.

Installing the AudioVision Software

If you use the AudioVision 14 Display with other input devices that include software, such as as the Apple Adjustable Keyboard or certain non-Apple keyboards and pointing devices, install the AudioVision software last. If you don't, software for some other devices may overwrite the AudioVision software.

For example, if you install software for the Apple Adjustable Keyboard after installing the AudioVision software, the keyboard's Sound control panel replaces the monitor's Sound control panel, which contains additional sound controls for your monitor.

IMPORTANT If you have the Apple Adjustable Keyboard: After you install the AudioVision software, restart the computer. Then shut down and turn off the computer and the monitor, wait 30 seconds, and turn them back on. Otherwise, the computer will not recognize the monitor.

Removing the AudioVision Software

The AudioVision software replaces your computer's Sound control panel with a larger Sound control panel. If you remove the AudioVision software, you'll need to add a Sound control panel to your computer either by dragging one to the

System Folder (with the System Folder closed), or by reinstalling your system software. See the manuals that came with your computer for information on reinstalling system software.

Note: If you drag a Sound control panel to your System Folder, you'll be asked if you want it placed in the Control Panels folder, which is inside the System Folder. Click Yes—all control panels belong in the Control Panels folder.

Energy Saver

Energy Saver is a control panel that lets you save energy by choosing to automatically dim your screen when the screen is not being used. You specify how long you want Energy Saver to wait (up to an hour) before turning off the screen. The computer is not turned off, so it only takes a few seconds after you start using your keyboard or mouse for the screen to become fully active.

If your model of Macintosh can support Energy Saver, then it is automatically installed when you install the AudioVision software.

What models support Energy Saver?

You can use Energy Saver if you have the following:

- a Power Macintosh computer, or a Macintosh Quadra, Centris, or LC III computer
- 2 MB of available RAM
- system software version 7.1 or later

IMPORTANT The AudioVision 14 Display complies with Energy Star guidelines. A monitor that does not comply with Energy Star guidelines, or one that is plugged into an expansion card, will not be harmed by the Energy Saver control panel but will not save energy (even if the screen goes black). In some cases, you will not be able to open and use the Energy Saver control panel if your monitor does not comply with Energy Star guidelines.

Setting Up the AudioVision 14 Display for Speech Recognition on the Macintosh Quadra 840AV and Macintosh Centris 660AV

If you use the AudioVision 14 Display with the Quadra 840AV or Centris 660AV for speech recognition, follow these steps when you set up your AudioVision display:

1. When connecting the AudioVision adapter cable, connect the sound-in plug to the external sound input port on the back of the computer.
2. Make sure the AudioVision monitor's built-in microphone is turned on.

Alert and Beep Sound Problems

Missing alert sound

If you turn the AudioVision monitor's speakers all the way down, you may accidentally turn off your computer's alert sound (the beep you hear when the system needs to get your attention). There are three ways to turn the speakers completely down:

- dragging the AudioVision Speakers slider all the way down in the Volumes portion of the Sound control panel
- turning the volume all the way down on the monitor itself (using the monitor's Volume key)
- turning on the monitor's Mute option

If you have the Apple Adjustable keyboard, there is a fourth way to turn the sound down:

- using the keyboard's volume key

If you use any of these methods to turn the sound all the way down, any adjustments you make to the Alert slider in the Sound control panel will have no effect. You will hear no alert sounds. If the Alert slider is also turned all the way down, the system will alert you by flashing the menu bar. If, however, the Alert slider is turned up, but the speakers are turned all the way down, your system will not recognize that the alert sound cannot be heard, and won't flash the menu bar.

Inaudible startup beep

If you use the AudioVision 14 Display with the Macintosh IIfx, IIfx, IIfx, Quadra 700, 800, 900, or 950, you may not hear the startup ("boot") beep when you turn on the computer. To hear the startup beep, plug the monitor into a wall outlet (not into the computer) and turn on the monitor before turning on the computer.

If you have a Power Macintosh computer, plug the AudioVision Display into the back of the computer, not into a wall outlet.

Recording With External Microphones

The Apple Microphone does not work with the AudioVision 14 Display. If you wish to use an external microphone, use the Apple PlainTalk microphone.

Video Slider Behavior With Keypad Control Combinations

Pressing the Volume key, Mute button, or Microphone-On button in combination with the Brightness key or the Contrast key makes the slider behave erratically. For example, if you press and hold the top of the Contrast key to move the slider control upward and press the Mute button at the same time, the slider control continues upward to the end—even after you release the keys.

PCI Cards: How To Tell If They Are Macintosh Compatible (9/95)

Revised: 9/6/95
Security: Everyone

PCI Cards: How To Tell If They Are Macintosh Compatible (9/95)

=====

Article Created: 5 September 1995

TOPIC -----

How can I tell if a particular PCI expansion card is compatible with my Power Macintosh 8500?

DISCUSSION -----

PCI expansion cards that are compatible with your Macintosh have a blue sticker on the box indicating that the card is "Designed for Macintosh computers with PCI." The shape of the sticker is similar to those used for Power Macintosh native applications and Macintosh computers that are upgradeable to PowerPC.

Power Macintosh 7200, 7500, 8500, 9500: Pinouts (6/96)

Revised: 6/27/96
Security: Everyone

Power Macintosh 7200, 7500, 8500, 9500: Pinouts (6/96)

Article Created: 6 September 1995
Article Review/Updated: 27 June 1996

TOPIC -----

This article presents the pinouts for Power Macintosh 7200, 7500, 7600, 8500, and 9500 series computers. These pinouts include: PCI connector, video connector, serial port (GeoPort), SCSI, ADB, Ethernet, SCSI, Ram DIMM connector, Level 2 cache, DAV connector, S-video input, and S-video output.

DISCUSSION -----

PCI connector

Power Mac 7200: Command/Option Keys Stuck At Wake Up (12/95)

Article Created: 6 September 1995
Article Review/Updated: 19 December 1995

TOPIC -----

I use the keyboard shortcut Command-Option-Power to force my Power Macintosh 7200 computer to go to sleep. However, when the computer wakes up, the Command and Options keys are still pressed down. Is there any way to avoid this?

DISCUSSION -----

There are three workarounds for this situation:

- 1) Choose Sleep from the Special menu instead of using the Option-Command-Power keyboard shortcut.
- 2) Press the Power button. This brings up the Shut Down dialog box. Sleep is an option within the Shut Down Dialog box.
- 3) Press the Option-Command-Power keys to force the system to shut down. After waking the computer up, press the Command and Option keys to bring them keys back to their up position.

This symptom will be fixed in the next system software update.

ColorSync: Which Profile Should I Use for My PowerBook? (10/95)

Article Created: 6 September 1995
Article Reviewed/Updated: 9 October 1995

TOPIC -----

Which ColorSync System Profile should I select in the ColorSync System Profile control panel for my PowerBook?

DISCUSSION -----

Begin_Table

If you have this PowerBook	Select this profile
-----	-----
180c, 540c, 5300c, 5300ce	PowerBook 180c Standard
165c, 520c, 5300cs	PowerBook 165c Standard
270c, 280c, 2300c	PowerBook 270c Standard

End_Table

Non-color PowerBooks do not use ColorSync.

Power Macintosh: How To Display Less Than 256 Colors (9/95)

Revised: 9/7/95
Security: Everyone

Power Macintosh: How To Display Less Than 256 Colors (9/95)

=====

Article created: 7 September 1995

TOPIC -----

I have attached a monitor to the DB-15 video port on the back of my Power Macintosh 7100/80. Why can't I display less than 256 colors?

DISCUSSION -----

Monitors attached to the High Performance Video (HPV) card on Power Macintosh 7100 and 8100 series computers cannot display less than 256 colors.

To display less than 256 colors, you must connect your monitor to the HDI-45 video port. Using this port allows your monitor to access the built-in DRAM to display images. A video adapter cable (Part #M2681LL/A)* is needed to connect a monitor with a DB-15 connector to the HDI-45 video port.

The Power Macintosh AV Card also has the ability to display less than 256 colors.

QuickTime: Playback Speeds Up With the Step Button Down (9/95)

Revised: 9/7/95
Security: Everyone

QuickTime: Playback Speeds Up With the Step Button Down (9/95)

=====

Article Created: 7 September 1995

TOPIC -----

I notice that QuickTime movies run smoother and faster if I click and hold the step forward button than if I just let the movie play. I also discovered that movies run much smoother if I click and hold the play button. Once I let go of the play button, the movie starts to play a bit jerkier. Why is this occurring?

DISCUSSION -----

When you click once on the step forward, it advances a single frame. When you hold it down, it advances through the frames as fast as it can draw them while ignoring the sound track.

This is a good way to find out how close a movie is to the limit of what your given computer can play. If holding down the button speeds it up a small amount, you are near the limit of your computer's playback performance. If it doubles in speed, your particular computer can handle movies with higher frame rates, screen size, or sound depth.

MegaPhone: How to Record Outgoing Message (10/95)

Revised: 10/9/95
Security: Everyone

MegaPhone: How to Record Outgoing Message (10/95)

=====

Article Created: 7 September 1995
Article Reviewed/Updated: 9 October 1995

TOPIC -----

Do I have to leave my computer on in order for MegaPhone to answer a telephone call?

I am unable to get MegaPhone to record an outgoing message. How do I set this up properly?

DISCUSSION -----

To use your Macintosh as an answering machine, your computer must be on and the MegaPhone application running. Megaphone can be running in the background when the call comes in. Your Global Village internal modem automatically handles arbitration between the GlobalFax and MegaPhone software.

To setup the software so the modem will determine what type of call is coming in, open the Telephone Setup control panel and select the "Auto-answer incoming calls after 4 rings" option. This selection will direct the incoming call to the appropriate software, whether the call is either voice, or fax.

Follow these steps to record the outgoing greeting your callers will hear:

Step 1

Launch MegaPhone.

Step 2

You can reach the area to record an outgoing message by two routes:

A. Pull down the File menu and choose Preferences.
Select Voice Messaging from the Topic pull down menu.

or

B. From the Windows menu select "Voice Messages" and click the Setup button in the top right corner of the Voice Messages window.

You are now in the Voice Messaging Preference window.

Step 3

Make sure you have placed an "X" next to "Use MegaPhone Voice Messaging" otherwise, you will not be able to record your greeting.

Step 4

Check if there is a greeting already recorded by clicking the Play button in the Outgoing Message area of the window. You will hear the original MegaPhone greeting if you have not recorded a previous one. If you do not hear it, check the volume level of your computer in the Sound control panel, or if you have a computer with volume control buttons, press the volume up button to make sure you hear your system sounds.

Step 4

If you do not hear the greeting or you do not hear any system sounds, make sure that your microphone is not connected to the speaker port, as this will not allow sounds to play or be recorded. Make sure your microphone is plugged into the port with the microphone icon.

Step 5

In the Outgoing Message area, click the Record button. You should hear MegaPhone speak and your computer say "Record your new greeting at the tone," followed by a short tone. If you do not hear MegaPhone tell you to record your greeting, we would suggest following Step 6 below to remove the "Voice Mail Sounds" file. Afterwards, test it again.

Record your announcement and then click the Stop button. Click the Play button to hear your recording. You should hear your message.

If you hear nothing, check your sound input in the Sound control panel:

- 1) Under the Apple Menu, choose control panels.
- 2) Double-click the Sound Control Panel.
- 3) Choose the Sound In option from the pull down menu in the control panel window.
- 4) Click the Options button.
- 5) Change the input source to microphone.
- 6) Click OK.
- 7) Choose the Alert Sounds option from the pull down menu in the control panel window.
- 8) Click Add.
- 9) Tap your microphone and look for the sound waves coming from the speaker icon to confirm it is receiving input.

Step 6

MegaPhone comes with its own prerecorded greeting that states "Hello, thank you for calling. Please leave your message at the tone." This message will be erased as soon as you record your own new greeting.

If you would like to go back to this original greeting, quit MegaPhone and delete the file "Voice Mail Sounds" from your computer. The file is located at the following path: Hard Disk -> System Folder -> Preferences -> Cypress -> MegaPhone -> Voice Mail Sounds. Move it to the Trash, empty the Trash, and then relaunch MegaPhone. A new Voice Mail Sounds file will be created automatically. Please note that this will erase any outgoing message you recorded.

If you are still unable to record a greeting, reinstall MegaPhone from your Macintosh Performa CD. Use the search string "performa and restore" to locate the TIL article "Performa: Backing Up and Restoring" for additional information.

NOTE:

MegaPhone comes bundled on the following systems:
Performa 6200CD, 6216CD, 6218CD, 6220CD, 6230CD
Performa 5215CD

Open Transport 1.1: Should Be Used (4/96)

Revised: 4/15/96
Security: Everyone

Open Transport 1.1: Should Be Used (4/96)

Article Created: 7 September 1995
Article Reviewed/Updated: 15 April 1996

TOPIC -----

This article recommends using Open Transport 1.1 on Power Macintosh 7200, 7500, 8500, and 9500 computers which have a PCI bus.

DISCUSSION -----

Open Transport 1.1 or the latest version is recommended for all Power Macintosh computers with a PCI bus, including the Power Macintosh 7200, 7500, 8500, and 9500. It will be especially valuable if you use SLIP or PPP to access the Internet, or other TCP/IP resources.

The first release of System 7.5.2 which shipped with the first Power Macintosh 9500 computers did not include a piece of code called the ".enet shim", or in other words, an .enet Compatibility Module. This shim is required for applications such as MacIPX, SoftPC networking, DECnet and others to interact with Open Transport.

The .enet shim is no longer needed for compatibility after upgrading to Open Transport 1.1.

Article Change History:
15 Apr 1996 - Updated to Open Transport 1.1.
21 Nov 1995 - Updated to Open Transport 1.0.8.

Apple Presentation System: Won't Work w/DOS Compat Card (9/95)

Revised: 9/7/95
Security: Everyone

Apple Presentation System: Won't Work w/DOS Compat Card (9/95)

=====

Article Created: 7 September 1995

TOPIC -----

I want to use the Apple Presentation System with my DOS Compatibility Card, but I cannot get it to work. Is there a way to do this?

DISCUSSION -----

These two systems cannot work together. The DOS Compatibility Card changes the characteristics of the video signal when displaying a MS-DOS/Windows screen image. These changes may vary based on the monitor that is attached, and the settings in the PC Setup control panel.

The Apple Presentation System is not be able to handle the differences in the video signal. The Apple Presentation System expects a 640x480 67-Hz Macintosh signal, but it is receiving a 640x480 60-Hz VGA signal when using MS-DOS or Windows.

Global Village: Red 'X' at Startup (9/95)

Revised: 9/8/95
Security: Everyone

Global Village: Red 'X' at Startup (9/95)

=====

Article Created: 8 September 1995

TOPIC -----

I have a Global Village modem and there is a red 'X' across the modem icon on startup. What should I do?

DISCUSSION -----

A red 'X' across the modem icon indicates that the modem software did not load properly. This could be due to a corrupt preference file, damaged modem software, or even a duplicate versions of the modem extensions in the System Folder. Follow the steps listed below to resolve this issue.

Step 1

Open the System Folder and the Global Village Personal folder. Move the files Queue Temp and GlobalFax Preferences to the Trash and restart your computer. This will essentially recreate these files on startup incase one of the files was accidentally damaged. Empty the Trash once you restart the computer to delete the old files.

Step 2

Check your System Folder for duplicate Global Village modem extensions. If you accidentally moved some of the modem extensions to the System Folder then reinstalled the system software you may have duplicate extensions. Delete the duplicate items to prevent the red 'X' from appearing on the modem extension. The following extensions should only be installed once in your Extensions folder:

Global Village Toolbox
GlobalFax

Step 3

If the above troubleshooting steps fail to resolve your issue, then reinstall the Global Village software from your Performa CD or set of software backup disks to ensure that you have all the necessary files.

AV Digitizer Options: Read Me (9/95)

Revised: 9/14/95
Security: Everyone

AV Digitizer Options: Read Me (9/95)

=====

Article Created: 8 September 1995

TOPIC -----

The following article is the ReadMe file for the AV Digitizer Options extension.

DISCUSSION -----

AV Digitizer Options Notes

Notice: This software is copyrighted by Apple Computer, Inc. You may freely distribute this software as long as you do not charge for it and as long as this notice accompanies the AV Digitizer Options file. This software is distributed as is and is not supported by Apple.

More legalese: Apple Computer, Inc. does not endorse, warrant, guarantee, or make any representations, express or implied, with respect to this software, its quality, performance, merchantability, or fitness for a particular purpose. In no event will Apple be liable for direct, indirect, special, incidental, or consequential damages resulting from the use of this software.

Description:

The "AV Digitizer Options" extension is a "video panel component" for use with the Macintosh Quadra 840AV, Quadra 660AV and the Centris 660AV. It provides access to several capabilities of the AV video hardware that are not easily accessed otherwise:

1. It allows the user to switch the color space of the live video window from 16bpp color to 8bpp grayscale. Note that in monitors with a resolution higher than 832 x 624, video will only be displayed in 8bpp grayscale. This is a hardware limitation.
2. It allows the user to select 1 of 7 different levels of transparency for the live video. This means that when you superimpose a graphics window in front of the live video window, the live video can "blend" with the graphics at 7

different levels: (% Graphics / % Video) 100%/0%, 75%/25%, 62%/38%, 50%/50%, 38%/62%, 25%/75%, and 0%/100%. Please note, that this feature is only available when the graphics is in 256 colors or grays.

3. It allows the user to bypass the Inverse Gamma lookup table in the Digital Video Scaler. When the lookup table is bypassed the video data written to VRAM will not be modified. Note that there is another lookup table in the output end that only affects the displayed data (Not the captured video data). This lookup table has the same Gamma correction as that of the displayed graphics. In order to bypass that table, go to the Options dialog of the monitors control panel, while holding the option key. Select the "Uncorrected Gamma" as the gamma table.

Installation:

Drag the file into the Extensions folder of your system and reboot the machine. You can access the features through the "Video Settings..." menu item of any QuickTime 1.5 or higher aware application.

Extra Notes:

Presently, most video applications will stop live video playthrough when they are switched into the background. This is because if they don't, the video will blast through any windows that are in the front. However, the AV hardware has a dual frame buffer architecture that avoids the need for stopping the video. Thus transparency will not work in these applications. The only shipping application that I know that allows video-playthrough while in the background is Video Monitor, from Apple.

Power Macintosh 8500: Unable To Display Video On TV (10/95)

Revised: 10/14/96
Security: Everyone

Power Macintosh 8500: Unable To Display Video On TV (10/95)

=====

Article Created: 8 September 1995
Article Reviewed/Updated: 9 October 1995

TOPIC -----

I have a Power Macintosh 8500. In addition to my computer monitor, I have attached a television to the correct ports on the back of the computer, but I cannot seem to get the video to display on the television. I get video on my computer monitor, but my television is black. What am I doing wrong?

DISCUSSION -----

The Power Macintosh 8500 can be configured with either 2 or 4 megabytes (MB) of video random-access memory (VRAM). Troubleshooting the problem depends on how much VRAM is installed in your computer.

2 MB of VRAM
=====

If your Power Macintosh 8500 is equipped with 2 MB of VRAM, you can display video on either a computer monitor or a television, but not both at the same time. The computer detects what type of display device is attached when starting up and makes the proper adjustments. The computer defaults to the monitor when both a monitor and television are attached, hence the television screen will be black. Follow these directions to display video on a television from your computer:

Step 1

Make sure that your computer and television are both turned off.

Step 2

Disconnect your computer monitor from the video port on the back of the computer.

Step 3

Connect the television to the composite or S-video out connectors on the back of the computer.

Step 4

Turn on the television.

Step 5

Start up your computer.

Step 6

The video now appears on your television.

If, after following these steps, there is still no image on the television, you need to make sure that the VRAM Dual Inline Memory Modules (DIMMs) are installed in the slots labelled "1" on the logic board. If the VRAM DIMMs are installed in the slots labelled "2", the video out feature does not work.

If you want to use both the television and monitor at the same time, you need to add an additional 2 MB of VRAM to your computer. If you install additional VRAM you can also use a larger desktop, or use video mirroring for presentations and recording.

4 MB of VRAM

=====

If your Power Macintosh 8500 is equipped with 4MB of VRAM, you can view the desktop on both the monitor and the television. If no image appears on the television, you need to open the unit and check the video cable connections.

Troubleshooting

=====

WARNING: Your computer contains electrically sensitive parts. To avoid damaging your computer, discharge static electricity that may be on your clothes or body by touching the power supply case before working with the assembly.

The following troubleshooting directions are provided primarily for Apple Service providers. If you attempt to perform upgrades or repairs yourself, any damage you may cause to your equipment will NOT be covered by your warranty.

Examine the internal AV ribbon cable and make sure it is attached between the logic board and the external composite and S-video connectors on the back panel of the computer. The internal ribbon connector must be attached to the logic board for the detection circuitry to operate properly. If the cable is not connected properly, reconnect the internal cable to correct this problem.

ADB Mouse: Sticking In The Down Position (9/95)

Revised: 9/15/95
Security: Everyone

ADB Mouse: Sticking In The Down Position (9/95)

=====

Article Created: 8 September 1995
Article Reviewed/Updated: 15 September 1995

TOPIC -----

Sometimes my mouse seems to stick in the down position. For instance, I can click the scroll arrow in a window, and the window keeps scrolling until I click the mouse again. How can I correct this problem?

DISCUSSION -----

The symptoms you are describing could be caused by either hardware or software problems. Attempt to eliminate software first, then troubleshoot your hardware.

Try these steps in the order presented. If a step fails to correct the problem, proceed to the next one.

Step 1

Restart your computer. Many times simply restarting fixes the problem.

Step 2

Restart and turn off all extensions. If the problem goes away, troubleshoot your extensions.

Step 3

Shut down your computer, but leave the power supply to the computer turned on. Switch off any SCSI devices and completely disconnect all Apple Desktop Bus (ADB) cables and devices attached to your computer. Wait at least 10 seconds, reattach the ADB cables and devices, and restart your computer.

WARNING:

Do not disconnect ADB devices while the computer is turned on.

Step 4

Zap (reset) the PRAM (Parameter RAM) by holding down the Command-Option-P-R keys at startup.

Step 5

Replace the ADB cables and devices.

Apple Video Player: ReadMe File (9/95)

Revised: 9/8/95
Security: Everyone

Apple Video Player: ReadMe File (9/95)

=====

Article Created: 8 September 1995

TOPIC -----

This article contains the Read Me file included with the Video SW
Installer 1.3.2

DISCUSSION -----

Important Information About Apple Video Player

This document provides important information about the Apple Video Player software. You may want to print this document and keep it with your manuals. Most of this information is not in the documentation. If you have questions that are not answered in this document, refer to the manuals that came with your computer.

After you finish reading this document, you can close it by clicking the small box at the upper left of the document window, by typing Command-Q, or by selecting Quit from the File menu.

Video Quality

Video viewing and video capture is supported in window sizes of up to 640x480 pixels. For the highest-quality video and TV viewing, use the standard video window sizes (Smallest, Normal, or Largest) in Apple Video Player's Windows menu. If you choose to customize the window size (by choosing Other in the Windows menu), the image's resolution may decrease.

In addition, video resolution is optimized when you view the Apple Video Player video window on the monitor connected to the monitor port on your Macintosh. You can drag the video window to a secondary monitor (connected to an expansion card), but the image resolution will decrease.

Hot Key and MacroMedia Director

The Apple Video Player application program allows you to use a keyboard shortcut, called a "hot key," to open and quit the program, and to switch between Apple Video Player and any other open programs. However, due to a minor incompatibility problem with MacroMedia Director, the Apple Video Player hot key does not work when MacroMedia Director is open.

If you are installing Apple Video Player for the first time, no hot key is defined. You can set one using the Hot Key item in the Setup Menu. If you are replacing a previous version of Apple Video Player, the hot key setting is retained in the Apple Video Player Preferences file.

Closed Captioning

If you have a TV tuner card, the Apple Video Player application program can display closed captions for TV channels that provide them. However, in order for closed captions to be visible, the video window size must be set to Normal Size or greater. Also, for best results, networking or printing should not be active when close captioning is selected.

Capturing Movies

Likewise, for best results, networking or printing should not be active when you are recording video from either television or an alternate video source. Virtual memory should also be turned off when capturing video for best results.

Movies are captured at the current volume setting. Set the volume to the desired level before recording a movie. Movies recorded when the sound is muted will not have any sound.

Forgetting Your Password

If you cannot remember your password, you may reset the password by removing the Apple Video Player Prefs file. To remove the Apple Video Player Prefs file, quit Apple Video Player and move the Apple Video Player Prefs file to the Trash. The Apple Video Player Prefs file is located in the Preferences folder, which is in the System Folder.

QuickTime 2.1: About QuickTime 2.1 ReadMe File (9/95)

Revised: 9/12/95
Security: Everyone

QuickTime 2.1: About QuickTime 2.1 ReadMe File (9/95)

=====

Article Created: 12 September 1995

TOPIC -----

This article contains the Read Me file included with QuickTime 2.1 available on online services.

DISCUSSION -----

Welcome to QuickTime 2.1

The QuickTime system software extension enables you to integrate video, graphics, sound, sprites, text, music, and animation into documents. By providing a standard way for all Macintosh programs to control these multimedia elements, QuickTime makes them easier to use. QuickTime 2.1 includes support for smoother video, sprite animation, CD-ROM AutoStart, 16-bit audio compression, and MPEG. It also includes the capabilities of the Apple Multimedia Tuner.

You do not interact directly with the QuickTime extension. It works behind the scenes as part of your system software, providing new features to application programs that support QuickTime, such as MoviePlayer and SimpleText. The specific features of QuickTime and how they are presented depend on the applications you use.

The QuickTime 2.1 release includes:

- the QuickTime extension
- the QuickTime PowerPlug extension for Power Macintosh
- the QuickTime Musical Instruments extension

To Install QuickTime 2.1:

=====

Step 1

Locate the System Folder on your hard disk. Open the System Folder by double

clicking on its icon.

Step 2

Locate the Extensions folder inside your System Folder. Open the Extensions folder by double clicking on its icon.

Step 3

If there is a copy of the QuickTime extension in the Extensions folder, drag it to the Trash. Note: do not empty the trash until you restart your Macintosh.

Step 4

If there is a copy of the Apple Multimedia Tuner extension in the Extensions folder, drag it to the Trash.

Step 5

Close the Extensions folder. Close the System Folder.

Step 6

Drag the QuickTime, QuickTime PowerPlug, and QuickTime Musical Instruments icons to your hard disk's System Folder icon (not into the open folder).

Step 7

Click OK in the dialog box that appears.

Step 8

Restart your Macintosh.

Visit the QuickTime site on the World Wide Web:

=====

More information on QuickTime can be found on Apple Computer's QuickTime site on the World Wide Web. The address is: <http://quicktime.apple.com>.

For Software Developers:

The QuickTime 2.1 Developer Kit, available in the Fall of 1995, includes tools for creating and editing movies, compressing audio, and creating sprite movies. It also includes sample movies such as music movies, MPEG movies, sprite movies, and technical documentation. It is available from the Apple Programmers and Developers Association (APDA) for \$195.

APDA:

Power Macintosh: Networking Options (9/95)

Revised: 9/13/95
Security: Everyone

Power Macintosh: Networking Options (9/95)

Article Created: 8 September 1995

TOPIC -----

I would like to network two Power Macintosh computers together. These computers are located a few houses away from each other. Can we use the built-in networking features of the Macintosh to connect these two computers? What about connecting them via the phone lines?

DISCUSSION -----

You can use the built-in networking capabilities of your Power Macintosh computers to communicate but there are some limits to how far one can run network cabling. You can use Apple's Remote Access (ARA) software to connect your two Macintosh computers via modems.

There are three methods you can use to have your Macintosh computers communicate:

- LocalTalk - directly networking the two computers using LocalTalk via unshielded RJ-11 cabling
- Ethernet - directly networking the two computers using shielded, 10-base-2 (thin coax) Ethernet cabling
- ARA - using Apple's Remote Access software to connect the two computers by modem.

You need to consider required network performance, distance between computers, difficulty in running cabling, and how much money you are willing to spend when choosing which method works best in your situation.

Additional Hardware Needed

=====

LocalTalk

The first networking method would require you to purchase a LocalTalk RJ-11 Connector Kit (M1657Z/A) for each computer. This kit is manufactured by Apple

but there are solutions available from third parties.

Ethernet

There are several different Ethernet networking schemes, including 10-Base-T (twisted pair), 10-Base-2 (thin coax), and 10-Base-5 (thick coax). Each have their advantages and disadvantages, but thin coax allows the longest cable length and does not require an additional hardware hub or router making it a good choice for a low cost solution.

To use thin coax, you need to purchase one Apple Ethernet Thin Coax Transceiver (M0329Z/B) for each computer.

You can attach the transceiver directly to the built-in Ethernet port on your Power Macintosh computer. However, if the computer you are connecting to does not have an Ethernet port (all Power Macintosh computers and most Macintosh Quadra computers have an Ethernet port), your neighbor will either need to add Ethernet functionality to his computer (with an Ethernet card) or you will have to use either the LocalTalk or Modem networking scheme instead.

ARA

If you want to use Apple's Remote Access software and existing telephone lines, each computer would require a modem. Although any Macintosh compatible modem will work, modems capable of 14.4 kilobytes per second (kbps) or greater data transfer rates are preferred. You also need to purchase one copy of Apple Remote Access Personal Server software v2.0.1 (M2726Z/B). This software package includes license for one client to log on to your computer. If you want to allow additional users to access your computer, you need to purchase one copy of Apple Remote Access Client v2.0.1 (M5227Z/B) for each user.

Cabling

=====

Depending on which method you choose, you will need specific cabling.

LocalTalk

LocalTalk uses unshielded, RJ-11 cable. This type of cable is similar to regular phone cable. However, it would be best to purchase this cable from a computer cable shop as one continuous cable without any extending connectors.

The problem you may encounter with this method is that RJ-11 cable is usually unshielded against external interference. This means the two computers may have difficulty communicating with one another due to outside interference, such as nearby broadcasting transmitters or high-voltage power lines. However, you may be able to locate shielded RJ-11 cabling for greater reliability. The maximum limit on cable length using this method is approximately 1000 feet. Repeaters can also be used if distances are greater, or if you are experiencing weak signals. The longer your cabling, the more likely you are to encounter interference.

Ethernet

Ethernet is considerably faster than LocalTalk. Thin coax Ethernet uses shielded coax cable, similar to cable used by most cable television installers. Be sure to use RG-58 Ethernet cabling, not the RG-62 used by most cable TV installers. RG-58 cable is less susceptible to interference. The overall cable length of this type of network is approximately 600 feet.

ARA

No additional cabling is necessary since you are using modems and existing phone lines.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

MegaPhone Rings For No Reason (9/95)

Revised: 9/13/95
Security: Everyone

MegaPhone Rings For No Reason (9/95)

=====

Article Created: 13 September 1995

TOPIC -----

Occasionally, while using MegaPhone on a Macintosh Performa 6200CD series computer, MegaPhone will make a ring noise when there is no incoming call or while I am already using it to take a call. It will still ring properly when an actual call is being received. What could be happening to cause this?

DISCUSSION -----

This may be a perception issue, but we will give as many possible solutions as we can. Make sure that it is actually MegaPhone which is causing the ring and not your Macintosh computer giving you an error message accompanied by the sound of the phone ringing. Are any of the occasions accompanied by a dialog box? For example, when your computer needs to give you a message, it will also play the alert sound which is selected in the Sound control panel.

Open your Sound control panel and see which alert is selected. If one of the MegaPhone sounds, such as "Bell Telephone", "Electronic Telephone", or "Melodic Ring", is selected, then that is the sound an alert on your Macintosh computer will play. Select another alert sound to avoid confusion. You may also choose a different ring sound for an incoming call for MegaPhone by opening the Telephone Setup control panel and changing the Ring Sound option.

A good way to test for this would be to start your computer and then let it sit idle. Listen to see if it makes the ringing sound. If it does not, it is likely you are just hearing an alert sound while you are working.

If the alert sound selected is not one of the MegaPhone sounds or if MegaPhone is really playing the ring sound when there is no incoming call, open the System Folder and then open the Preferences folder. Open the Cypress folder and then open the MegaPhone folder. Drag the MegaPhone Prefs file to the Trash. Restart your computer and test it again. A new preferences file will be created the next time you use MegaPhone.

MAE: asdtool Utility Converts Macintosh File Formats (9/95)

Article Created: 13 September 1995

TOPIC -----

This article provides information on asdtool a new Macintosh Application Environment (MAE) utility.

DISCUSSION -----

Apple is pleased to announce the availability of a new utility for use with Macintosh Application Environment, 'asdtool'.

asdtool converts AppleSingle file format to AppleDouble and vice-versa. It can optionally translate carriage returns to linefeeds and handle double-byte characters, such as Kanji. asdtool determines the file format and, following conversion, adds a suffix of _sgl or _sbl as appropriate. For complete information, please read the man page supplied in the tar distribution.

asdtool is covered under the 'APPLE SOFTWARE LICENSE AGREEMENT' which is supplied with MAE.

asdtool and other utilities are available from 'support.apple.com' using FTP. The asdtool can be found in the directory /pub/mae/utilities. For more information, please see the README contained in the same directory.

PhotoFlash 2.0: White Images Instead of Pictures (9/95)

=====

Article Created: 13 September 1995

TOPIC -----

This article contains information on a problem with PhotoFlash 2.0 after QuickTime 2.1 is installed on a Macintosh computer.

DISCUSSION -----

After installing QuickTime 2.1, PhotoFlash 2.0 displays blank white images instead of pictures. To correct this you must reinstall PhotoFlash 2.0, then install the PhotoFlash patcher, then re-start.

System 7.5.2: Which Software Updates Do I Need? (6/96)

Revised: 6/3/96
Security: Everyone

System 7.5.2: Which Software Updates Do I Need? (6/96)

Article Created: 13 September 1995
Article Reviewed/Updated: 3 June 1996

TOPIC -----

Are the Apple Menu Options 1.0.2 control panel and Sound Manager 3.1 extension compatible with System 7.5.2? My Macintosh computers running System 7.5.2 have older versions of these system resources, but I am unable to determine if these later software releases are compatible. Will they work?

What other updates do I need?

DISCUSSION -----

These updates will work on all the computers that shipped with System 7.5.2, however, each computer series needs to have different updates installed.

Apple recommends you install the System 7.5 Update 2.0 software which includes each of these updates and will install over the original 1.0 version of the System Enabler 7.0.1 on the Power Macintosh 9500 computers. The System 7.5 Update 2.0 can be obtained from the Apple Order Center.

Some of these updates are integrated into other parts of the system software. Review the "System 7.5 Update 2.0: What's New in This Update" files installed by the update for more information.

The following are included in the System 7.5 Update 2.0:

- Power Macintosh 9500 systems running version 1.0 of System Enabler 701 should use System 7.5 Update 2.0. This CD includes Open Transport 1.1, Apple Menu Options 1.1.2, and many other updates.
- Apple Menu Options 1.1.2 is updated and available in this update.
- Power Macintosh 7200 and 9500 customers no longer need to add Sound Manager

3.1 separately. This extension is built into the update and does not need to be installed separately on these computers.

- All computers with System 7.5.2 and Open Transport should update to Open Transport 1.1 available as part of this update.
- The System 7.5.2 Printing Update version 1.1 addresses a printing problem that may occur on Power Macintosh 7200, 7500, 8500, and 9500 computers using System 7.5.2. Without this fix, your computer may freeze if you attempt to print on a network-based printer that is already busy. The update is comprised of 7.5.2 Printing Fix, LaserWriter 8.3.2, and SerialDMA. All three components are incorporated in this update.
- If your computer is using a built-in Ethernet port to connect to your network, you should install this update. The update incorporates the Built-in Ethernet extension and fixes an issue that may occur on Power Macintosh 7200, 7500, 8500, and 9500 computers when transferring large files to AFP servers. The symptom is the transfer fails with a -1072 error and the computer disappears from the network.
- If you use Desktop Printing Software on your Power Macintosh 7200, 7500, 8500, or 9500 series computer, you should use this update.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

03 Jun 1996 - Updated for technical accuracy.

27 May 1996 - Updated for technical accuracy.

20 May 1996 - Added reference to updates in System 7.5 Update 2.0.

Find File: in the Finder Selection Dimmed (9/95)

Revised: 9/13/95
Security: Everyone

Find File: "in the Finder Selection" Dimmed (9/95)

=====

Article Created: 13 September 1995

TOPIC -----

I am using a Macintosh computer with System 7.5. When I use the Find File application, the "in the Finder Selection" item in the "Find Items" pop-up menu is dimmed. I would like to use that option so I can constrain my searches to specific folders or disks. What should I do?

DISCUSSION -----

First, you must have a Finder item selected before that option will appear in the Find File pop-up menu. If you have made sure that either a volume, folder, or floppy disk is selected (dark or highlighted) and you still do not see the option of "in the Finder Selection" then you should make sure the Finder Scripting Extension is loaded in your system software.

If you have moved your Finder Scripting Extension out of your Extensions folder, or disabled it using the Extensions Manager, the "in Finder Selection" option will be dimmed. To resolve this issue:

Step 1

Use the Find File application to find the Finder Scripting Extension.

If the Finder Scripting Extension has been deleted from your computer, you should restore your system software from your System 7.5 installation disks, Performa CD, or Apple Backup disks.

Step 2

Make sure the Finder Scripting Extension is inside your Extensions folder. If it is anywhere else on your hard drive, drag it to your closed System Folder, click OK when asked if you want it placed where it belongs.

Step 3

Restart your Macintosh, hold down the spacebar on the keyboard until the Extensions Manager window opens. If there is not a checkmark to the left of the Finder Scripting Extension, click on the words Finder Scripting Extension to put one there.

Step 4

Close the Extensions Manager by clicking on the box in the upper left corner.

Performa: Power Pete Out Of Memory (9/95)

Revised: 9/15/95
Security: Everyone

Performa: Power Pete Out Of Memory (9/95)

Article Created: 14 September 1995
Article Review/Updated: 15 September 1995

TOPIC -----

I have a Performa computer that came bundled with the Power Pete program. Sometimes I can successfully launch Power Pete, at other times I get a message telling me I need more memory. Why is this happening, and what can I do to prevent it from happening again?

DISCUSSION -----

The Power Pete program comes preset to request 5113K of Random Access Memory (RAM), an amount that may sometimes exceed the memory your computer has available for programs. If you have less than 5113K of available memory, you cannot launch Power Pete. You can check the available memory in the Largest Unused Block area of the About This Macintosh dialog box under the Apple menu. The amount of memory used by your system software varies depending on a number of factors.

Workarounds

Restart your computer

Simply restarting your computer clears the memory and resets the system software back to its original size. Check the Largest Unused Block area of the About This Macintosh dialog box under the Apple menu to make sure you have at least 5113K available.

Disable extensions

Disabling some of your extensions using the Extensions Manager control panel also reduces the amount of memory used by your system software. Remove the check mark next to any extensions you do not need. Power Pete does not require any extensions to run, but some of your other programs may require certain extensions. Once you have turned off some extensions, you can save the set by

selecting "Save set..." from the pop-up Sets menu in the Extensions Manager control panel. You may then choose the set you want to enable, and restart your computer. Check the About This Macintosh dialog box again to see if you have at least 5113K available.

Restart with all extensions off

Since Power Pete requires no extensions, another option is to restart your computer with all extensions turned off. To do this, restart your computer and hold down the Shift key until you see the message "Extensions off" appear at the "Welcome to Macintosh" screen. Disabling all extensions greatly reduces the memory used by your system software, so you have much more RAM available for programs. Again, check the About This Macintosh dialog box to see if you have at least 5113K available.

Allocate less memory to Power Pete

Another option is to allocate less memory to the Power Pete program. Decrease both the Preferred and Minimum memory requirements to 4500. You may see a message warning you that the program may crash. Keep in mind that not all the game's features may work correctly when configured in this manner. For example, the game may not be able to play all of its sounds. While this is not necessarily the best solution, it will at least allow you to play the game.

Install more RAM

The best solution is to install more memory.

MAE: asdtool For AppleSingle & AppleDouble Conversion (9/95)

Revised: 9/14/95
Security: Everyone

MAE: asdtool For AppleSingle & AppleDouble Conversion (9/95)

=====

Article Created: 14 September 1995

TOPIC -----

I would like to edit a file that was saved in MAE with a UNIX application, however, I am unable to work with the file. I understand that MAE uses AppleSingle format to save files to the UNIX file system. How can I work with these files (like PICT, JPEG, and text) in UNIX without always starting up MAE with the -filedouble option?

DISCUSSION -----

UNIX programs, like vi, do not expect the Macintosh file header, or resource fork, used in the AppleSingle file format. Converting an AppleSingle file to an AppleDouble format file will let UNIX programs read it by separating the resource fork from the data fork.

Apple provides a utility called asdtool to convert AppleSingle format files to AppleDouble format files and vice versa, with the option of translating a carriage return to a linefeed, and handling wide chars like Kanji. This utility is available on:

<ftp.support.apple.com:/pub/mae/utilities/asdtool.tar>

Follow the steps below to use the asdtool utility:

Step 1

Perform the following command to un-tar the utility:

```
tar xovf asdtool.tar
```

Place the appropriate file (asdtool.hp or asdtool.sun) in the /apple/bin directory. (You can place this file anyplace, but /apple/bin/asdtool would be a logical place. Also, you can rename the file to asdtool from asdtool.hp or asdtool.sun.)

Step 2

If you desire, add the man page for asdtool (asdtool.1).

- Solaris:

```
cp ./asdtool.1 /usr/share/man/man1/asdtool.1
catman 1
```

- HP (Hewlett Packard)

```
cp ./asdtool.1 /usr/man/man1/asdtool.1
catman 1
```

Step 3

To convert an AppleSingle format file to an AppleDouble format file, issue the following command:

```
asdtool 'filename'
```

From within UNIX, you will find that there are now two files associated with the original, for example, filename_dbl and %filename_dbl.

NOTE: The original AppleSingle format file will be left unchanged.

Step 4

From a UNIX program, like vi, you can now edit the filename_dbl. (The %filename_dbl file is the resource fork.)

Step 5

To convert an AppleDouble format file to an AppleSingle format file, issue the same command (asdtool 'filename' -- as shown in Step 3). The new file created will be named, filename_sgl.

NOTE: The filename to use for Step 5, should NOT be the AppleDouble file that begins with '%' (percent), because asdtool will improperly create the AppleSingle file from that file.

Step 6

The asdtool can deduce the source file format and convert to the other file format, placing the suffix _sgl or _dbl to distinguish the type.

Step 7

The two options are as follows for asdtool:

-t Specifies translation of carriage returns to linefeeds.

-w Specifies source files use wide characters such as Kanji.

Guest Entry on PowerTalk Keychain (9/95)

Revised: 9/14/95
Security: Everyone

Guest Entry on PowerTalk Keychain (9/95)

Article Created: 14 September 1995

TOPIC -----

I want to receive mail on the computer acting as my PowerShare server, but it does not appear that I can add a PowerShare service to the server's keychain.

DISCUSSION -----

The PowerTalk keychain on a PowerShare server has a Guest entry, for the PowerShare system, that gets created automatically. The Guest entry gets created if the PowerShare Mail Server or the PowerShare Admin application is launched, and there is no pre-existing keychain entry for that PowerShare system.

To successfully add a keychain entry on the computer acting as the server, follow these steps:

Step 1

Make sure that neither the PowerShare Mail Server, nor the PowerShare Admin application launch at startup (check to make sure these applications are not in the Startup Items folder).

Step 2

Open the PowerTalk keychain and remove the Guest PowerShare entry. This will require that you restart of the computer.

Step 3

After the computer restarts, launch the PowerShare Catalog Server application.

Step 4

Open the PowerTalk keychain and add a PowerShare service for the user name which will receive mail on this computer (that is Administrator). Note: This user must

already exist in the PowerShare catalog.

Step 5

Launch the PowerShare Mail Server application.

Step 6

Launch the PowerShare Admin application and verify that the user's Mailbox is on a valid mail server (that is not set to None).

Performa 631CD: RAM Configurations (9/95)

Revised: 9/15/95
Security: Everyone

Performa 631CD: RAM Configurations (9/95)

Article Created: 14 September 1995
Article Review/Updated: 15 September 1995

TOPIC -----

I have some questions about expanding the Random Access Memory (RAM) on my Performa 631CD. How many memory expansion slots are on my computer? What is the maximum amount of RAM that I can install? Do I have to install Single Inline Memory Modules (SIMMs) in pairs of the same size?

DISCUSSION -----

There are two SIMM expansion slots on the Performa 631CD. The computer ships with 4 megabytes (MB) of RAM soldered on the logic board and 4MB of RAM installed in the expansion slot. The maximum amount of RAM that can be installed is 52MB.

The inside SIMM expansion slot can accommodate a single-banked SIMM in 1, 4, or 16MB sizes. The outside slot can accept a double-banked SIMM in 1, 2, 4, 8, 16, or 32 MB sizes. SIMMs do not have to be installed in same size pairs.

PowerShare SMTP Gateway: Launch With -1625 Error (9/95)

Revised: 9/14/95
Security: Everyone

PowerShare SMTP Gateway: Launch With -1625 Error (9/95)

=====

Article Created: 14 September 1995

TOPIC -----

When attempting to launch an SMTP Gateway on a PowerShare server, we encounter an error, -1625. How can this be resolved?

DISCUSSION -----

The AOCE (Apple Open Collaborative Environment) error being reported, -1625 (kOCEStreamCreationErr), indicates the SMTP Gateway was unable to open a communication stream with the Catalog server. To resolve, first make sure the Catalog server is running and processing requests through PowerShare Admin. Restart the Catalog Server if necessary.

If the Catalog server exhibits no problems, check for the existence of a "Guest" entry in the PowerTalk keychain on the computer with the SMTP server. If such an entry exists it would prevent the creation of an "authenticated" communication session with the PowerShare Catalog Server even if it is on the same computer.

The occurrence of a "Guest" entry is not unusual because it gets created if the PowerShare Mail Server or the PowerShare Admin application is launched on a computer with no pre-existing keychain entry for its associated PowerShare system.

The steps to remove "Guest" from the keychain and to prevent its recurrence follow:

Step 1

Make sure that neither the PowerShare Mail Server, nor the PowerShare Admin application launch at startup (check to make sure these applications are not in the Startup Items folder).

Step 2

Open the PowerTalk keychain and remove the "Guest" PowerShare entry. This will require a restart of the computer.

Step 3

After the computer restarts, launch the PowerShare Catalog Server application.

Step 4

Open the PowerTalk keychain and add a PowerShare service for a valid user name (that is "Administrator"). Note: This user must already exist in the PowerShare catalog.

If a valid user entry exists in the PowerTalk keychain and the -1625 error still occurs, there is a problem with the PowerShare permissions for that user. In such a case either that user would need to be granted wider permissions or the keychain entry would need to be replaced with a user already possessing wider permissions.

DOS Compatibility Card: Problem W/ Reflections for Windows 9/95

Revised: 9/14/95
Security: Everyone

DOS Compatibility Card: Problem W/ Reflections for Windows 9/95

Article Created: 14 September 1995

TOPIC-----

I am using Reflections with a DOS Compatibility Card, and sometimes when I click outside the Reflections window the pointer begins to jump around the screen and randomly click. What can I do to correct this problem?

DISCUSSION-----

After some discussion with Walker Richer & Quinn, Inc. who produces the software, the following situations were discovered.

Reflections 4.21, DOS Compatibility Software 1.0.3 and Windows 3.11:

The mouse begins to jump around and click. The only way to resolve the problem is to use keyboard equivalents to save work and exit Windows. When Windows is restarted, the mouse returns to normal.

Reflections 4.21, DOS Compatibility Software 1.0.7 and Windows 3.11:

Same as above.

Reflections 5.0, DOS Compatibility Software 1.0.7 and Windows 3.11:

The mouse begins to jump around and click, but returns to normal if left alone for a few seconds.

Reflections 5.0, DOS Compatibility Software 1.0.7 and Windows 95:

No problems.

Based on these findings, you should upgrade to at least DOS Compatibility Software version 1.0.7 and Reflections for Windows 5.0. Upgrading to Windows 95 is also recommended.

Pwr Mac DOS Compat Card: CONFIG.SYS & AUTOEXEC.BAT Files

Revised: 5/23/96
Security: Everyone

Pwr Mac DOS Compat Card: CONFIG.SYS & AUTOEXEC.BAT Files (6/96)

Article Created: 14 September 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

This document lists the contents of CONFIG.SYS and AUTOEXEC.BAT for the Power Macintosh 6100 DOS Compatible (and DOS Compatibility Card for the Power Macintosh) as they appear from the factory.

DISCUSSION -----

If you have lost or changed your CONFIG.SYS or AUTOEXEC.BAT files and want to restore them to their original conditions, edit them to match the following information.

NOTE:

You can also mount your MS-DOS/Windows container and open these files from within the MacOS. However the application you use to edit these files must be able to save hard carriage returns as carriage return and line feed. The MacOS normally uses ONLY carriage returns, but MS-DOS requires both carriage returns and line feeds.

CONFIG.SYS

```
DEVICE=C:\DOS\SETVER.EXE
DEVICE=C:\DOS\HIMEM.SYS /TESTMEM:OFF
```

```
REM If you are using PC Setup 1.0.7, the lines are:

Quadra 610 DOS: CONFIG.SYS & AUTOEXEC.BAT Files (6/96)

Article Created: 14 September 1995
Article Reviewed/Updated: 4 June 1996

TOPIC -----

This document lists the contents of CONFIG.SYS and AUTOEXEC.BAT for the Quadra 610 DOS Compatible computer (and DOS Compatibility Card for Centris and Quadra 610) as they appear from the factory. As of 4 June 1996, the only version of PC Setup Apple Computer, Inc. fully supports with the Macintosh Quadra 610 DOS Compatibility Card is version 1.0.2. Later versions of this software may work properly, however Apple has not fully tested them with the Quadra 610 DOS Compatibility Card.

DISCUSSION -----

If you have lost or changed your CONFIG.SYS or AUTOEXEC.BAT files and want to restore them to their original conditions, edit them to match the following information.

NOTE:

You can also mount your MS-DOS/Windows container and open these files from within the Mac OS. However the application you use to edit these files must be able to save hard carriage returns as carriage return and line feed. The Mac OS normally uses ONLY carriage returns, but MS-DOS requires both carriage returns and line feeds.

Apple Printers: LaserWriter Support Under Windows 95 (12/95)

Revised: 12/5/95
Security: Everyone

Apple Printers: LaserWriter Support Under Windows 95 (12/95)

Article Created: 14 September 1995
Article Reviewed/Updated: 5 December 1995

TOPIC -----

What Apple LaserWriters are supported under Microsoft Windows 95?

DISCUSSION -----

Microsoft Windows 95 ships with PostScript PPD files for most Apple LaserWriters including:

Apple LaserWriter
Apple LaserWriter Personal NT
Apple LaserWriter II NTX
Apple LaserWriter IIx
Apple LaserWriter IIfx
Apple LaserWriter IIg
Apple LaserWriter Plus
Apple LaserWriter Pro 600
Apple LaserWriter Pro 630
Apple LaserWriter Pro 810
Apple LaserWriter Select 360
Apple Personal LaserWriter NTR

These PPD files were created and are supported by Microsoft.

Apple has released, to online services, Windows 95 PPD files for the following LaserWriter printers:

Color LaserWriter 12/600 PS
LaserWriter 16/600 PS

Apple has not created a PPD for the LaserWriter Select 310. However, other PPD files could easily be substituted.

These articles can help you locate the PPD software for the Color LaserWriter 12/600 PS and LaserWriter 16/600 PS mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

05 Dec 1995 - Included Apple released PPD files and where to get them.

25 Sep 1995 - Added information on Microsoft support.

Power Macintosh 5200/5300:Multimedia Learning Tools Bundle(9/95)

Revised: 5/7/96
Security: Everyone

Power Macintosh 5200/5300:Multimedia Learning Tools Bundle(9/95)

=====

Article Created: 14 September 1995

TOPIC -----

This article describes the Multimedia Learning Tools Bundle for the Apple Education Series. The Apple Education Series (AES) is a series of products specifically intended for the effective use of technology in education. This bundle is only available in the Apple Education market, not in any other reseller channels.

DISCUSSION -----

Overview

=====

The Apple Education Series (AES) Multimedia Learning Tools bundle is the latest in the AES series for K12 institutions. Multimedia Learning Tools is intended to enable students and teachers to easily create multimedia projects using text, video, pictures, animation, and sounds. Bundled software includes authoring tools, design tools, and content ready for students and teachers to paste right into their projects.

Features

=====

High quality software

Saves time in reviewing software for purchase because Apple reviewed the products for you.

Multimedia resources

Includes a variety of text, photographs, clip art, movies, backgrounds, charts, graphs, music, sound effects, and historical information which students can paste into their projects.

Multimedia projects

Developed by teachers, these projects walk teachers and students through the creation of exciting multimedia projects while focusing on interdisciplinary and collaborative learning techniques.

Textbooks

Provide step-by-step instructions for beginning authoring, and information on what teachers are doing with multimedia.

Bundled Items

=====
The following software is bundled with the AES Multimedia Learning Tools bundle in the accessory kit:

Apple Software

Apple Multimedia Learning Tools Master CD includes the following Apple software:

- Apple Font Pack**
- Hypercard 2.3.3 w/ AddMotion & Multimedia Utilities (Intellimation version)**
- Virtus VR with Archaeology Scenes
- ColorIt!
- RAM Doubler
- QuickTime Extras (Musical Instruments and Movie Player)**

Third Party Software (on CD unless noted otherwise)

-
- HyperStudio CD (3.0.62f w/ the HyperStudio Media Library) by Roger Wagner Publishing, Inc.
 - Kid Pix Studio CD (1.0.1) by Broderbund Software, Inc.
 - Avid Videoshop CD (3.01) by Avid Technology, Inc.
 - ClarisImpact CD (1.0 v4) by Claris Corporation
 - ColorIt! by MicroFrontier**
 - Virtus VR with Archaeology Scenes by Virtus Corporation**
 - Microsoft Bookshelf CD (1.0) by Microsoft Corporation
 - Time Almanac 1995 CD (1.0) by Compact Publishing, Inc.
 - MacGallery CD (1.1) by DreamMaker Software
 - Famous Faces CD (6-18-93) by Jasmine Multimedia Publishing
 - MediaClips 1 CD (1.0): Animals/Rainforest/Deep Voyage by SoftKey Multimedia Inc.
 - MediaClips 2 CD (1.0): American View/Space Odyssey/World View by SoftKey Multimedia Inc.
 - MultiWare Multi-Media Collection by BeachWare
 - RAM Doubler by Connectix**

**NOTE: These items are included on the Apple Multimedia Learning Tools Master CD.

Other Bundled Items

=====

Manuals

- Teacher's Manual, includes: Product Overview, Introduction to Multimedia, 12 Multimedia Projects
- Avid VideoShop user manual
- Kid Pix Studio user manual
- Virtus VR. user manual
- HyperStudio manual
- HyperCard Reference Guide
- ClarisImpact Reference Guide

Textbooks

- Multimedia Flying Solo by Thomson Learning
- Multimedia and Learning by National School Board Assoc.

Other

- Kodak Single-Use Camera and Photo CD Mailer
- Multimedia Learning Tools Poster

Usage Requirements

=====

The Multimedia Learning Tools bundle includes the required hardware and software to successfully use the bundle. It is only supported on the Power Macintosh 5200 and 5300 systems with which it ships.

Configurations

=====

The bundle is available with either of the two following Power Macintosh systems:

- Power Macintosh 5200/75 LC CD 8 MB RAM, 500 MB hard drive*
- Power Macintosh 5300/100 LC CD AV 16 MB RAM, 1 GB hard drive*

* For technical information about the Power Macintosh 5200 computer, use the search string: power macintosh 5200 and specifications to find the article "Power Macintosh 5200/75 LC: Technical Specifications". Use the search string: power macintosh 5300 and specifications to find the article "Power Macintosh 5300/100 LC: Technical Specifications".

Apple Computer, Inc.Trademark/Service mark List 2 of 2 (10/96)

Revised: 10/17/96
Security: Everyone

Apple Computer, Inc.Trademark/Service mark List 2 of 2 (10/96)

=====

Apple Computer, Inc.Trademark List Part 2 October, 1996

The following is a current list of Apple's trademarks and service marks, as well as trademarks licensed by Apple from third parties.

When using the marks in publications that will be distributed only in the United States, include the appropriate (TM), SM, or (R) symbol on first use. For publications that will be distributed outside the United States, do not include trademark symbols.

The list also includes one or more suggested generic terms for each trademark. For all publications, include an appropriate generic term with the trademark the first time it appears. Thereafter, the generic term should appear frequently with the trademark. (Note: These generic terms are only suggestions, and there may be other words that are equally appropriate.)

Remember that trademarks are adjectives, and cannot be made plural or possessive.

All publications must include a copyright statement and credit lines listing the Apple and licensed third-party trademarks mentioned in the publication. The document "Using Apple Trademarks/Employee" (see below) explains how to compose the copyright statement and credit lines.

For more information on how to use Apple's trademarks, please refer to the Trademark and Copyright Information area on AppleWeb (<http://web.apple.com/Areas/TrademarkInformation>). Download the documents "Trademark Copy Review Instructions" and "Using Apple Trademarks/Employee." The current Apple Trademark List is also posted there. If you don't have access to AppleWeb, contact the Trademark Department at (408) 974-6638.

The absence of a product or service name or logo from this list does not constitute a waiver of Apple's trademark or other intellectual property rights concerning that name or logo.

SPECIAL AND LICENSED TRADEMARKS AND/OR COPYRIGHTS

=====

Use the trademark notation shown here the first time the trademark is mentioned in text in U.S. publications. Include the credit line in all publications (U.S. and international) in which the trademark is mentioned; do not include the trademark symbols in the credit lines. In addition to the marks listed below, all Claris marks require trademark symbols and credit lines. Refer to the Claris Trademark List, which is included in the Trademark Folder on AppleLink.

ACT! for Newton: ACT! is used under license from Symantec Corporation.

ADDmotion(TM) is a trademark of Motion Works International, Inc.

Ad Lib(TM) is a trademark of Nick Nallick, used under license.

Adobe(TM), the Adobe logo(TM), Acrobat(TM), the Acrobat logo(TM), Distiller(TM), PostScript(TM), and the PostScript logo(TM) are trademarks of Adobe Systems Incorporated or its subsidiaries and may be registered in certain jurisdictions. (Adobe prefers that this form of the credit line be used for all its trademarks, but only the trademarks listed here need to have the TM symbol in text.)

AIX(TM) is a trademark of IBM Corp., registered in the U.S. and other countries, and is being used under license.

AppleWorks(R) is a registered trademark of Apple Computer, Inc. licensed to Claris Corporation.

Berlitz(R) and the Berlitz Logo are registered trademarks of Berlitz International, Inc.

CDB(TM) is a trademark of Third Eye Software, Inc.

The CD Extra(TM) logo is a trademark of Sony Corporation.

Classic(R) is a registered trademark licensed to Apple Computer, Inc.

DEC(TM), DECnet(TM), VMS(TM), and VAX(TM) are trademarks of Digital Equipment Corporation.

Earth Explorer(TM), the Earth Explorer logo(TM), Enteractive(TM), and the Enteractive logo(TM) are trademarks of Enteractive, Inc. All packaging and labels must also include the following copyright notice: Software (c) 1995 Enteractive, Inc. All rights reserved.

FaceSpan(TM) and FrontMost(TM) are trademarks of Software Designs Unlimited, Inc.

Helvetica(R), Times(R), and Palatino(R) are registered trademarks of Linotype-Hell AG and/or its subsidiaries.

ITC Avant Garde Gothic(R), ITC Bookman(R), ITC Garamond(R), ITC Zapf Chancery(R), and ITC Zapf Dingbats(R) are registered trademarks of International Typeface Corporation.

Java(TM) is a trademark of Sun Microsystems, Inc. (Place the (TM) notation after the first mention of Java in text.)

LaserTools(TM) is a trademark of LaserTools Corporation.

MacDNS (use the following copyright notice only on end-user documentation):
ThreadLib 1.04 (c) 1994 by Ari Halberstadt.

MobileComm(R) is a registered trademark of Mobile Communications Corporation of America.

Netscape Navigator(TM) is a trademark of Netscape Communications Corporation.

Notion(TM) is a trademark of Eidetic, Inc. All packaging and product labels must also include the following copyright notice: (c)1994, Eidetic, Inc. All rights reserved.

NuBus is a trademark of Texas Instruments.

"Pantone(R) is a registered trademark of Pantone, Inc.", "The Pantone Design(TM) is a trademark of Pantone, Inc.", or "Pantone(R) and the Pantone Calibrated Design(TM) are trademarks of Pantone, Inc."

Peter's Alphabet Adventure(R), Peter's Magic Adventure(R), and Peter's Numbers Adventure(R) are registered trademarks of Arborescence SA.

The Photo CD logo(TM) is a trademark of Eastman Kodak Company.

PowerCD(TM) is a trademark of ZCI, Inc., Dallas, Texas.

PowerForms(TM) is a trademark of Sestra, Inc., a division of HealthCare Communications.

PowerPC(TM) and the PowerPC logo(TM) are trademarks of International Business Machines Corporation, used under license therefrom.

RealAudio(TM) and the RealAudio logo(TM) are trademarks of Progressive Networks, Inc.

Ryumin Light KL(TM) and Gothic Medium BBB(TM) are trademarks of Morisawa & Co. Ltd.

SRS(R) - Use one of the following as appropriate: "The SRS Symbol - (*) - is a registered trademark of SRS Labs, Inc." or "The word SRS is a registered trademark of SRS Labs,. Inc.", or SRS and the SRS Symbol - (*) - are registered trademarks of SRS Labs, Inc."

Smalltalk-80(TM) is a trademark of ParcPlace Systems.

SoftWindows(TM): Windows is a registered trademark of Microsoft Corporation and SoftWindows is a trademark used under license by Insignia from Microsoft Corporation. (Place a (TM) symbol after the first and most prominent use of the mark SoftWindows in text.)

TextBridge(R) and Xerox(R) are registered trademarks of Xerox Corporation.

Traveling Software(TM) is a trademark of Traveling Software, Inc.

Trinitron(R) is a trademark of Sony Corporation, registered in the U.S. and other countries.

UNIX(R) is a registered trademark in the United States and other countries, licensed exclusively through X/Open Company, Ltd.

VideoWorks(TM) is a trademark of Macromedia, Inc.

WiggleWorks(TM) is a trademark of Scholastic, Inc.

XJACK(TM) is a trademark of Megahertz Corporation, U.S. Patent No. 5,183,404.

X Window System(TM) is a trademark of the Massachusetts Institute of Technology.

OTHER APPLE PRODUCT OR SERVICE NAMES

=====

If a product or service name is not listed under Apple's Trademarks or Apple's Service Marks, it should not be followed by a (TM) or (R) notation and should not be included in credit lines. However, if a name includes Apple, Macintosh, or another Apple mark listed in this document, do apply the correct trademark symbol ((TM) or (R)) to that portion of the name and note that portion in credit lines. In addition, capitalize the first letter of each word of the product name.

Examples:

Apple(R) Multiple Scan 20 Display--credit line: Apple is a registered trademark of Apple Computer, Inc.

Color StyleWriter(R)--credit line: StyleWriter is a registered trademark of Apple Computer, Inc.

QuickDraw(TM) GX--credit line: QuickDraw is a trademark of Apple Computer, Inc.

Macintosh(R) PowerBook(R) Active-Matrix Display Upgrade--credit line: Macintosh and PowerBook are registered trademarks of Apple Computer, Inc.

SPECIAL COMMENTS

=====

If you have any questions regarding the list, please contact TJ Angioletti in the Trademark Department (408/974-6638). We would appreciate a call if you are aware of any changes, deletions, or additions needed to update the list.

This list includes updates as of September 30, 1996.

Power Macintosh 9500: CD 2.0 Contents (4/97)

Revised: 4/29/97
Security: Everyone

Power Macintosh 9500: CD 2.0 Contents (4/97)

Article Created: 14 September 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

From August 8 to November 15, 1995, customers who purchased either a Power Macintosh 9500/120 or a 9500/132 and received CD Version 1.0 are eligible to contact the Apple Order Center to order the most recent version of the Power Macintosh 9500 CD—CD Version 2.0.

DISCUSSION -----

The new CD offers over two dozen new and updated files (see chart, below) and provides fixes to some known problems. Among other things, the CD provides owners of the Power Macintosh 9500 with software they can use with the GeoPort Telecom Adapter: Apple Telecom 2.1 and Megaphone 1.0.2. It also provides drivers for the LaserWriter 300 and StyleWriter1200. Of particular interest to customers on networks, the new CD provides Open Transport (OT) 1.0.6, a new version of Open Transport that will fix a number of problems reported with OT 1.0, the version that shipped on the original CD.

The following chart offers a comparison between the software included on the CD initially distributed with the Power Macintosh 9500 and the CD available at the Apple Order Center:

Begin_Table

COMPONENT -----	CD 1.0 -----	CD 2.0 -----	COMMENTS -----
System software components			
Finder	7.5.2	7.5.3	New version.
System Enabler 701	1.0	1.1	New version offers improved PCI card compatibility.
AppleCD Audio Player	2.0	2.1	New version.
Apple Menu Options	1.0.1	1.0.2	New version.

Extensions Manager	3.0	3.0.2	New version.
Memory	7.5.3	7.5.4	New version.
Monitors	7.5.2	7.5.3	New version.
Mouse	7.3	7.3.1	New version.
PC Exchange	2.0.4	2.0.5	New version.
EM Extension	3.0	3.0.2	New version.
Open Transport	1.0	1.0.6	New version offers improved stability & compatibility.
Apple CD-ROM	5.0.4	5.1.1	New version.
Apple Guide	1.2.5	1.2.7	New version.
9500 Guide Additions	n/a	1.0	Replaces 9500 Guide Additions on 9500.
EtherNet (Built-In)	1.0	1.0.1	New version.
Serial (Built-In)	1.0	1.0.2	New version.
StyleWriter I/II	2.0	n/a	SW 1200 2.1 supports SWI/II
Color SW 2400	1.6.1	2.1	New version.
LaserWriter 300	n/a	1.2	Added to 9500.
StyleWriter 1200	n/a	2.1	Added to 9500.
Extras, utilities, read me			
PM9500 ReadMe	n/a	new	Replaces 9500 ReadMe on 9500.
Drive Setup	1.0	1.0.2	New version.
Apple Telecom 2.1	n/a	2.1	Added to 9500.
Megaphone	n/a	1.0.2	Added to 9500.
Unique to PM9500			
Graphics Accelerator	1.0	1.0	For ATI card shipping with 9500/120.

End_Table

Customers will receive the following items with their order:

- Power Macintosh CD v2.0
- Software License Agreement

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Article Change History:

QuickDraw GX 1.1.3: ReadMe File (4/97)

Article Created: 14 September 1995
Article Reveiwed/Updated: 29 April 1997

TOPIC -----

This article contains the Read Me file included with QuickDraw GX 1.1.3 posted to online services.

DISCUSSION -----

QuickDraw GX 1.1.3--Read Me

What Changed in QuickDraw GX 1.1.3

QuickDraw GX 1.1.3 fixes several problems found since the release of the previous version.

Color StyleWriter Pro GX

This version of QuickDraw GX is fully compatible with the Color StyleWriter Pro GX driver. This driver is available separately on on-line services and Apple Computer's FTP and World Wide Web sites.

CompuServe: GO APLSUP
America OnLine: keyword ftp, then connect to ftp.info.apple.com
FTP: ftp.info.apple.com
Web: http://www.info.apple.com

Moving Desktop Printers

Desktop printers now stay in the correct location after rebooting.

Adobe Type Manager 3.8.3

ATM 3.8.3 is included with QuickDraw GX 1.1.3. This new version is fully

compatible with OpenDoc.

What Changed in QuickDraw GX 1.1.2

=====

Installation Over Previous Versions

There is no longer a need to delete the Finder Preferences file when installing over a previous version of QuickDraw GX.

Finder Out of Memory Alerts

Some users were encountering multiple Finder out of memory alerts while printing with QuickDraw GX 1.1.1. This problem is fixed in QuickDraw GX 1.1.2.

Crash When Canceling Printing From Power Macintoshes to Networked PostScript Printers

Some users were encountering problems when canceling a print job to a networked PostScript printer. This problem is fixed in QuickDraw GX 1.1.2.

Unable to Print to Tektronix and Hewlett-Packard PostScript Printers

Some users were unable to print to Tektronix and Hewlett-Packard PostScript printers with QuickDraw GX 1.1.1. This problem is fixed in QuickDraw GX 1.1.2.

What Changed in QuickDraw GX 1.1.1

=====

QuickDraw GX 1.1.1 provided performance improvements, a user interface change, and new features.

Performance Improvements

- no "lock out" when downloading fonts to PostScript printers
- font downloading progress shows in the desktop printer window
- prints large character sets, such as Japanese, on printers that do not have these fonts built in
- prints large character sets faster than GX 1.0.2 or the non-GX LaserWriter 8.2 printer driver
- printing dialogs for non-QuickDraw GX applications display more quickly

User Interface Change

When a desktop printer queue is empty (i.e., after the last job has printed) the page icon goes away rather than turning into the dog-eared page icon.

New Features

- Manual Feed Alerts

To turn off the alerts for manual feed printing on PostScript printers, open the Printing menu and choose Disable Manual Feed Alerts.

- LaserWriter GX Features

In the PostScript printing dialog box for non-QuickDraw GX applications, two new menus allow you to choose paper types. Use the "First Page On" menu to choose a paper type for the first page. Use the "Remaining Pages On" menu to choose a paper type for the rest of the document.

- N-Up Printing Options

The N-Up Printing extension (in your Extensions folder) lets you print up to 16 pages on a single sheet of paper. You can also put an optional border around each page drawn on a sheet.

- To set pages-per-sheet and border defaults for a desktop printer, click the printer icon to select it then choose N-Up Printing Options from the Printing menu.

- To select pages-per-sheet and border options when you print a document created in a QuickDraw GX-aware application, click the N-Up printing extension icon in the Print dialog box.

- To select pages-per-sheet and border options for a document created in an application that does not support QuickDraw GX, choose Page Setup in the File menu.

- PostScript File Options

EPSExtension (in your Extensions folder) lets you configure the PostScript file that is created whenever you print using the LaserWriter GX printer driver.

- You can use the saved file as Encapsulated PostScript for importing graphics into applications that do not support QuickDraw GX, such as Aldus PageMaker, QuarkXPress, and Adobe Illustrator.

- To set EPS options, choose PostScript File Options from the Printing menu.

- EPSExtension is not installed by Easy Install. To get it, you must open the QuickDraw GX Installer and choose Custom Install from pop-up menu. Click the arrow next to QuickDraw GX Utilities to see the list of utilities, and click the checkbox next to EPSExtension to select it. Then click the Install button.

- Paper Types

QuickDraw GX 1.1.1 include 3 new paper types for use in configuring the paper tray selections for desktop printers: Letterhead, Stationery, and 3-Hole Punch.

- The new paper types are installed by Easy Install For more information on editing the new papers types or creating your own paper type, you must install the PaperType Editor.

- The PaperType Editor is not installed by Easy Install. To install it, open the QuickDraw GX Installer and choose Custom Install from pop-up menu. Click the arrow next to QuickDraw GX Utilities to see the list of utilities, and click the checkbox next to PaperType Editor to select it. Then click the Install button.

Tips

====

Envelope Paper Types and the LaserWriter GX Driver

The LaserWriter GX printer driver handles three types of No. 10 envelopes. However, each of the three types is designed for a different type of LaserWriter printer. Your choice of envelope should be based on how your printer feeds envelopes from the paper input tray:

- "Envelope - Center Fed" is for printers that feed the envelope in the center of the paper input tray.
- "Envelope - Edge Fed" is for printers that feed the envelope on the left edge of the paper input tray.
- "No. 10 Envelope" is for certain new printers (e.g., the LaserWriter 16/1600PS) that use a different method of determining paper size.

Restoring Type 1 Fonts to Their Original State

If you remove QuickDraw GX from your system, you need to restore your Type 1 fonts. To restore Type 1 fonts, follow these steps:

1. Open the System Folder.
2. Open the Fonts folder.
3. Drag any suitcases that have been enabled to the Trash.
4. Open the •Archived Type 1 Fonts• folder.
5. Move the contents of the •Archived Type 1 Fonts• folder to the Fonts folder.
6. Drag the •Archived Type 1 Fonts• folder to the Trash.

Tekton Plus RegularSC Prints as Courier From Some Applications

In application programs which do not take advantage of QuickDraw GX, Tekton Plus appears as two fonts: Tekton Plus Regular and Tekton Plus RegularSC. Applications such as Adobe Illustrator, QuarkXPress, and Aldus PageMaker print characters from Tekton Plus RegularSC as Courier on PostScript printers.

Troubleshooting

=====

QuickDraw GX and Memory

- On a Macintosh with 8 MB of available memory with Macintosh system software version 7.5, QuickDraw GX, and PowerTalk, you can enable only a limited number of printing extensions and desktop printers. More than 7 of each at the same time may cause a low-memory alert to appear. If you want to have more than 7 desktop printers, removing a printing extension will help alleviate memory difficulties and vice-versa. If a low-memory alert does appear, try deactivating printing extensions or removing desktop printers. For more information about desktop printers and printing extensions, see the Macintosh System 7.5 Upgrade Guide.

QuickDraw GX and Application Programs

- If possible, do not use the QuickDraw GX Helper (to turn off desktop printing) with WordPerfect versions 3.0 and earlier. In WordPerfect, when you turn desktop printing off, the third item on the Apple Menu (which corresponds to the first alphabetic item in the Apple Items folder) opens. WordPerfect versions 3.1 and later are compatible with QuickDraw GX.

- In PageMaker version 5.0, documents containing PICTs will print without the PICTs and an extra blank page may be printed at the end of some documents. To print correctly, hold down the Option key when you choose Print from the File menu.

- To print on a PostScript printer using Insignia Solutions' SoftPC and SoftWindows versions earlier than 1.0.2a, you must turn off desktop printing or use the Epson LQ-2500 output option. To turn off desktop printing, use the QuickDraw GX Helper (one of the QuickDraw GX Utilities). To install the QuickDraw GX Utilities, see the instructions in Chapter 3 ("Installing QuickDraw GX") of the Macintosh System 7.5 Upgrade Guide. SoftWindows versions 1.0.2a and later are compatible with QuickDraw GX.

- Adobe Acrobat Reader versions earlier than 2.0.1 and all versions of Adobe Acrobat Exchange are incompatible with QuickDraw GX 1.1.3. Please contact Adobe Systems for upgrade information.

- The substitution fonts included with Adobe Illustrator 5.5 and SuperATM are not compatible with QuickDraw GX 1.1.3. If you install QuickDraw GX 1.1.3 on a Macintosh where these substitution fonts have already been installed, you will see a dialog box which says "The substitution fonts necessary for Acrobat and SuperATM are missing. Please re-install either software package." QuickDraw GX-compatible versions of these fonts are available as part of the Adobe Acrobat Reader 2.0.1 package. Please contact Adobe Systems for more information.

- You should print documents that use the Al-Nashir Al-Sahafi font (Arabic Design Studio) on raster (non-PostScript) printers. If you try to print an Al-Nashir Al-Sahafi document on a PostScript printers, no document will print.

Installing QuickDraw GX with the Power Macintosh Upgrade Card

When you install QuickDraw GX on a Macintosh with the Power Macintosh Upgrade Card, make sure that the upgrade card is enabled before installing QuickDraw GX.

Manual Feed and the LaserWriter IISC GX driver

When you print a manual feed job to a printer using the LaserWriter IISC GX driver, wait for the manual feed alert to appear before inserting the next page. If you insert the page before the alert appears, your printer will print the first page twice and then stop printing. Opening and closing the cover on your printer will clear it.

QuickDraw GX with the Vector Imaging System on the Power Macintosh

There is a problem with the Vector Imaging System and Power Macintosh. If you

have problems plotting, turn off Modern Memory in the Memory control panel.

Color StyleWriter Pro: GX Driver ReadMe File (9/95)

Revised: 9/14/95
Security: Everyone

Color StyleWriter Pro: GX Driver ReadMe File (9/95)

=====

Article Created: 14 September 1995

TOPIC -----

This article contains the Read Me file included with the QuickDraw GX software upgrade for the Color StyleWriter Pro printer available from online services.

DISCUSSION -----

QuickDraw GX Upgrade
for the Color StyleWriter Pro printer

This upgrade gives you the ability to use the Color StyleWriter Pro printer with QuickDraw GX.

The instructions in this document tell you how to install and use the software.

Installation

=====

IMPORTANT: To use this upgrade with your Color StyleWriter Pro printer you must have QuickDraw GX software version 1.1.3 or later installed on your system. QuickDraw GX version software is also available online.

This upgrade includes two system files:

- Color SW Pro GX
- Apple Color SW Pro CMM

Step 1

Drag these two files to the Extensions folder inside your System Folder.

Step 2

Restart your computer.

Step 3

Select the Chooser from the Apple (🍏) menu.

Step 4

Click the Color SW Pro GX icon in the Chooser.

Step 5

Make choices in the Chooser, depending on whether the printer is connected directly to your computer:

- If the printer is connected directly to your computer, choose Serial from the "Connect via" pop-up menu, then click the Modem Port or Printer Port icon to indicate which port the printer cable is plugged into.
- If the printer is connected to another computer as a shared printer, choose Servers from the "Connect via" pop-up menu. If your network has zones, click the AppleTalk zone containing the printer and then click the name of the printer you want to use.

Step 6

Click the Create button. A printer icon appears on your desktop.

Step 7

Close the Chooser by clicking its close box. If you close the Chooser without creating at least one desktop printer, a message appears. If you select a printer but don't click Create, the Chooser ignores the selection.

Using the Color StyleWriter Pro with QuickDraw GX

=====

For the most part you use the QuickDraw GX Color StyleWriter Pro software just as you would the current non-GX version of the software. You have all the same options plus a few extras. When you use GX-savvy programs, the appearance of the Print and Page Setup dialog boxes changes, as described below.

Page Setup dialog box. The Page Setup dialog box comes in a basic version and an expanded version. Though it has a different appearance in GX-savvy programs, all the settings in the old Page Setup dialog box are also in the GX-savvy Page Setup dialog box, and it works the same way.

Print dialog box. GX-savvy programs have a Print dialog box with a very different look. The Print dialog box comes in a basic version and an expanded version. You can switch between them by clicking the More Choices and Fewer Choices buttons. The expanded version is broken up into panels, each of which controls a different set of print functions. You can switch between panels by clicking the icons on the left side of the expanded dialog box.

Where to find familiar Color StyleWriter Pro features

=====

Most features in the Print dialog box from your current Color StyleWriter Pro software are also present in the GX-savvy versions of that dialog box, though they might not be in the same places. Here's where to find them:

- Most of the settings from the old Print dialog box are in the General panel of the expanded GX-savvy Print dialog box. The Paper Type and Image options are in the Quality panel.
- Most of the options from the old Color Options dialog box are in the Quality panel of the expanded GX-savvy Print dialog box.
- All the options in the old Utilities dialog box are in the Utilities panel of the expanded GX-savvy Print dialog box.

New features

You can use the panels of this upgrade to take advantage of standard QuickDraw GX features with the Color StyleWriter Pro.

- You can use desktop printer icons to monitor and manipulate your print requests and to print a document from the Finder.
- You can print a number of minipages on each sheet of paper. Use the N-up panel of the expanded Print dialog box.
- You can schedule when documents should print. Use the Print panel of the expanded Print dialog box.

Turning off QuickDraw GX for programs that aren't GX-savvy

If you experience incompatibilities while using the QuickDraw GX software with a specific program that isn't GX-savvy, you can temporarily print with GX off. In order to do that you need two things:

- The file QuickDraw GX Helper:
This can be installed using the QuickDraw GX installer. Select Custom Install, then select QuickDraw GX Utilities and then select QuickDraw GX Helper.
- The software from the Color SW Pro disk set.
Select Easy Install in the Color SW Pro installer

Once both the QuickDraw GX Helper and the Color SW Pro SW are installed, follow these steps to turn QuickDraw GX off temporarily:

Step 1

Open the non-GX-savvy program that's giving you problems.

Step 2

Choose Turn Desktop Printing Off from the Apple (🍏) menu. A message appears asking if it's OK to use the "Color SW Pro" software. Click OK. (If the message doesn't mention the Color SW Pro , you may need to reinstall your printer software from the disks that came with your printer.)

Step 3

Click OK. Now your Color StyleWriter Pro will use the regular QuickDraw printing software for this program. If you want to go back to using the QuickDraw GX printing software, repeat this process, but in step 2 choose Turn Desktop Printing On.

Power Mac 7200, 7500, 8500, 9500: Reset/Interrupt Switch (9/95)

Revised: 9/15/95
Security: Everyone

Power Mac 7200, 7500, 8500, 9500: Reset/Interrupt Switch (9/95)

=====

Article Created: 15 September 1995

TOPIC -----

My Power Macintosh 7200 has locked up (the screen is frozen), and it appears that the only way to reset the computer is to disconnect the power cable from the back of the computer. Do I have any alternatives?

DISCUSSION -----

There are several methods for interrupting or resetting your computer.

Interrupting your computer
=====

Interrupts are used by Macintosh software programmers when writing applications and debugging them. An interrupt produces a blank dialog box on the Macintosh screen. Programmers can then type codes to obtain the response or information they require from the Macintosh.

You can interrupt your computer by pressing the keyboard shortcut Command-Power.

Resetting your computer
=====

Resetting the computer is the same as disconnecting and reconnecting the power from the back of the computer.

You can reset your computer in one of two ways:

Keyboard shortcut

Pressing the keyboard shortcut Command-Control-Power restarts your computer.

Power button

Pressing the Power button on the front panel of your computer shuts your computer down.

If you press the Power button during startup, before all the extensions and the Finder load, your computer will shut down immediately. If you press the Power button after the desktop appears, the computer shuts down by first closing any open applications and then performing a shutdown. This is the same as choosing "Shutdown" from the Special menu.

When these steps do not work

=====

If these steps fail, it may be necessary to disconnect the power from your Macintosh. You can turn off the power to your computer at your surge suppressor, power strip, or by removing the power cable from the back of your computer or at the outlet.

Power Macintosh: PowerPC 604 Rendering Performance (9/95)

Revised: 9/15/95
Security: Everyone

Power Macintosh: PowerPC 604 Rendering Performance (9/95)

Article Created: 15 September 1995

TOPIC -----

I hear that some high end rendering applications run slowly on the new PowerPC 604-based Power Macintosh computers. Is this a bug?

DISCUSSION -----

No. The PowerPC 604 RISC microprocessor and the new Power Macintosh computers with the Peripheral Component Interconnect (PCI) bus are, on the whole, significantly faster than the PowerPC 601 and original Power Macintosh computers. However, some types of operations – intensive rendering is an example – stress memory access times rather than microprocessor or bus speed.

The memory speed the new Power Macintosh computers is roughly the same as the original Power Macintosh computers. The decision to use similar speed memory was made to ensure easy access to DRAM components. The use of DIMMs and interleaving allows the new memory architecture to be roughly 20-30% faster than the original Power Macintosh computers. In rendering applications that saturate the memory bandwidth, you see a performance increase roughly equivalent to the increase in memory speed. At bottom, even though the PowerPC 604 can render up to two times faster than a PowerPC 601, memory speed poses a bottleneck.

The new Power Macintosh computers based on the PowerPC 604 RISC microprocessor and PCI bus are significantly faster than the original Power Macintosh computers when performing most tasks. When performing other tasks in rendering applications, such as modeling, screen redraw, and animation playback, the Power Macintosh 8500 and 9500 can be as much as two times faster than the Power Macintosh 8100.

PowerBook 200 Series: No Power On From External Keyboard (9/95)

Revised: 9/15/95
Security: Everyone

PowerBook 200 Series: No Power On From External Keyboard (9/95)

=====

Article Created: 15 September 1995

TOPIC -----

When inserted in a Duo Dock, my PowerBook Duo 270c does not turn on from the Power key on an external keyboard. I have tried several Duo Dock docking devices and keyboards. The PowerBook turns on from the Power button in the back of the Duo Dock and from the Power On key on the PowerBook itself when out of the Duo Dock. What is causing this?

DISCUSSION -----

An improperly seated Random Access Memory (RAM) or modem card can cause a key on the PowerBook 200 series keyboard to touch the display housing when the PowerBook is in the Duo Dock. This prevents the PowerBook from turning on from an external keyboard.

To test for this condition, use the following procedure:

Step 1

Remove any equipment from the top of the Duo Dock and remove the Duo Dock cover.

Step 2

Insert the PowerBook into the Duo Dock. Verify that the external monitor cable is attached.

Step 3

Open the PowerBook display.

Step 4

Turn on the PowerBook with the Power key on the external keyboard.

NOTE:

In this configuration, video only appears on the external monitor, not on the PowerBook display.

If the Power key on the external keyboard functions correctly, and the PowerBook turns on, a key on the PowerBook keyboard is pressing against the display housing. This can be caused by an improperly seated modem or RAM card raising the keyboard on the right side. Have an Apple-authorized Service Provider check the RAM or modem installation.

Performa & TelePort Gold II: Slow With PPP or SLIP (2/97)

Article Created: 18 September 1995
Article Reviewed/Updated: 6 February 1997

TOPIC -----

My modem appears to be slow when using a PPP or SLIP connection. Is there anything I can do to improve this?

DISCUSSION -----

Yes. Make sure that you have selected "CTS Only" from the communications settings dialog of your communications package. This turns on a form of unidirectional handshaking.

If you do not see this as an option, you may be running version 2.1.2 or earlier of the Global Village TelePort software. You should upgrade to 2.5.2 or later to acquire this feature. The communications software you are using may also need to be upgraded to support this feature.

Upgrades for Global Village products are administered directly by Global Village. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Check for system- and CPU-intensive activity. The Global Village TelePort Gold II modem (but not the IIv modem) uses software-based error correction and data compression, so performance may be affected by system activity. Operating with virtual memory on may also affect communication performance.

Next, make sure that you are not using a data compression protocol such as MNP5. You can check your modem's default protocol by opening the TelePort control panel (must be TelePort v2.5 or later software) and inspecting the port status. If you have data compression turned on, the modem attempts to compress data that may already be compressed, which could have the effect of slowing down your data transmission. You should either use V.42-bis, or no data compression or error correction.

The last thing you should check within your communications package is to see whether Xon/Xoff error checking is enabled. If Xon/Xoff is enabled, it can conflict with either automatic error correction, or the algorithmic processes which are normally used by your communications software.

Article Change History:

06 Feb 1997 - Minor typographical corrections.

30 Jan 1997 - Updated with software-based error correction information.

Open Transport: IPX Is Not Used For Internet Connections (9/95)

=====

Article Created: 18 September 1995

TOPIC -----

Does Open Transport send IPX packets when communicating through Internet connections such as an Internet Service Provider?

DISCUSSION -----

No. Open Transport uses TCP/IP for Internet communication and does not use the IPX protocol Internet connections, the IPX protocol is used with Novell Netware servers. As of September 1995, there is no Open Transport IPX driver from Apple Computer. For more information on IPX and Open Transport search the Technical Information Library for the following articles:

Color LaserWriter 12/600 PS: Page Count Keeps Resetting (9/95)

Revised: 9/18/95
Security: Everyone

Color LaserWriter 12/600 PS: Page Count Keeps Resetting (9/95)

=====

Article Created: 18 September 1995

TOPIC -----

The page count on my Color LaserWriter 12/600 PS resets every time I turn the printer off. How can I make sure that the page count information is retained when the printer is turned off?

DISCUSSION -----

The Color LaserWriter 12/600 PS uses a 3.6 volt lithium battery at location BT1 on the I/O controller to retain the page count and other parameters when the printer is powered off. If the battery voltage drops, or it is removed from the I/O controller, then the page count information will no longer be retained. Service Source contains additional information on battery testing and replacement procedures.

Replacement batteries are available as a service part using part number 742-0011.

DOS Compatibility Card: Time Set Only At Startup (9/95)

=====

Article Created: 18 September 1995

TOPIC -----

On my DOS Compatibility Card, if I switch back to the Mac OS and change the time, change back into Windows, the time has not changed. Why?

DISCUSSION -----

The time and date information for the DOS Compatibility Card are set at startup. The MS-DOS/Windows clock reads the Macintosh clock once at startup, then runs on its own. This means that you must restart the DOS Compatibility Card in order for any time or date changes to take affect.

At Ease 3.0: Use Desktop Printing 1.0.3 (1/96)

Article Created: 18 September 1995
Article Reviewed/Updated: 8 January 1996

TOPIC -----

I have an At Ease 3.0 Setup which puts my users in the Restricted Finder. Whenever a user tries to drag a file to a desktop printer, the computer freezes or locks up. Can I use desktop printing with At Ease?

DISCUSSION -----

If you want to allow users to drag documents from their Restricted Items folder in At Ease to a desktop printer, you should update to Desktop Printing Software version 1.0.3 available from online services.

Desktop Printing Software v1.0.3 is also included with the At Ease for WorkGroups 3.0.1 Updater available from online services.

These articles can help you locate the software updates mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

08 Jan 1996 - Added Desktop Printing Software v1.0.3 information.
09 Nov 1995 - Changed title and added resolution.
26 Oct 1995 - Clarified discussion.

PowerBook 150: Global Village Modem Software Update (10/95)

Revised: 10/4/95
Security: Everyone

PowerBook 150: Global Village Modem Software Update (10/95)

=====

Article Created: 18 September 1995
Article Reviewed/Updated: 3 October 1995

TOPIC -----

Since Apple doesn't make a modem for my PowerBook 150, I bought a Global Village internal modem which I was told would work with this model PowerBook. However, it doesn't seem to work quite right. I have heard that no modems work well with this PowerBook. Is that true? Is there something wrong with my system software or the modem itself?

DISCUSSION -----

You are correct in saying that the Macintosh PowerBook 150 does not support an Apple Express Modem. However, there are several third party internal modem options available to owners of these computers, including Global Village.

According to Global Village, their PowerPort family of modems (Bronze, Silver and Gold) are designed to work in the PowerBook 150. There is, however, a software update needed for the Macintosh PowerBook 150 computer users. You need to use the PowerPort 2.0.8a software, not the PowerPort 2.0.8 software which came with the modem. You will need to call Global Village to find out how to obtain the updated software.

NOTE: This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor (Global Village) for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Lotus Notes Client: Macintosh & DOS/Windows Difference (9/95)

=====

Article Created: 19 September 1995

TOPIC -----

I have a problem with Lotus Notes for Macintosh. I'm not actually getting an error, it's more of a missing feature that is annoying to Macintosh users. The problem deals with the default Macintosh window size when selecting a new form in the Compose menu. The default window created is small and must be expanded each time by clicking zoom box. The DOS and Windows version of Notes does not behave this way, that is, the last window size is remembered and used when you create a new form. Is this a Notes Macintosh client issue?

DISCUSSION -----

We spoke with Lotus and received confirmation that the difference in window size is due to the Macintosh Notes client. Lotus is aware of this situation, but has made no commitments as to when, or if, this will be changed in a future release of the Macintosh Notes client.

Color LaserWriter 12/600: Postscript Errors (9/95)

Revised: 9/19/95
Security: Everyone

Color LaserWriter 12/600: Postscript Errors (9/95)

Article Created: 19 September 1995

TOPIC -----

When I print to my Color LaserWriter 12/600, I get an error message stating something to the effect: a "set limitcheck", "VM Storage", "Offending command...", or "Range Check" error has occurred. Sometimes the printer just blinks and does not print. These errors are intermittent and occur in different documents and applications

DISCUSSION -----

The problem may appear to be with the printer since you can see the files on the screen, but they do not print. Many programs use QuickDraw to edit the images visually, then use Postscript to print. These errors are typically not due to hardware and a "Clean Install" usually will not repair the problem.

These problems are usually due to corruption in one or more elements in the output Postscript file. This article relates to errors in the saved Postscript information. Follow these procedures to try to isolate and correct the problem:

Restart the printer to clear the buffer in the printer. Then try the following procedures:

Corruption in an imported graphic

=====

Step 1

Go into the original application that created the graphic.

Step 2

Select the elements of the graphic and copy them to the clipboard.

Note: it is important not to "select all" in the original file, sometimes

elements in a file may not have been deleted properly and the printer can not interpret them.

Step 3

Paste the elements into a new file and save.

Step 4

Try printing again. If it still fails go to Step 5.

Step 5

Import the working graphic into the selected program (PageMaker, Word) and try to print again.

Large graphic elements

=====

Check for large elements that have been reduced. These images still comprise a large number of elements, and to Postscript, their actual size does not matter. Eliminate or redraw them, save the file, and try to print again.

Output resolution too high

=====

Check for output resolution. It should not be above 150 DPI (PageMaker, Illustrator, Freehand). The 12/600 is a 600 DPI printer, the maximum resolution Contone Compression keeps is 150 DPI. It will image the file at 600, but reduce it to 150 to fit the file through the ROMs.

Postscript interpretation memory conflict

=====

Check "split long paths option" in Illustrator or Freehand. These are Bezier curve drafting programs, long paths or connected segments can crash a Postscript interpreter when it runs out of storage area.

Note: If you print the desktop for troubleshooting purposes be aware that the low resolution of the desktop file may cause the icons to print with a halo effect. This is normal. The best test of the printer is to make a new simple color document, type out a few words and try printing.

Bootp and Open Transport Configuration (9/95)

Revised: 1/4/96
Security: Everyone

Bootp and Open Transport Configuration (9/95)

=====

Article Created: 19 September 1995

TOPIC -----

Open Transport TCP/IP is configured to use bootp. It seems that the Domain Name Server, router, and domain name is not being returned properly. What is the problem?

DISCUSSION -----

The most common issue with Open Transport TCP/IP configuration is, the bootp server has not been configured to return a domain name, and no domain name was specified in the Open Transport TCP/IP control panel.

In order to permit the resolution of partially qualified domain names, Open Transport TCP/IP requires a domain name to be configured, either in the control panel, or from your BOOTP/DHCP server. This corresponds to the default domain in MacTCP. In order to use the DNR at all, Open Transport TCP/IP also needs the address of at least one domain name server, but it can also be configured or returned from a server. This information was included in the Open Transport documentation, but did not get included in balloon help.

Solution

Either configure the bootp server to return a domain name, or enter a domain name in the TCP/IP control panel. You must be in Advanced user mode in the Open Transport TCP/IP control panel to do this.

AWS 95: A/UX Standalone Program Failure (9/95)

Revised: 9/19/95
Security: Everyone

AWS 95: A/UX Standalone Program Failure (9/95)

Article Created: 19 September 1995

TOPIC -----

When booting into the A/UX environment on my Apple Workgroup Server (AWS) 95 I get a message that it could not launch because of a "standalone program failure." It further indicates that the "standalone program space is too small" because "this is a memory sharing system or the system heap is too large."

DISCUSSION -----

This message results from the addition of extensions or control panels to the System Folder of the MacPartition. These extensions or control panels can modify the system heap to the point that it takes more space than expected for A/UX launch.

If you know what extension or control panel was added, you can remove it by starting up with extensions off (depress the shift key during startup) and then deleting the extensions or control panels.

If you are unsure what was added, a clean install of the A/UX Startup Files would be recommended. This can be accomplished by following the steps below:

Step 1

Startup with the Disk Tools diskette.

Step 2

Remove the System Folder from the MacPartition by moving it to the Trash and then selecting Empty Trash from the Special menu.

Step 3

Select Shut Down from the Special Menu.

Step 4

Insert the AWS 95 Installation Boot Disk and the AWS 95 System Software
Installer CD and restart the server.

Step 5

Select Custom Install.

Step 6

Select Step 2: Install Startup.

Step 7

Once the installation is complete, select Quit. Your server will then restart
with the new software.

NOTE: If your server is not on LocalTalk you will need to open the Network
control panel and select the appropriate network interface after it restarts.

Macintosh Clients and Novell Frame Types (9/95)

Revised: 9/19/95
Security: Everyone

Macintosh Clients and Novell Frame Types (9/95)

=====

Article Created: 19 September 1995

TOPIC -----

What frame type is used by Macintosh computers interacting with a Novell Netware server using AppleTalk?

DISCUSSION -----

Novell Netware servers support four different frame types for Ethernet cards. These frame types and their associated protocols are as follows:

Begin_Table

Frame Type	Protocols
-----	-----
EtherNet_802.2	IPX/SPX, and FTAM
Ethernet_802.3	IPX/SPX
Ethernet_II	IPX/SPX, TCP/IP, and AppleTalk Phase I
Ethernet_SNAP	IPX/SPX, TCP/IP, and AppleTalk Phase II

End_Table

Except in rare cases where AppleTalk Phase I is still in use, Netware administrators will want to bind Ethernet_SNAP to the server's Ethernet card servicing Macintosh clients.

Power Macintosh 7500/8500: Missing Automated Tasks (9/95)

Revised: 9/20/95
Security: Everyone

Power Macintosh 7500/8500: Missing Automated Tasks (9/95)

=====

Article Created: 20 September 1995

TOPIC -----

The "About Automated Tasks" Read Me file on the Power Macintosh 7500 and 8500 series computers refers to the following AppleScripts: "Turn on Filesharing," "Turn off Filesharing," "Sound On," and "Sound Off." Unfortunately, these AppleScripts are not included on the Apple Macintosh CD nor are they preinstalled on the hard drives of these computers.

DISCUSSION -----

There are two workarounds to provide the functionality of these AppleScripts:

Control strip modules

The functionality provided by all four of these Applescripts is available via the Control Strip software that ships with the Power Macintosh 7500 and 8500.

Install and create additional AppleScripts

The "Start File Sharing" and "Stop File Sharing" tasks are installed by the PlainTalk 1.4 English Speech Recognition software. After installing this software, these files can be found in the "Speakable Items" folder.

The "Turn Sound On" and "Turn Sound Off" files are not installed by PlainTalk 1.4 English Speech Recognition software. However, you can use the Script Editor to recreate these files. The script of the "Turn Sound Off" task is as follows:

```
on run
    tell application "Finder"
        set volume 0
        beep
```

```
        display dialog "Your system beep has been turned off." buttons {"OK"}
default
        button 1
    end tell
end run
```

The script of the "Turn Sound On" task is as follows:

```
on run
    tell application "Finder"
        set volume 5
        beep
        display dialog "Your system beep has been turned on." buttons {"OK"} default
            button 1
        end tell
    end run
```

Open Transport 1.0.x: Using Serial Printers (7/96)

Revised: 7/22/96
Security: Everyone

Open Transport 1.0.x: Using Serial Printers (7/96)

Article Created: 20 September 1995
Article Reviewed/Updated: 22 July 1996

TOPIC -----

I have a Power Macintosh 9500 and a LaserWriter Select 310. I cannot print to the LaserWriter Select 310 when connected using the printer port in the AppleTalk control panel. When I go into the Chooser and select the printer port, I get a message that says "Laserwriter Select 310 cannot be used on the Printer port while AppleTalk is active. Do you want to make AppleTalk inactive?" It makes no difference whether I click "OK" or "Cancel" in the dialog box. I get the same message again when I go back to select the printer port in the Chooser. What can I do to correct this?

DISCUSSION -----

This is a known issue with versions 1.0, 1.01, 1.06, and 1.07 of Open Transport on the Power Macintosh 7200, 7500, 8500, and 9500. This problem is caused by a delay when the printer port is released by the LocalTalk driver, and it can occur with other serial printers. The delay in releasing the printer port increases if you repeatedly click through the dialog boxes in the Chooser or repeat the procedure over and over.

This was fixed in version 1.1 and later of Open Transport. You should update to version 1.1, or later of Open Transport.

Article Change History:

22 Jul 1996 - Updated discussion to include information on 1.1 of OT.

System 7: Reblessing Old System Folder After Clean Install 2/97

Revised: 2/20/97
Security: Everyone

System 7: Reblessing Old System Folder After Clean Install 2/97

Article Created: 20 September 1995
Article Reviewed/Updated: 19 February 1997

TOPIC -----

I have performed a clean install of my system software. However, the clean install did NOT resolve the issue, nor did any of the follow-on troubleshooting. Is there any way I can reactivate my old System Folder, without having to reinstall the system software and all the other system resources I had?

DISCUSSION -----

Yes, if you have not already thrown away your original System Folder, you can "re-bless" it. Note that this process may not always work. If the steps listed below do not work, you will have to reinstall a System Folder one more time, then complete the steps listed in your clean install instructions.

Due to the wide variety of situations a clean restore can be used to troubleshoot, be sure to read the instructions below carefully, in order to determine whether your overall initial issue would benefit from this procedure. If you are troubleshooting SCSI issues in particular, make sure you have resolved those issues before proceeding. If you are not sure, do not follow these steps.

To rebless your System Folder, proceed as follows:

Step 1

Start the computer from an external floppy disk or a startup CD.

Step 2

Close all your windows, then open your hard disk.

Step 3

Choose "by Name" from the View menu. Verify that the System Folder has a small picture of an original Macintosh in the middle of its icon. This will resemble a picture of a monitor. This is the currently blessed system folder that is running your computer.

Step 4

Open this System Folder. Move the System suitcase into the Preferences folder. Close the System Folder.

Step 5

Verify that this System Folder no longer has the original Macintosh icon.

Step 6

Rename the System Folder "Clean System Folder".

Step 7

Rename the original System Folder (the one you wish to use again, not the one from Step 6) back to "System Folder".

A. If you used System 7.5's "Clean Install" option, open the System Folder, double-click on your System suitcase. Close the window which appears, then close the System Folder.

1) If a picture of an original Macintosh does not appear in the middle of this folder's icon, open the System Folder again.

2) Drag the System suitcase and the Finder to your hard disk icon.

3) Close the System Folder.

4) Open your hard drive and drag the System suitcase and the Finder on top of the System Folder icon. The original Macintosh icon should appear on the System folder immediately.

B. If you used another type of clean restore, you ordinarily would have had to separate the System suitcase and the Finder from each other. One of these files would have been placed in the Trash, or in your Preferences folder, or someplace other than loose in the System Folder. You need to find the System suitcase and the Finder, move them to your hard disk, close your System Folder, and drag them on top of your System Folder icon. The original Macintosh icon should appear on the System Folder icon immediately.

Step 8

Restart your computer. It should start up from the original System Folder. If it does not, repeat the original clean install steps.

Step 9

Put "Clean System Folder" into the Trash and empty the Trash. Note that you will lose all data in this System Folder, make sure that you have not installed any software in that System Folder except for the basic system software.

Macintosh Performa 6300CD: Description (4/97)

Article Created: 20 September 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides a description of the Macintosh Performa 6300CD.

DISCUSSION -----

The most powerful and versatile Performa system ever created brings you increased system speed and enhanced communications performance.

The Apple Macintosh Performa 6300CD computer uses a state-of-the-art PowerPC 603e processor running at 100 megahertz to deliver up to 50 percent higher performance than previous 603-based systems.

The Performa 6300CD will meet your needs well into the future, not only with its leading-edge performance, but also with a 1.2 gigabyte hard drive – large enough to store applications and information for years to come.

This affordable system includes multimedia features that are expensive add-ons with other computers. A quadruple-speed CD-ROM drive accesses CD-based data quickly and plays audio and video segments smoothly. Stereo 16-bit sound provides high-quality audio playback, while an audio-input port lets you record your own sounds. Adding advanced multimedia options is easy. You can plug in a video-input card, a video-output interface box, an internal TV tuner, and other optional devices.

The Performa 6300CD also comes with special features for telephony. The high-speed (28.8 kilobits per second) modem works with the Apple PlainTalk microphone (included with the computer) and special software to let you use the computer as a speakerphone and an answering machine.

The 6300CD is a complete, ready-to-use multimedia system. Packed in one box are the computer (with Mac OS 7.5.1 software already loaded), a color display, a keyboard, a mouse, an internal modem, and a microphone. Also included are more

than a dozen home, education, and home-business programs, plus a collection of multimedia reference CDs.

Features

=====

Power and Speed

- PowerPC 603e processor running at 100 MHz
- Integrated floating-point unit
- 40 MHz, 64-bit bus
- 256K Level 2 cache
- 32K internal cache

Display

- 15" flat square shadow mask CRT
- .28 mm dot pitch
- Resolutions from 640x480 to 832x624

Video support

- Apple displays up to 15 inches through a 1MB DRAM video buffer (independent of system RAM)
- Wide range of VGA and SVGA displays from other vendors
- Offers 16-bit color for display of up to 32,768 colors on monitors using 640x480-pixel resolution
- Provides 8-bit color for display of 256 colors on monitors using 800x600-pixel or 832x624-pixel resolution

Memory

- Comes with 16MB of RAM
- Can be expandable to 64MB of RAM using two 32MB SIMMs
- Uses 72-pin, noncomposite, 80-nanosecond or faster DRAM SIMMs

Expansion

- Apple Desktop Bus port for mouse, keyboard, and other devices
- Monitor port (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- Serial port (RS-232/RS-422) for an AppleTalk network connection, other networking or communications equipment, or a printer
- SCSI interface port for connecting as many as five external SCSI devices, such as disk drives or CD-ROM drives
- LC processor-direct expansion slot
 - Compatible with most Macintosh Performa 400 and 500 series; Performa 630; Macintosh Quadra 605; and Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630 processor-direct cards
 - Can be used for an Apple MPEG Media System card or other specialized card
- Communications slot for a 28.8-kbps fax/data/voice modem (used by Global Village modem)

..TIL18612-Macintosh_Performa_6300CD-Description_4-97.pdf

- Video slot for optional Apple Video System (NTSC, PAL, and SECAM video input)
- Dedicated connector and infrared remote receiver for optional internal Apple TV/Video System (provides TV tuner and video input)

Audio System

- Stereo 16-bit sound
- Built-in speaker
- Sound-output port
- Sound-input port (can be used to connect the Apple PlainTalk microphone included with the computer)
- Front headphone jack and volume control

Bundled software

=====

System Software

- Mac OS 7.5.1 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, and Macintosh PC Exchange software

Pre-installed software

- At Ease
- ClarisWorks
- The American Heritage Dictionary
- ClickArt Performa Collection
- Espresso
- Lode Runner
- MacGallery Clip Art Treasure Pak
- MacLinkPlus/Easy Open Translators
- Mangia (special Performa edition)
- Power Pete
- Quicken
- Virex
- WealthBuilder
- The Writing Center
- Megaphone
- Megaphone Tour
- Adobe Acrobat
- Global Fax
- Global Fax Tour

CD-ROM titles

- 1995 Grolier Multimedia Encyclopedia
- TIME Almanac Reference Edition
- 3D Atlas
- The Family Doctor
- Smithsonian's America

- My First, Incredible, Amazing Dictionary
- Sesame Street Numbers
- Making Music by Voyager
- Club KidSoft CD

Configuration and Ordering Information

=====

Macintosh Performa 6300CD 16/1.2GB/4xCD/28.8

- Macintosh Performa 6300CD computer with 16 MB of RAM, 1 MB of video memory, built-in AppleCD 600i internal quadruple speed CD-ROM player, 1.4 MB Apple SuperDrive floppy disk drive, internal 1.2 GB hard disk drive
- Global Village 28.8 Gold IIv modem
- Apple Multiple Scan 15" Display
- AppleDesign Keyboard
- Apple PlainTalk microphone
- Order number M4425LL/A

Optional Enhancements

- Apple MPEG Media System

Order No. M4243LL/A

- Apple Video System

Order No. M2894LL/C

- Apple TV/Video System

Order No. M2896LL/C

- Apple Presentation System

Order No. M2895LL/A

- Apple Ethernet LC Thin Coax Connection

Order No. M33462Z/A

TOPIC -----

This article provides technical specifications for the Macintosh Performa 6300CD.

DISCUSSION -----

Hardware
=====

Microprocessor

- PowerPC 603e processor running at 100 MHz
- Integrated floating-point unit
- 40 MHz, 64-bit bus
- 256K Level 2 cache
- 32K internal cache

Memory

- Comes with 16MB of RAM (uses one SIMM socket)
- Can be expandable to 64MB of RAM using two 32MB SIMMs
- Uses 72-pin, noncomposite, 80-nanosecond or faster DRAM SIMMs

Storage

- Internal 1.2GB hard disk drive
- Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal, quadruple-speed AppleCD 600i CD-ROM drive

Monitor (Apple Multiple Scan 15 Display)

- 15-inch diagonal RGB color display (13.3-inch diagonal viewable image size)
- Up to 832- by 624-pixel resolution at a scan frequency of 75 Hz
- 0.28-mm dot pitch
- Meets the strictest international magnetic-field emissions requirements (SWEDAC MPR2)

Display Support

- Apple displays up to 15 inches through a 1MB DRAM video buffer (independent of system RAM)
- Wide range of VGA and SVGA displays from other vendors

Colors and Resolutions

Begin_Table

Resolution	Max. Bit Depth	Max. Number of Colors
640 x 480	16	32,768
800 x 600	8	256
832 x 624	8	256

End_Table

Interfaces

- Apple Desktop Bus port for mouse, keyboard, and other devices
- Monitor port (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- Serial port (RS-232/RS-422) for an AppleTalk network connection, other networking or communications equipment, or a printer
- SCSI interface port for connecting as many as five external SCSI devices, such as disk drives or CD-ROM drives
- LC processor-direct expansion slot
 - Compatible with most Macintosh Performa 400 and 500 series; Performa 630; Macintosh Quadra 605; and Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630 processor-direct cards
 - Can be used for an Apple MPEG Media System card or other specialized card
- Communications slot for a 28.8-kbps fax/data/voice modem (used by Global Village modem)
- Video slot for optional Apple Video System (NTSC, PAL, and SECAM video input)
- Dedicated connector and infrared remote receiver for optional internal Apple TV/Video System (provides TV tuner and video input)

Sound

- Stereo 16-bit sound

- Built-in speaker
- Sound-output port
- Sound-input port (can be used to connect the Apple PlainTalk microphone included with the computer)
- Front headphone jack and volume control

Communications

- Global Village 28.8-kbps fax/data/voice/modem
- Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)
- Megaphone software lets users turn their Macintosh Performa 6300CD into a speakerphone and digital answering Machine; included fax software allows users to send and receive fax communications

Keyboard

- Provides adjustable keyboard slope
- Includes function keys, numeric keypad, cursor arrow keys, and special screen-editing keys

Mouse

- Round shape fits contour of the palm of the hand
- Large button allows easy clicking and dragging

Electrical Requirements

Main Unit

- Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- Frequency: 50 to 60 Hz
- Power: 55 W maximum

Monitor

- Line voltage: 90-132, 198-260 V
- Frequency: 47-63 Hz
- Power: 90 W maximum

Size and Weight

Main Unit

- Height: 4.3 in. (10.95 cm)
- Width: 12.6 in. (32.0 cm)
- Depth: 16.5 in. (41.9 cm)
- Weight: 19 lb. (8.6 kg)

Monitor

- Height: 16.7 in. (42.4 cm)
- Width: 15.9 in. (40.5 cm)
- Depth: 17.8 in. (45.2 cm)
- Weight: 31.0 lb. (14 kg)

Operating Environment

=====

Main Unit

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 5% to 95%, noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Monitor

- Operating temperature: 10 to 40 degrees C (50 to 104 degrees F)
- Storage temperature: 0 to 60 degrees C (32 to 140 degrees F)
- Relative humidity: 20% to 95%
- Maximum altitude: 10,000 ft. (3000 m)

Bundled Software

=====

System Software

- Mac OS 7.5.1 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, and Macintosh PC Exchange software

Disability Access

- CloseView software magnifies image up to 16 times
- Easy Access software for sequential combination keys, and cursor control from the numeric keypad
- "Visual beep" replaces audible system alerts

Multiple Scan 1705 Display: Description (10/95)

=====

Article Created: 20 September 1995
Article Reviewed/Updated: 6 October 1995

TOPIC -----

This article provides a description of the Multiple Scan 1705 Display.

DISCUSSION -----

Overview
=====

Apple's most affordable full-page display, the Apple Multiple Scan 1705 Display is a flexible, high-quality monitor that's perfect for business tasks such as creating presentations, word processing, and working with spreadsheets. It features a high-quality flat, square shadow mask CRT; offers a number of advanced features; and even comes with a PC video adapter, so you can easily use it with your MS-DOS and Windows software-based systems as well as with your Macintosh computers.

For flexibility, the Apple Multiple Scan 1705 Display uses multiple-scan technology, so you can adjust the resolution to suit the particular application in which you are working. For Macintosh users, it offers three different viewing modes: a page-layout mode that lets you view two full pages simultaneously; a publishing mode that provides 72-dot-per-inch resolution for everyday work; and a presentation mode that lets you use the display as if it were a 14-inch, 24-bit color monitor. And users of PC-compatible systems can enjoy a similar range of resolutions.

The Apple Multiple Scan 1705 Display is both simple to set up and enjoyable to use. It's easy to connect the display to your system; and it comes with a PC adapter for use with IBM PC compatibles, enabling plug-and-play connection no matter what kind of computer you use. To minimize distortion, the Apple Multiple Scan 1705 Display features an anti-reflection panel. And it's conveniently located digital controls let you adjust brightness, contrast, geometry, centering, and convergence for optimal viewing convenience.

With its combination of advanced features and low cost, the Apple Multiple Scan 1705 Display is an excellent choice for anyone looking to move up affordably to a full-page display.

Features

=====

Outstanding image quality

- Features a high-quality flat, square shadow mask CRT for clear, sharp pictures and vivid color
- Includes digital controls that let you adjust precisely for brightness, contrast, geometry, centering, and convergence
- Includes ColorSync profiles to support color accuracy

Advanced functionality

- Uses multiple-scan electronics that enable a high level of user flexibility
- Offers a range of resolution modes—up to 1,024 by 768 pixels
- Comes with mode-switching software to allow resolution changes without restarting

Ergonomic design

- Comes with a tilt-and-swivel base that allows you to position the monitor for optimal viewing comfort
- Provides the convenience of front-panel controls
- Features an antireflection and antistatic surface treatment, with a flicker-free 75-hertz refresh rate to minimize eyestrain
- Complies fully with MPR II standards for low electrical and magnetic emissions
- Complies with the EPA's Energy Star conservation guidelines by switching into low-power mode during idle periods

Compatibility and affordability

- Works with Power Macintosh, Macintosh Quadra, Macintosh Centris, Macintosh II, and PowerBook computers
- Includes a PC adapter for plug-and-play IBM PC compatibility
- Supports Windows 95 plug-and-play connection with alternate cable
- Provides advanced capabilities at an affordable price

Configuration and Ordering

=====

Apple Multiple Scan 1705 Display

Order No. M4434LL/A

- Apple Multiple Scan 1705 Display
- Apple Multiple Scan software
- PC adapter

- Video cable
- Power jumper cable
- User's guide
- Limited warranty

Multiple Scan 1705: Specifications (1/96)

=====

Article Created: 20 September 1995
Article Reviewed/Updated: 3 January 1996

TOPIC -----

This article provides the technical specifications for the Apple Multiple Scan 1705 Multiple Scan Display.

DISCUSSION -----

Hardware
=====

Picture tube

- 17-in. (diagonal) flat, square shadow mask
- 15.8 in. (diagonal viewable image size)
- .28-mm dot pitch

Screen treatment

- Antistatic, antiglare coating

Digital controls

- Brightness
- Contrast
- Horizontal size and centering
- Vertical size and centering
- Pincushion
- Power switch
- Trapezoid
- Degauss

Connector

..TIL18615-Multiple_Scan_1705-Specifications_1-96.pdf

- 15-pin DSub connector for Macintosh systems
- HD15-pin adapter for PCs

Degauss circuitry

- Front-panel control

Electrical requirements

- Line voltage: 90 to 132 V AC and 198 to 264 V AC
- Frequency: 47 to 63 Hz, single phase
- Power: 165 W (maximum) when operating; less than 11 W in standby mode; 0 W in suspend mode and when CPU is in energy-saver mode

Environmental requirements

- Temperature: 50 to 104 deg. F (10 to 40 deg. C)
- Humidity: 10% to 80%, noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and weight

- Height: 17.2 in. (43.7 cm)
- Width: 16.5 in. (41.9 cm)
- Depth: 18.8 in. (47.8 cm)
- Weight: 45.2 lb. (20.3 kg)

Resolution/Screen refresh rate

Macintosh computers

- 832 by 624 pixels at 75 Hz—presentation view
- 640 by 480 pixels at 67 Hz—publishing view
- 1,024 by 768 pixels at 75 Hz—page-layout view

PC-compatible systems

- 640x480 pixels at 60 Hz (VGA)
- 800x600 pixels at 60 Hz (SVGA)
- 1,024x768 pixels at 60 Hz (SVGA)

Scanning rates

- 30 to 65 kHz (horizontal)
- 50 to 120 Hz (vertical)

Active Display Area

- Diagonal - 15.8 in.
- Width - 12.6 in.
- Height - 9.5 in.

Agency approvals

=====

- FCC Part 15 Class B
- CISPR 22 Class A (EN5008211) – complies with European EMC directive
- DOC Class B
- MPR II
- VCCI Class 2
- CE Mark
- EPA Energy Star compliant
- IEC 950
- UL1950
- CSA 950
- EN60950

System requirements

=====

- Power Macintosh, Macintosh Quadra, Macintosh Centris, Macintosh II (with video card), and PowerBook computers
- System software version 7.1 or later

Macintosh 5xxx/6xxx: Microprocessor Issue (4/97)

Revised: 4/3/97
Security: Everyone

Macintosh 5xxx/6xxx: Microprocessor Issue (4/97)

Article Created: 21 September 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article covers two topics - 1) Running the 5xxx/6xxx Tester application when experiencing system freezing on selected Performa and Power Macintosh computers.

2) This article describes an issue with some PowerPC 603 microprocessors installed on a limited number of Macintosh and Performa 5200 and 6200 series computers. Previously, this required the use of the 52xx/62xx Diagnostic Utility, which has since been removed.

DISCUSSION -----

1) The 5xxx/6xxx Tester should be used to test for known component issues that may cause system freezing in ALL Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers, including the Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.) The 5xxx/6xxx Tester is available on America Online (keyword: applecomputer) CompuServe (GO APLSUP) and on the Internet at:

ftp://ftp.info.apple.com/Apple.Support.Area/Apple.Software.Updates/US/Macintosh/Utilities/5xxx-6xxx_Tester_1.0.sea.hqx

2) The 52xx/62xx Diagnostic Utility was made available to detect an issue with a small number of PowerPC 603 microprocessors used in ONLY Macintosh Performa 5200, 6200, and Power Macintosh 5200/75 LC computers. Only computers within a specific serial number range were potentially affected by this issue. The Diagnostic Utility was posted on the online services, but it has since been removed with the posting of the 5xxx/6xxx Tester. Below is some additional information on this original problem.

PowerPC 603 Microprocessor Statement

Apple and Motorola have recently found that a small number of PowerPC 603 microprocessors used in Macintosh Performa 5200, 6200, and Power Macintosh 5200/75 LC systems may have a problem. Fewer than 1 in 1000 of these systems may have a PowerPC 603 processor problem which was not detected in test procedures at the microprocessor design facility and at Apple. No customer has reported this issue to Apple that we are aware of.

Only Macintosh Performa and Power Macintosh LC models in the 5200 and 6200 series with serial numbers in the following ranges could be impacted:

5200 Series Computers

XB514xxxxxxx - XB529xxxxxxx
SO514xxxxxxx - SO529xxxxxxx
SG523xxx - SG527xxx
numbers less than CK533xxxxxxx

6200 Series Computers

XB528xxxxxxx - XB529xxxxxxx
SO528xxxxxxx - SO529xxxxxxx
SG510xxx - SG528xxx
numbers less than CK533xxxxxxx

Computers outside the above serial number ranges have been screened with additional test procedures and do not have this problem. No other Power Macintosh, Power Macintosh LC, Performa, or PowerBook computers experience this problem.

On September 21, 1995, Apple posted a diagnostic utility called "52xx/62xx Diagnostic Utility" that checks for this potential problem to a number of online services including the internet and CompuServe. This application was removed when the 5xxx/6xxxx Tester was posted.

Apple Service inventory has been tested and does not have this problem.

Below is a Q & A which may answer more of your questions.

.....

Question: How does this problem manifest itself?

Answer: Tests indicate it may affect the Graphing Calculator application, or other PowerPC native applications using specific mathematical operations in a specific sequence. In some cases it may cause an application to unexpectedly freeze.

Question: Does it impact spreadsheet applications?

Answer: Although we have not been able to duplicate this problem with these applications, it is possible.

Question: What are the serial numbers affected?

Answer:

5200 Series Computers

XB514xxxxxxx - XB529xxxxxxx

SO514xxxxxxx - SO529xxxxxxx

SG523xxx - SG527xxx

numbers less than CK533xxxxxxx

6200 Series Computers

XB528xxxxxxx - XB529xxxxxxx

SO528xxxxxxx - SO529xxxxxxx

SG510xxx - SG528xxx

numbers less than CK533xxxxxxx

Question: When will customers be alerted?

Answer: On September 21,1995, Apple will post the diagnostic utility on various online services along with this document.

Question: How will customers be alerted?

Answer: We are notifying our customers in a number of ways. Each company has posted a diagnostic test on various online services, including Apple and Motorola home pages on the World Wide Web, and CompuServe. Customers can download and run this diagnostic on their computer to determine if it is one of the few that may have a PowerPC 603 processor with a problem.

Customers in America or Canada without access to an online service can call Apple at 800-785-7371 (7:00am-7:00pm, Mountain Standard Time) to have the diskette with the diagnostic utility sent to them within two business days. International customers should contact their local Apple service center.

Question: What are the specific online paths to the diagnostic?

Answer: The diagnostic, along with a ReadMe and a Q & A document, are included in a file titled "52XX/62XX Diagnostic Util.SEA" posted to the following locations:

America Online:

keyword: applecomputer

CompuServe:

Apple Support Forum (GO APLSUP) contains all software and information libraries
Apple Most Popular files (GO APLNEW)

Internet:

World Wide Web: <<http://www.info.apple.com/swupdates>>
ftp: <<ftp://ftp.info.apple.com>>

Question: If customers determine their system contains the problematic PowerPC 603 processor, what should they do?

Answer: If the customer runs the diagnostic utility and it confirms that the system has a potentially problematic PowerPC 603 processor, and their computer has a serial number in the specified range, Apple will replace their logic board at no cost.

The customer may bring their computer to an Apple Authorized Service Provider or call 1-800-780-0957, before December 31, 1995, to schedule a service call. After that date, customers should call their service provider or 1-800-SOS-APPL for service.

International customers should contact their local Apple service center for replacement of their logic board, should it be necessary.

Question: Is this like the Pentium bug?

Answer: No it is not. The Pentium issue was inherent in the Pentium microprocessor design. Every Pentium had this problem before a modification to the design was made.

In this instance with the PowerPC 603 processor, there is no design flaw in the PowerPC 603 processor itself. Instead, a few problematic units that should have been rejected were not identified by the test procedures. Apple and Motorola reacted quickly to research and identify the problem. Both companies have instituted revised test procedures for the PowerPC 603 processor to ensure all current shipping systems are unaffected by this issue.

Question: What have you done since you discovered the problem?

Answer: Additional tests have been implemented at both the chip design and manufacturing facilities, and at Apple to catch this problem. Apple and Motorola are now extensively testing the PowerPC 603 processor to ensure all current shipping systems are unaffected by this issue.

Question: How many units could be affected?

Answer: We believe the total number of units worldwide to be well below 500.

Apple Internet Connection Kit: Product Details (9/95)

=====

Article Created: 21 September 1995

TOPIC -----

This article provides the product details of the Apple Internet Connection Kit (AICK).

DISCUSSION -----

Product Details

Apple Internet Dialer on-line Internet service registration software

- Offers a choice of qualified Internet service providers in your area
- Streamlines the process of registration for Internet service
- Configures the applications to run on your system

Netscape Navigator browser software

- Allows you to browse the World Wide Web

Claris EMailer Lite e-mail software

- Enables you to receive and send Internet e-mail messages via an intuitive drag-and-drop interface

Fetch FTP software

- Lets you access File Transfer Protocol (FTP) services to download specific files

Aladdin Stuffit Expander decompression software

- Automatically decompresses files that you download from the Internet

NewsWatcher browser software

- Allows access to Usenet newsgroup discussions

SLIP and PPP software

- Allows the use of MacTCP over your modem line, so your Macintosh and Internet applications can communicate with the protocols used by the

Internet (SLIP and PPP)

NCSA Telnet terminal emulation software

- Allows your Macintosh to emulate a terminal for connection to many libraries and catalogs

QuickTime VR Player

- Lets you view multimedia presentations and video clips over the Internet

Adobe Acrobat Reader

- Lets you view portable document format (PDF) files in their exact original format

RealAudio Player

- Enables you to hear programmed audio real-time over the Internet

Support

- "Getting started" guide helps you get acquainted with your new tools and the Internet and shows you how to navigate it

On-line help

- Includes Internet-specific Apple Guide on-line help
- Offers third-party documentation on CD
- Telephone support for installation and configuration

System requirements

- An Apple Macintosh, Power Macintosh, PowerBook, or other Mac OS-based computer
- At least 8MB of RAM
- Macintosh system software version 7.5 or later
- A 9,600-bps (or faster) modem (14,400 bps recommended) or a connection to a local area network that is already connected to the Internet
- A minimum of 10 MB of available hard disk space (15MB recommended)
- A high-density floppy disk drive or CD-ROM drive

Ordering Information

Apple Internet Connection Kit

Order No. M4276LL/A

- CD-ROM and floppy disks, each containing all of the Internet software and support (including electronic documents) described in Product Details

Order No. M4503LL/A

- 20-user version (CD-ROM and floppy disks)

For information regarding volume licensing, contact Apple Software Licensing at: vol.license@applelink.apple.com.

Apple Internet Connection Kit: Product Description (9/95)

=====

Article Created: 21 September 1995

TOPIC -----

This article describes the Apple Internet Connection Kit (AICK).

DISCUSSION -----

The Apple Internet Connection Kit is an integrated collection of Apple and third-party software that allows a Macintosh computer user to connect directly to the Internet quickly and easily. It's the perfect solution for users who want direct Internet access today.

The popularity of the Internet continues to grow exponentially, as more and more people discover the amazing information and communication resources available on line. But navigating (or "surfing") the Internet requires more than just a desire to try it. You need a variety of software tools -- browsers, viewers, file-transfer programs, e-mail, and more -- as well as a qualified Internet service provider. In fact, setting up your computer for Internet connection can be a time consuming process.

Luckily, Macintosh users who want to connect to the Internet already have one big advantage: right out of the box, the Macintosh is the easiest-to-use computer available. Now Apple has made direct Internet connection for Macintosh owners easier than ever.

With the Apple Internet Connection Kit, you get high-quality, "best of class" software in all of the categories you need for successful Internet access and use. You also get the Apple Internet Dialer, which makes signing up with a qualified Internet service provider and getting connected to the Internet a matter of minutes rather than days. Just double-click the application and fill in the blanks, and the Apple Internet Dialer will call a service provider for you. Within minutes, you'll be connected to the Internet -- where you can send and receive e-mail, conduct research, plan your own travel itinerary, play games, shop, and much, much more.

..TIL18622-Apple_Internet_Kit-Product_Description_9-95.pdf

Because dealing with the Internet sometimes raises more questions than it answers, the Apple Internet Connection Kit includes a "getting started" manual and special Apple Guide on-line help, as well as third-party documentation.

The Apple Internet Connection Kit -- the easiest, fastest, most complete tool for connecting your Macintosh computer directly to the Internet.

Features

Quick, direct Internet access

- Features software that makes signing up with an Internet service provider a quick, on-line process
- Includes all of the software tools needed for direct Internet access
- Enables local area networks that are connected to the Internet to standardize on one set of Internet tools
- Gets you to all the Internet hot spots: the World Wide Web (WWW), newsgroups, and FTP servers

Ease of use

- Provides an all-in-one solution for Internet connection
- Installs easily; one-button install for all key applications
- Configures Internet applications for your system automatically
- Compatible with other Internet tools

Applications included

- Apple Internet Dialer, on-line Internet service registration and connection software
- Netscape Navigator
- Apple Guide
- Claris EMailer Lite
- Fetch
- Aladdin Stuffit Expander
- NewsWatcher
- NCSA Telnet
- QuickTime VR Player
- Adobe Acrobat Reader
- RealAudio Player

Technical support

- Includes a "getting started" guide
- Features on-line help via Apple Guide
- Provides third-party documentation

Apple's Internet Products (4/97)

=====

Article Created: 21 September 1995
Article Reviewed/Updated: 19 April 1997

TOPIC -----

This article provides a brief description Apple Computer's internet products which include:

- Apple Internet Connection Kit
- K-12 Personal Internet Solution
- Apple Internet Server Solution for the World Wide Web
- QuickTime Products
- AppleSearch
- Apple Remote Access
- Apple Internet Router
- Apple IP Gateway

DISCUSSION -----

The Internet is a truly global resource, containing prodigious amounts of information on virtually every area of interest. It's no surprise that the Internet is being used by millions of people from all walks of life: business professionals who want to show the world their products and services, teachers who want to bring the world into their classrooms, and anyone who needs to keep in touch with others by e-mail.

It's also no surprise that Apple, the company most responsible for enhancing the personal computing experience, is at the forefront of making the Internet and its valuable resources more accessible. With the builtin communications technologies of the Mac OS and the products listed below, Apple has the solutions you need for accessing information, publishing, and authoring on the Internet.

Apple Internet Connection Kit (AICK)

The Apple Internet Connection Kit is an integrated collection of Apple and "best

of class" third-party software that allows a Macintosh computer user to connect directly to the Internet quickly and easily. Designed as an all-in-one solution for people who are very comfortable with their Macintosh and enjoy exploring on their own, the kit lets users sign up with a qualified Internet service provider, enabling them to establish an Internet connection within minutes. It includes a "getting started" guide, Apple Guide on-line support, third-party documentation, and the following Internet applications:

- Apple Internet Dialer software for quick, on-line registration with a qualified Internet service provider
- Netscape Navigator for browsing the World Wide Web
- Claris EMailer Lite
- Fetch FTP software for downloading files from FTP servers
- Alladin Stuffit Expander decompression software
- NewsWatcher Usenet news reader
- NCSA Telnet for connecting to UNIX-based libraries and catalogs
- QuickTime VR Player software
- Adobe Acrobat Reader
- RealAudio Player

K-12 Personal Internet Solution

Part of the Apple Education Series, the Personal Internet Solution Bundle is designed as the complete solution for the educator who needs an Internet connection. This solution provides an integrated set of Internet tools along with related materials to address educators' specific needs. Available with a Power Macintosh 5200/75 LC or a Macintosh LC 580 or as a stand-alone product, the solution includes:

- A modem for dial-up connection
- Netscape Navigator software
- Eudora by Qualcomm, e-mail software
- InterCon's InterSLIP dial-up connection software
- A discount connection offering through a national service provider
- A step-by-step guide describing how to set up the equipment, install the software, and connect to the Internet
- Four of the best-known reference CDs:
 - Earth Explorer from Apple
 - Electronic Arts 3D Atlas from Electronic Arts
 - Grolier Multimedia Encyclopedia from Mindscape
 - Time Almanac: Reference Edition from Compact Publishing

Apple Internet Server Solution for the World Wide Web

This WWW "server in a box" is an all-in-one solution that consists of a Workgroup Server 6150/66, 8150/110, 9150/120, 7250/120 or 8550/132, and a CD-ROM that contains the software needed to get established on the Web. The Apple Internet Server Solution is a multi-platform solution, enabling access by Mac OS, Windows, and UNIX clients on the WWW. This software includes:

- WebSTAR from StarNine allows a Workgroup Server to serve information on the WWW.
- Adobe PageMill, makes creating web pages an easy, graphical process.

- MacDNS from Apple maps an IP address to a recognizable web server name which enables web clients to find your server.
- NetCloak from Maxum Development, provides additional capabilities to HTML standards.
- ServerStat from Kitchen Sink Software, helps you manage your server efficiently by analyzing WebSTAR traffic reports.
- RealAudio Server from Progressive Networks lets you enhance your web pages with high-quality sound.
- HyperCard from Apple a popular software erector set that is easily customized to perform a variety of tasks, such as serving as a multimedia database, and includes HyperCard Common Gateway Interfaces (CGI).
- FileMaker from Claris* an easy-to-use, yet powerful flat-file database and includes FileMaker Pro CGI.
- EveryWare Tango and Butler SQL* a web database solutions which includes solutions for on-line conferencing, catalogs, registration, and classified ads.
- Netscape Navigator client lets you preview your web pages before you post them.
- BBEdit from Bare Bones Software a high-performance text editor for advanced HTML coding.
- Adobe Acrobat Pro creates and translates documents into portable document format (PDF), the cross-platform Internet document standard.
- Image Map software creates hotspots in GIF or PICT graphics to incorporate into web pages, and includes a CGI to serve the image map.
- Electronic Mail CGI gives e-mail capability to web browsers that do not have it.
- Sample web pages offer templates of web pages that you can easily customize to suit your needs, including home pages, a catalog page, and forms.
- AppleScript lets you take advantage of the power of scripting without requiring a knowledge of C programming.
- AppleSearch 1.5 enables you to index documents on local servers or in a database and search them by key words, includes AppleSearch CGI.

* Does not include complete application package.

QuickTime Products

QuickTime, Apple's interactive multimedia technology, has become the multimedia content delivery standard for the Internet. It is a system software extension that provides an interface for editing video, animation, music, text, and other time-based information. Because it is a cross-platform technology, QuickTime is ideal for Internet content delivery and creation. Publishers can use QuickTime to create compelling Internet content by using existing material and adding interactivity to produce new experiences. In addition, QuickTime makes electronic commerce more viable for consumers by letting them "pick up" items and examine them from all angles. QuickTime product extensions include:

- QuickTime Music Tool Kit, which allows users to interact with music just like they interact with graphics and text.
- QuickTime VR, which creates virtual- reality experiences by piecing together photos from a standard 35mm camera to produce panoramic views.

- QuickTime Conferencing, which allows users with a video camera to set up a multiparty conference over the Internet in real time.

AppleSearch

AppleSearch is easy-to-use yet sophisticated client/server software designed to be a knowledge navigator that finds information relevant to users' needs. Internet publishers can use AppleSearch to index volumes of text, images, or video on their WWW servers, so users can easily search for information. LAN managers can use AppleSearch to manage and use the growing stockpiles of electronic information by letting users on a network search for data stored on local servers as well as on the vast resources of the Internet -- from both Macintosh com-puters and PCs running Windows. AppleSearch:

- Allows search requests to be entered in the user's own words and provides immediate search results.
- Supports many clients through a single Internet connection to the server.
- Lets LAN managers choose WAIS servers that are useful to the workgroup.

Apple Remote Access Products

Apple Remote Access software is the dial-up solution favored by organizations that want to extend their Internet connection to remote or traveling users. Apple Remote Acces servers, used with Apple IP Gateway software, make it easy to connect authorized Macintosh or PowerBook computer users at a remote location to the Internet, as well as provide access to local information and resources. Apple Remote Access solutions are ideal for workgroups or entire organizations that want to enable employees to work productively and efficiently from any location -- whether they're at home, out of town, or even out of the country. Apple Remote Access:

- Offers the easiest-to-configure dial-up solution for the Internet.
- Allows MacTCP to work without additional software -- the same way it works on a Local Area network.

Apple Internet Router

Apple Internet Router software offers both local and wide area, AppleTalk protocol only, networking flexibility. Two or more local workgroups can be connected over industry standard network types, including LocalTalk, Ethernet, and Token Ring. If an Internet connection is already in place on a network with a DDP/IP gateway (like the Apple IP Gateway), Apple Internet Router software can provide Internet access for users on LocalTalk networks. And, as the network grows larger and more global, the Apple Internet Router lets users choose among several wide area options. They can link remote sites to the network through a dial-up connection over a standard modem, or they can add one of the Apple Internet Router Wide Area Extensions (available separately) to link AppleTalk networks using X.25 or TCP/IP -- the protocol of the Internet.

NOTE: Apple Internet Router software requires it being run on a computer using classic networking.

Apple IP Gateway

With the Apple IP Gateway, Macintosh users with Apple Remote Access, LocalTalk, or any other AppleTalk network connection can connect easily to an Ethernet-based TCP/IP network to use the full range of Internet Protocol (IP) services. These include the vast array of Internet services such as Telnet, File Transfer Protocol (FTP), Gopher, World Wide Web, and Wide Area Information Servers (WAIS). An Internet connection is required. The Apple IP Gateway:

- Allows a single MacTCP configuration for all IP users on the LAN, eliminating the need for individual IP addresses.
- Lets mobile, remote, and local AppleTalk network users access the Internet -- even if the users' AppleTalk network does not directly support IP services.
- In conjunction with Apple Internet Router software, provides IP access to any Macintosh computer that is part of the router's network.
- In conjunction with an Apple Remote Access server, provides IP access to remote or mobile users.

AppleShare 4.2: Product Description (10/95)

=====

Article Created: 25 September 1995
Article Reviewed/Updated: 13 October 1995

TOPIC -----

This article describes AppleShare 4.2.

DISCUSSION -----

AppleShare is high performance, easy-to-use file and print sharing software that allows networked Macintosh and Microsoft Windows software-based computers to share files, applications, and printers.

With AppleShare file server software, organizations can store all of their shared files and applications in a single, central location, providing convenient, easy access to every user on the local area network. By allowing networked users to centralize all key files and applications for easy sharing, AppleShare improves everyone's productivity. It eliminates time spent looking for files, worrying about misplaced documents, and determining the file or application version.

AppleShare print server software offers all users queued access to up to five networked printers. This time saving function allows users to be more productive because they can use their computers to tackle other tasks instead of waiting for documents to print.

Now, all networked users can connect easily to an AppleShare server. AppleShare lets Macintosh users access shared resources via the Mac OS, and Windows software-based computers users via the Windows interface. AppleShare's network architecture coexists with other application programs and networking services such as Novell NetWare, Windows for Workgroups, and even the Internet.

Yet for all of its power and capabilities, AppleShare is extremely easy to set up, use, and maintain. It continues in the "plug and play" tradition established by the Macintosh more than a decade ago; most system administrators find that they can get an AppleShare server up and running within 15 minutes. And overall

maintenance -- including the addition and deletion of users -- is so simple that a dedicated, full-time administrator is not required. In fact, because AppleShare is so easy to install, maintain, reconfigure, and expand, it offers the lowest long-term cost of ownership of any product in its class.*

Whether your organization is a small or medium-size business, a classroom, or a department within a global enterprise, AppleShare improves collaboration and increases efficiency for all users.

*Based on a report by Business Research Group, Newton, Massachusetts

Features

Powerful file and print services

- Lets users store their files and applications in a single, central location
- Makes it easy and efficient to print documents to networked printers
- Provides comprehensive, easy-to-implement security

Ease of use

- Installs with a single click of the mouse
- Can be up and running in minutes
- Makes day-to-day management quick and easy
- Users can take advantage of file and print services from either Macintosh computers or Windows software-based PCs

Compatibility

- Includes full support for both Macintosh and Windows clients
- Server works with all Mac OS-compatible applications

Performance and scalability

- Supports up to 250 users
- Performs up to 10 times faster than built-in Mac OS file sharing
- Can be configured for use in an AppleTalk network of any size
- Is scalable from LocalTalk to Ethernet networks, and beyond
- Offers highest performance when running on PowerPC-based Workgroup Servers

TOPIC -----

This article provides the product details and order information for AppleShare 4.2.

DISCUSSION -----

Product Details
=====

Capabilities and services

- Includes file and print servers
- Supports Mac OS program linking and publish and subscribe
- Features an open environment that allows additional network services
- Macintosh client software built into every Macintosh; Windows client software sold separately

Sharing options

- On-line CD-ROM exchange
- Sharing of folders or entire disks
- Easy server selection through the Chooser
- Intuitive, consistent access to shared resources
- User-controlled access to information

Print spooling

- Provides spooling for up to five networked printers
- Offers centralized queue management
- Accepts simultaneous print requests
- Frees client workstations for use immediately
- Includes print log for up to 1,000 print jobs

Administrator control

- Administrator can set number of connected users

- Server messages can be broadcast or sent to selected users
- Administrator can set cache sizes to maximize performance

Security

- Minimum password length
- Password aging
- Password history to prevent immediate reuse
- Ability to disallow saved passwords
- Account disabled after specified number of password failures
- Adjustable time limit for temporary accounts
- Guest access allowed; turned off by default
- Copy-protection setting for documents
- "Lock" setting for folders
- Adjustable number of concurrent application launches
- Inherited folder privileges
- Administrator log-off of any user

Network requirements

- An AppleTalk network connection (via LocalTalk, Ethernet, Token Ring, or Apple Remote Access software):

AppleShare Product Family

=====

AppleShare software comes in three versions that are designed to accommodate a variety of workgroup sizes and performance needs.

AppleShare 3.0.1 is designed for smaller work-groups of Macintosh and Windows software-based computers that have outgrown the basic file-sharing capabilities of the Mac OS. It runs on 68030-based, or earlier, Macintosh computers.

AppleShare 4.0.2 offers significant performance improvements over AppleShare 3.0.1, and runs on 68040-based Macintosh computers. Like AppleShare 3.0.1, it's appropriate for smaller, cross-platform workgroups that want to move beyond simple Mac OS file sharing and is extremely easy to set up and administer.

AppleShare 4.2 is the highest-performance AppleShare version available. Optimized for Apple PowerPC processor-based Workgroup Servers, it offers higher performance and supports more users than previous versions, yet retains the ease of use shared by the other product offerings in the AppleShare family.

Begin_Table

Specifications	3.0.1	4.0.2	4.1	4.2	Pro 1.1

Supported platforms

AppleShare Server

- AppleShare 3.0.1: 68030-based (or earlier) Macintosh computers
- AppleShare 4.0.2: 68040-based Macintosh computers*
- AppleShare 4.2: NuBus PowerPC processor-based Workgroup Servers**

AppleShare Client

Macintosh

- An Apple Macintosh computer with an internal hard disk drive and at least 4MB of RAM
- Mac OS software version 6.0.7 or later
- System 7.5.1 required for optimal performance of AppleShare 4.2

Windows

- Any IBM or 100 percent compatible computer running Intel processor 386 or greater; ISA, MicroChannel, VISA, and EISA internal buses; 4MB of RAM
- Windows 3.1, 3.11, or Windows for Workgroups 3.11 software
- MS-DOS 5.0 or later
- Ethernet network adapter card
- NDIS 3.0 or ODI network interface driver

* AppleShare 4.0.2 is not designed to run on the Macintosh Quadra 660AV and Macintosh Quadra 840AV computers.

** AppleShare 4.2 is not designed to run on PCI-Bus Power Macintosh computers.

Ordering and Licensing Information

Workgroup Server 9150/120: CD-ROM Setup 5.0.3 Issue (10/95)

Revised: 10/4/95
Security: Everyone

Workgroup Server 9150/120: CD-ROM Setup 5.0.3 Issue (10/95)

=====

Article Created: 4 October 1995

TOPIC -----

This article describes an issue with the Workgroup Server 9150/120 and CD-ROM Setup 5.0.3 found on the Workgroup Server 7.5.1 startup CD.

DISCUSSION -----

If you have either Apple RAID striped, or mirrored volumes on a Workgroup Server 9150/120 with an internal Panasonic (also known as MKE) CD-ROM drive, the server may freeze during startup from a bootable CD-ROM disc. This may happen even if you have installed Macintosh CD-ROM Setup 5.1.1 or later on a Workgroup Server 9150/120 and then try to startup from the startup CD disc that came with your server.

This is because the older CD-ROM driver, version 5.0.3, will be loaded from the startup CD disc, which may cause the server to freeze. Typically, if a Workgroup Server freezes during startup from the startup CD, a hardware problem might be suspected since the startup CD is considered a "clean" system. However, with the older CD-ROM drivers on the CD, a startup floppy disk should be made to let you startup the server in emergencies. A startup floppy disk can be made by following the following steps:

Step 1

Creating a disk tools floppy from the image on the Workgroup Server 7.5.1 CD.

Step 2

Throw the CD-ROM Setup 5.0.3 extension from the Extensions folder in the System Folder on the Disk Tools disk created in step 1 in the trash, and select the Empty Trash command in the Special menu.

Step 3

Drag the CD-ROM Setup 5.1.1 extension to Disk Tools floppy disk's Extensions folder in the System Folder.

Step 4

Keep this Disk Tools floppy for emergencies to startup the Workgroup Server 9150/120.

MacX 1.5: Technical Specifications (1/97)

=====

Article Created: 21 September 1995
Article Reviewed/Updated: 17 January 1997

TOPIC -----

This article provides the product technical specifications and ordering information for MacX 1.5.

DISCUSSION -----

Technical Specifications

X Window features supported

- Full X11R5 specification
- Color and gray-scale X applications
- Font server through the X logical font description (XLFD) protocol
- xdm and xdmcp logins
- rsh and rexec logins
- ICCCM window management
- Rooted or rootless windows
- Automated host login and client startup

Supported network packages

- Apple TCP/IP Connection for Macintosh
- DEC PATHWORKS for Macintosh
- InterCon TCP/Connect II
- Novell LAN Workplace for Macintosh
- Wollongong PathWay Access

System requirements

- Apple Macintosh, Power Macintosh, PowerBook, or other Mac OS based computer
- 68030, 68040, or PowerPC processor
- Macintosh system software version 7.1 or later
- At least 5MB of RAM for 680x0-based computers (8MB recommended), and 8MB for PowerPC processor-based computers (16MB recommended)

..TIL18627-MacX_1-5-Technical_Specifications_1-97.pdf

- Local or network access to a CD-ROM drive
- Access to a UNIX or VMS host via one of the following connections:
 - Direct Ethernet or Token Ring
 - LocalTalk bridged to Ethernet
 - Remote access via PPP, SLIP, or ARA

Ordering Information

MacX 1.5

Order No. M0108Z/E

- CD-ROM containing MacX for both 680x0-based and PowerPC processor based Macintosh systems and MacTCP, Apple DocViewer, SimpleText, and DiskCopy software
- MacX Getting Started guide

MacX 1.5 20-User Kit

Order No. M3780Z/A

MacX 1.5 Volume License Kit

In the U.S., order No. M4462LL/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Security: Everyone

PowerShare 1.1: Product Description (9/95)

=====

Article Created: 21 September 1995

TOPIC -----

This article describes the Apple PowerShare 1.1 Collaboration Server.

DISCUSSION -----

PowerShare Collaboration Servers software from Apple provides easy-to-use e-mail, catalog, and privacy services for AppleTalk networks. It extends the capabilities of Apple's PowerTalk software to workgroups, enhancing the reliability, security, and manageability of collaborative communications.

PowerShare permits centralized administration of PowerTalk collaboration services and shifts some PowerTalk functions from individual client work-stations to powerful workgroup servers.

PowerShare Mail servers capture incoming mail even when the recipient's computer is not available. Users can retrieve their messages when they're working at a different computer; with Apple Remote Access software, they can dial in from anywhere. PowerShare administrators can import data from tab-delimited text files, including Internet addresses. There's also utility software for transferring e-mail and user account information from a Microsoft Mail for AppleTalk Networks server to a PowerShare server.

Optional server-based gateway software provides easy-to-manage, centralized communications, allowing all connected PowerTalk users to receive fax messages, Internet e-mail, and messages from other sources in their "universal mailbox."

PowerShare Catalog servers hold departmental and company-wide directories (including Internet addresses) for access by any PowerTalk user. Instead of each user having to maintain a separate personal catalog, a single administrator can ensure that everyone has up-to-date information. Shared catalogs can be replicated on multiple PowerShare servers to provide fast access from anywhere on the network.

PowerShare automatically encrypts data passing through its servers. It also authenticates users to make certain that sensitive information is seen only by those for whom it is intended.

PowerShare comes with Easy Setup software, which lets the network administrator configure mail and catalog servers in minutes. The administrator can then use the PowerShare Admin program from any Macintosh computer on the network to create user accounts and perform other management tasks.

Features

Server-based mail

- Enables users to retrieve their mail from any connected Mac OS-based computer (including dial-in connections using Apple Remote Access software)
- Supports centralized, easy-to-manage gateways that let PowerTalk users exchange mail with remote messaging systems
- Permits users of shared workstations to keep private mailboxes on the server
- Saves disk space on individual computers

Shared catalogs

- Makes vital information instantly accessible to everyone who needs it
- Permits centralized administration of shared information
- Lets administrators import text files containing Internet addresses

Enhanced network security

- Encrypts communications to protect confidentiality
- Authenticates users to ensure that sensitive information is seen only by the intended recipients

Easy installation and management

- Includes the Easy Setup utility to configure servers within minutes
- Allows an administrator to manage all PowerShare servers from any Mac OS-based computer on the network

PowerShare 1.1 Collaboration Servers Tech Specifications (9/95)

=====

Article Created: 21 September 1995

TOPIC -----

This article provides the technical specifications and order information for PowerShare 1.1 Collaborative Servers software.

DISCUSSION -----

Technical Specifications

New features in PowerShare 1.1

- Improved server routing performance that gets messages to their destinations up to three times faster
- Ability to import tab delimited text files containing data such as Internet addresses and telephone listings
- Ability to store Internet addresses in a PowerShare catalog and manage them from within the PowerShare Admin application
- Apple Migration Tool for Microsoft Mail, for transferring e-mail and user account information from a Microsoft Mail for AppleTalk Networks server to a PowerShare server

PowerShare Mail server

- Provides server-based messaging services for PowerTalk users
- Stores PowerTalk messages to ensure delivery when user systems come online
- Saves disk space on client workstations

PowerShare Catalog server

- Stores collaborative information—such as group addresses, document templates, graphics, and sounds—in shared catalogs
- Authenticates users and encrypts their network traffic (including e-mail)
- Supports distributed systems of multiple servers
- Replicates and synchronizes catalogs across multiple servers for higher performance and greater reliability
- Enables multiple collaborative applications to share a single catalog

PowerShare Admin utility

- Lets administrators create user accounts and define groups
- Monitors mail and catalog servers to detect problems
- Provides system alerts to administrators
- Permits server management from any Macintosh system on the network

Easy Setup utility

- Lets administrators quickly configure a simple PowerShare system

System requirements

- One of the following systems:
 - An Apple Macintosh computer with a 68020 or later processor
 - A Power Macintosh computer
 - Any other similarly equipped Mac OS-based computer
- At least 8MB of RAM
- Macintosh System 7.5 or later with PowerTalk* installed
- A hard disk drive
- An AppleTalk connection
- Client computers: Macintosh, PowerBook, Power Macintosh, and/or other Mac OS-based client computers running Macintosh System 7.5 or later with PowerTalk* installed and an AppleTalk connection (direct or via Apple Remote Access software)

* The PowerTalk software included in Macintosh System 7.5 provides a single universal mailbox for all incoming messages from many sources, supports the use of collaborative applications to work together over a network, and lets users set up catalogs (directories) of personal information.

Ordering Information

PowerShare Collaboration Servers

Order No. M1907Z/D

- PowerShare version 1.1 server software, including PowerShare Mail server, Catalog server, Admin, and Easy Setup software
- Apple Migration Tool for Microsoft Mail, for transferring information from a Microsoft Mail for AppleTalk Networks server to a PowerShare server
- PowerShare System Administrator's Guide
- PowerTalk and PowerShare Solutions Guide

Macintosh 580 & 630: Disk Tools Disk Won't Mount CDs (10/95)

Revised: 10/16/95
Security: Everyone

Macintosh 580 & 630: Disk Tools Disk Won't Mount CDs (10/95)

=====

Article Created: 16 October 1995

TOPIC -----

I made a Disk Tools disk from the Disk Images folder on the Apple Macintosh CD that came with my Macintosh Performa 630 or 580 computer. When I started up the Macintosh with that Disk Tools disk, I could not recognize the CD-ROM drive.

DISCUSSION -----

The Disk Tools disk image included with these computers is not intended to be a fully functional system, it is an emergency boot volume to perform hard disk repair. The System Folder on the Disk Tools disk you created is missing the resources to mount a CD-ROM disc.

The recommended alternative is to startup from the Apple Macintosh or Performa CD by holding down the Option-Command-Shift-Delete keys, as detailed in the TIL article "Macintosh: Starting from Floppy or CD-ROM disc".

Plaintalk 1.4.1: PostScript Error When Printing Read Me (10/95)

Revised: 10/9/95
Security: Everyone

Plaintalk 1.4.1: PostScript Error When Printing Read Me (10/95)

=====

Article Created: 20 September 1995
Article Reviewed/Updated: 9 October 1995

TOPIC -----

I am unable to print the "Using Speech Recognition" ReadMe file included with the Plaintalk 1.4.1 software I downloaded. I have tried several different versions of the LaserWriter driver and different computers but I get a Postscript error in each case.

DISCUSSION -----

There was a problem with one of the graphics imbedded in the "Using Speech Recognition" ReadMe file that was posted to online services from August 17, 1995 through October 5, 1995. A corrected ReadMe File was posted October 5, 1995.

If you are unable to download the new corrected ReadMe file, you can open the old document with a word processing program other than SimpleText and it will print fine.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
09 Oct 1995 - Added information on the corrected file.

RAM Doubler: Still Loads Even When Shift Key Held Down (9/95)

Revised: 9/21/95
Security: Everyone

RAM Doubler: Still Loads Even When Shift Key Held Down (9/95)

=====

Article Created: 21 September 1995

TOPIC -----

When I start my computer with the Shift key held down, RAM Doubler still loads.
Is my keyboard defective?

DISCUSSION -----

No, even with with extensions off, RAM Doubler will load. To temporarily disable RAM Doubler, during startup hold down the Tilde (~) key located to the left of the !/1 key on your keyboard. If you have System 7.5.x, during startup, you can hold down the space bar on your keyboard until the Extensions Manager opens and uncheck RAM Doubler to disable the product.

If conventional attempts to disable RAM Doubler fail, contact the makers of RAM Doubler, Connectix, for compatibility and configuration assistance with their product.

If you are troubleshooting a system software or extensions issue, you may wish to perform a clean install or clean restore of your system software. Use the search string "clean install" to locate the specific TIL article on a clean install or clean restore for your computer.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Connectix's address and phone number.

Energy Saver Control Panel: Sleep and Power Management (5/96)

Revised: 5/17/96
Security: Everyone

Energy Saver Control Panel: Sleep and Power Management (5/96)

=====

Article Created: 22 September 1995
Article Reviewed/Updated: 16 May 1996

TOPIC -----

This article provides details about the "Sleep" and power management functions of the Energy Saver control panel shipping with the Power Macintosh 7200, 7500, and 8500 series computers.

Questions answered in this article:

- 1) Is the central processing unit (CPU) still responsive when the Energy Saver control panel spins down the hard drive in sleep mode?
- 2) Is it possible to spin down the hard drive, but not put the monitor into sleep mode?
- 3) Can the Energy Saver control panel spin down any hard drive attached to the SCSI bus, or only the startup disk?
- 4) When does the Energy Saver control panel begin the countdown before putting the computer to sleep or shutting down? Is there a specified delay, or does the countdown begin as soon as the computer is idle?
- 5) If my computer is in sleep mode, and a fax call comes in (assuming the fax software is set to receive faxes), does my computer wake up and receive the fax?

DISCUSSION -----

1) Question: Is the central processing unit (CPU) still responsive when the Energy Saver control panel spins down the hard drive in sleep mode?

Answer: While in sleep mode, the CPU responds to mouse, keyboard, and serial port activity. If an activity requires disk access, the hard drive is spun up.

2) Question: Is it possible to spin down the hard drive, but not put the monitor into sleep mode?

Answer: Yes, it is possible for the hard drive to spin down even though the monitor is not in sleep mode. When the hard drive is spun down, the arrow is unresponsive (as if the system is frozen), but hitting a key spins the hard drive back up. However, there is a delay before the drive spins back up, and there is no notification to the user that the drive is spinning back up.

3) Question: Can the Energy Saver control panel spin down any hard drive attached to the SCSI bus, or only the startup disk?

Answer: The Energy Saver control panel may or may not spin down all hard drives attached to the SCSI bus. Apple has not tested The ability to spin down a hard drive is dependent on the formatting software used on the hard drive. In limited testing, the Energy Saver control panel has spun down external drives formatted with Drive Setup.

4) Question: When does the Energy Saver control panel begin the countdown before putting the computer to sleep or shutting down? Is there a specified delay, or does the countdown begin as soon as the computer is idle?

Answer: The countdown to shutdown or sleep begins as soon as the computer is idle. Your computer is idle if when all of the following conditions are met:

- No Apple Desktop Bus (ADB) routines other than routine monitoring of the bus
- No Input/Output (I/O) calls to firmware (Read, Write, Control, Format, Status)
- No changes in the cursor (for example, the rotation of a hand in the clock icon)
- No post-event calls (for example, a call resulting from insertion of a disk)
- No communication through the serial port

5) Question: If my computer is in sleep mode, and a fax call comes in (assuming the fax software is set to receive faxes), does my computer wake up and receive the fax?

Answer: A modem that uses the serial port's 'wake on ring' pin setting, and that has software that reads it, can wake the CPU from sleep. The GeoPort Telecom Adapter from Apple features this capability. Depending on background activity, some fax software may keep the CPU busy and not allow the computer to enter "sleep" mode.

Article Change History:

16 May 1996 - Revised modem information.

08 Jan 1996 - Changed distribution status.

Macintosh Client Unrecognized Login Sequence to NetWare (10/95)

Revised: 10/17/95
Security: Everyone

Macintosh Client Unrecognized Login Sequence to NetWare (10/95)

Article Created: 25 September 1995
Article Reviewed/Updated: 17 October 1995

TOPIC -----

I just installed a NetWare 4.1 server on my network, but now my Macintosh clients receive this message, "This File server is not using a recognizable logon sequence," when trying to access the 4.1 server. My existing Novell servers did not cause this message. What can I do to resolve this?

DISCUSSION -----

First, the situation you describe is not an Apple Computer issue. For support with NetWare servers, you should either contact your network and/or NetWare administrator(s), or Novell support directly.

In summary, Novell has alternate methods of user login authentication which are not inherent to AppleShare. The error message you describe indicates that this server is employing an alternate authentication scheme. From information we have, this appears to be a NetWare 4.1 issue only. The error message will occur when you do not have the Novell Macintosh client software (Netware.UAM) installed which came with NetWare 4.1, and/or you have the default Macintosh security options set.

Here are two procedures to check which may resolve your issue. These are both Novell server and administration procedures that should be done by the support person who is responsible for the Novell server(s).

Install Novell Macintosh Client Software

The path to the Macintosh client software is /PUBLIC/Mac/English on the Novell 4.1 server SYS volume. The file you are looking for is MacNDS.sea, and launch this .sea (self-extracting archive) file. Then launch the extracted installer which will add nine items to the Extensions and Control Panels folders.

- Seven are extensions, they are: MacIPX Ethernet, MacIPX AppleTalk, MacIPX

Token Ring, AppleShare (3.5), NetWare Notify, ~NetWare Aliases, and NetWare UAM. Note that NetWare UAM is for the support of Novell's User Authentication Method

- Two are control panels, they are: MacIPX and MacNCP.

Also, please refer to the Novell client documentation which is either online, or in manual form.

Load ATCONFIG.NLM

From the Novell 4.1 file server load ATCONFIG.NLM by selecting the following menu options:

Configure File Services
 Detailed Configuration
 User Access Information

Under User Access Information the first option should read:

Allow Clear Text Passwords Login YES

The default setting for Allow Clear Text Passwords Login is NO. Setting this option to YES will let Macintosh clients login without Novell's Macintosh client software being installed. This procedure is less secure because this option does not necessitate encrypted passwords on the network's physical media, and a packet analyzer can read the passwords.

Open Transport, Eudora, and PPP Connection Issue (10/96)

Revised: 10/24/96
Security: Everyone

Open Transport, Eudora, and PPP Connection Issue (10/96)

=====

Article Created: 25 September 1995
Article Reviewed/Updated: 24 October 1996

TOPIC -----

I have a Power Macintosh 7500 with Open Transport 1.0.7, MacPPP 2.1.1SD. I've gotten Netscape and Fetch to work. With Eudora, however, I have a problem of not being able to send mail. I can receive mail, but when attempting to send I get the dialog, "Euroda said 'data:' and server said "", with a sorry button.

I have tried three different versions of Eudora -- 1.5.1, 1.5.3, and 2.1.3 (Eudora Pro). I get the same errors with all of them. I have also called Eudora technical support, and received conflicting information, although the more senior person told me there were problems with 2.1.3.

My question is, does Eudora work with Open Transport? Your Read Me file indicates at least that Eudora 1.5.1 should work.

DISCUSSION -----

This issue has been taken care of with Open Transport 1.0.8 and later, so you should upgrade your version of Open Transport. Version 1.1 is part of System 7.5 Update 2.0, which is available from the online services where Apple posts software updates. Also, Qualcomm currently recommends using Eudora versions 1.5.3, 1.5.4, 2.1.3, 2.1.4 (or newer) with Open Transport.

If you do not have access to Open Transport 1.0.8 or later the workaround below may work.

Eudora 1.5.1 does work properly with Open Transport unless you are using a SLIP or PPP connection. In this case, Eudora has a issue sending small mail messages.

The workaround at this point is to make sure the mail message contains at least 1500 characters. This seems to allow the message to be sent every time. This workaround has not received extensive testing and is not guaranteed to work. In

fact, 1500 characters may be a bit of overkill but it seems to be reliable.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:

24 Oct 1996 - Updated Eudora information.
09 Jul 1996 - Added information on Open Transport 1.1.
02 Jul 1996 - Added Fax Doc word

Cascading the Ethernet 10T/5 Workgroup Hub (9/95)

Revised: 9/25/95
Security: Everyone

Cascading the Ethernet 10T/5 Workgroup Hub (9/95)

=====

Article Created: 25 September 1995

TOPIC -----

This article describes cascading the Ethernet 10T/5 Workgroup Hub.

DISCUSSION -----

For proper operation when cascading the Ethernet 10T/5 Workgroup Hub, a port on the Workgroup Hub should be:

- Connected to the uplink port of the parent hub.
- Connected to a regular port using either a 10-baseT crossover cable, or with two 10-baseT cables joined with the Apple Expansion adapter (included with the hub).

NOTE: The cascade limits for 10-baseT demand that no packet on the network travel through more than four hubs or repeating devices. This specification must NOT be exceeded.

Global Village PowerPort Gold: PPP Initialization String (9/95)

Revised: 4/21/97
Security: Everyone

Global Village PowerPort Gold: PPP Initialization String (9/95)

=====

Article Created: 26 September 1995

TOPIC -----

What initialization string should I enter for PPP access using a Global Village PowerPort Gold modem which came with my Performa?

DISCUSSION -----

The recommended initialization string for dialing into UNIX-based PPP servers would be:

AT&F1%C0\NO (NOTE: Use zeroes, not the letter "o")

This command string resets the modem to factory defaults and turns off hardware compression and error correction.

For other PPP servers, use the initialization string:

AT&F1

This command string resets the modem to factory defaults.

What Is MacIPX and How To Obtain It (9/95)

Revised: 9/26/95
Security: Everyone

What Is MacIPX and How To Obtain It (9/95)

=====

Article Created: 26 September 1995

TOPIC -----

What is MacIPX and how do I get it?

DISCUSSION -----

MacIPX is a control panel that lets a Macintosh computer use IPX (internet packet exchange) services, a Novell defined protocol. MacIPX is not an Apple product, it is a Novell product. If a user needs support or upgrade information for MacIPX, they need to contact the vendor from whom they received MacIPX. For example, Claris has licensed MacIPX from Novell for use with some of its FileMaker database products; because Claris ships MacIPX then a user should contact Claris for MacIPX support related to FileMaker. Another example might be if a user gets MacIPX from Novell as part of NetWare file services, then they should contact Novell for support.

AppleVision Software: Not Supported With Non-AV Monitors (9/95)

Revised: 9/26/95
Security: Everyone

AppleVision Software: Not Supported With Non-AV Monitors (9/95)

=====

Article Created: 22 September 1995

TOPIC -----

I recently installed the AppleVision software on my Macintosh. I wanted to get a version of the Control Strip that works on my Macintosh and take advantage of the Monitor BitDepth and Monitor Resolution Control Strip modules included with the AppleVision software. Although I do not have an AppleVision Monitor, the AppleVision software and Control Strip functions worked fine on my computer initially. However, when I restarted the computer recently, it froze when the "Display Enabler" extension appeared on the screen.

DISCUSSION -----

The AppleVision software is only intended for use with Macintosh and Power Macintosh computers that have an AppleVision or AudioVision Display connected. Even though it may work, the AppleVision software checks for display type through the ADB bus and therefore is not supported on Macintosh and Power Macintosh computers that have other displays.

Desktop Printing Software v1.0.3: Read Me File (9/95)

Revised: 9/26/95
Security: Everyone

Desktop Printing Software v1.0.3: Read Me File (9/95)

=====

Article Created: 26 September 1995

TOPIC -----

This article contains the ReadMe file included with the Desktop Printing software version 1.0.3.

DISCUSSION -----

Information About Desktop Printing Software version 1.0.3

Desktop Printing Software v1.0.3 fixes memory related problems that occur on Power Macintosh computers that have Open Transport installed. If you have a Power Macintosh 9500, 8500, 7500, or 7200, you may have experienced system errors while printing to a desktop printer. This is especially likely if you have turned off Virtual Memory.

Desktop Printing Software v1.0.3 includes support for the Extensions Manager. All three components of the Desktop Printing Software now appear in the Extensions Manager control panel. These components include the Desktop Printer Extension, Desktop PrintMonitor, and Desktop Printer Spooler.

Upgrading to Desktop Printing Software v1.0.3

This version of Desktop Printing Software is intended only for Macintosh users who need to upgrade from an earlier version of Desktop Printing Software. Desktop Printing Software v1.0.3 may not function correctly on Macintosh computers that do not already have an earlier version of Desktop Printing Software installed.

An installer application is not available for this upgrade. To install this upgrade, you must follow these steps:

Step 1

Restart your Macintosh with the Shift key held down. This will temporarily disable your system extensions.

Step 2

Select the desktop printer icons located on your desktop and drag them to the Trash.

Step 3

Drag the three components of the Desktop Printing Software v1.0.3 to your System Folder icon. Your Macintosh will display a message asking if you want to place the software components in your Extensions folder. Click "OK". Your Macintosh will then display a message asking if you want to replace the old components of the Desktop Printing Software with the new ones. Click "OK".

Step 4

Restart your Macintosh.

After restarting, a desktop printer icon for the printer you most recently used will automatically be created. To create a desktop printer icon for another printer, select the printer using the Chooser. After you close the Chooser the new desktop printer icon will appear on your desktop.

Disabling the Desktop Printing Software

If you are using System 7.5 or later, you can disable the Desktop Printing Software by un-checking the Desktop Printing Extension, Desktop PrintMonitor, and Desktop Printer Spooler in the Extensions Manager control panel. The Desktop Printing Software will be disabled after you restart your Macintosh.

If you are using an earlier version of the Macintosh System software, you will need to manually drag the Desktop Printing Extension, Desktop PrintMonitor, and Desktop Printer Spooler from your Extensions folder to a location outside of your System Folder. The Desktop Printing Software will be disabled after you restart your Macintosh.

Using More Than Four Desktop Printers

If you are using a Power Macintosh, and want to have more than four desktop printers, you must increase the Desktop PrintMonitor memory allocation by 12K for each additional desktop printer. To do so, select the Desktop PrintMonitor's icon -- it's in the Extensions folder inside the System Folder -- choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

Apple MPEG Media System: Frequently Asked Questions (12/95)

Revised: 2/12/96
Security: Everyone

Apple MPEG Media System: Frequently Asked Questions (12/95)

=====

Article Created: 26 September 1995
Article Reviewed/Updated: 12 December 1995

TOPIC -----

This article contains frequently asked questions (FAQ) about the Apple MPEG Media System and related MPEG terminology.

DISCUSSION -----

Question:
What is MPEG-1?

Answer:
MPEG-1 is an ISO standard developed by the Moving Picture Experts Group for compressing and decompressing video and audio for playback on computers, gameplayers and CD-ROM discs. MPEG-1 is a compression and decompression standard which allows you to play full screen, full motion digital video on your computer.

By definition, MPEG-1 offers the following features:

- Playback from a standard CD-ROM drive
- 74 minutes of video per CD-ROM disc
- Full motion video (30 fps for NTSC; 25 fps for PAL; 24 fps for film playback)
- 24-bit video playback
- 16-bit audio

Question:
Is it really full screen digital video?

Answer:
By definition of MPEG-1, the screen size is 352x240, regardless of the type of computer it is used on. As a result, all computers, including Macintosh and PC compatible, require some sort of pixel doubling/pixel replication in order to

get to 640x480.

Question:

How does this differ from QuickTime?

Answer:

QuickTime provides a mechanism for playing back video sequences at anywhere from 10 to 24 frames per second in a 320x240 window. When viewing the video, it can be choppy and slow. MPEG video played back is smooth flowing full motion.

Question:

What about software based MPEG?

Answer:

Software MPEG, although inexpensive has many limitations. First, software-based MPEG requires at least a 90 MHz Pentium system, which is expensive. Software MPEG playback of non-interactive video titles requires approximately 80% of the computers cycles and does not provide full motion playback. As a result, the computer and user can not perform any tasks in the background while watching a video. More importantly, software MPEG will not have the bandwidth and capability to run interactive titles. Hardware based MPEG solutions on the other hand, require only approximately 20% of the machines cycles. As a result, users can perform tasks on their computer (such as working on a spreadsheet) while simultaneously playing an MPEG movie. In addition, a hardware based MPEG solution is required in order to run any interactive games and interactive education titles.

Question:

What is the Apple MPEG Media System?

Answer:

The Apple MPEG Media System is an MPEG-1 playback (decompression only) card for the Macintosh.

Question:

What computers does this work in?

Answer:

The Apple MPEG Media System works in Macintosh or Power Macintosh computers with an LC-PDS slot and a Video In Slot, such as the Macintosh 630 series of computers, the Power Macintosh 5200 and 6200 series, and the Macintosh LC 580.

The Apple MPEG Media System also requires the Apple Video System or the Apple TV/Video System.

The Apple MPEG Media System does not work in the Macintosh 630 DOS Compatible computer or the Performa 640 DOS Compatible because the MPEG card fits into the LC PDS slot, which is already occupied in the DOS Compatible computers. The Apple MPEG Media System also does not work in Macintosh 630 series computers,

which have a Processor Upgrade Card installed. The Processor Upgrade Card in these computers blocks the PDS slot, which the Apple MPEG Media System requires.

Question:

How much does the Apple MPEG Media System cost?

Answer:

Under \$300, and it includes several MPEG titles.

Question:

Can I play any MPEG titles on my Macintosh?

Answer:

There are a number of different playback standards that have been developed by various companies. Many are proprietary in nature, and as a result have limited playback capability. The different playback standards and their compatibility with the Apple MPEG Media System are as follow:

Digital Videos

This is a Philips proprietary standard. The Apple MPEG Media system can play back all non-interactive Digital Videos.

CDi

CDi and Digital Video are essentially the same. The Apple MPEG Media system can play back all non-interactive CD-i titles.

Video CD-ROM discs

The Apple MPEG Media system can play back all Video CD titles. The interactive Video CD titles simply have a graphical user interface as a front end for selecting and playing the movies on the CD-ROM disc. The Apple MPEG Media System already has a graphical, intuitive user interface to select movies in Apple Video Player.

Interactive titles

The first generations of interactive titles will specify whether they play on Windows or the Mac OS. Interactive titles developed on PC compatible computers will not work on Macintosh computer. However, the Apple MPEG Media System is tightly integrated with QuickTime 2.x. As a result, with QuickTime and QuickTime for Windows a developer could potentially develop a title that would work on both Macintosh and Windows systems.

Apple MPEG Media System: Specifications (3/96)

Revised: 3/4/96
Security: Everyone

Apple MPEG Media System: Specifications (3/96)

Article Created: 26 September 1995
Article Reviewed/Updated: 1 March 1996

TOPIC -----

This article describes the specifications for the Apple MPEG Media System.

DISCUSSION -----

Hardware Features

- Uses PDS slot and DAV connector
- 30 fps playback up to 24 bit*
- Display window up to 640x480 (pixel doubled)
- 16-bit CD quality audio*
- User Installable - No external cabling or power
- NTSC/PAL support

* Note:

The Apple MPEG Media System can playback at these audio rates and video resolutions. However, not all Macintosh computers playback at these rates and resolutions. Check the specifications of your Macintosh computer for information on audio rates and video resolutions.

Software Features

- Apple Video Player 1.3
 - Chapter navigation
 - Capture
 - Re-sizable window
- Supported by QuickTime 2.x

Hardware Specifications

- C-Cubed CL450 MPEG Video Decoder
 - 4 MB DRAM buffer

- NTSC video playback 30 fps
- Film playback 24 fps @ 320x240
- Plays existing MPEG data streams
- 44.1 Khz, 16-bit "CD Quality" audio
- PAL video playback 25 fps
- TI AV 110 MPEG Audio Decoder
 - 1 MB DRAM buffer

Configurations

- M3763LL/A Apple MPEG Starter Kit for Developers
 - Includes MPEG card and beta software
- M3763LL/B Apple MPEG Starter Kit for Developers
 - Same as above with final software
- M4242LL/A Apple MPEG Media System
 - Includes MPEG Card and education specific CD titles
- M4243LL/A Apple MPEG Media System
 - Retail package for consumer, higher-education, and business.
- M4244LL/A MPEG Multipack

Package for developers for creating custom solutions. Includes 10 MPEG cards and one software kit minutes of video to be contained on a single CD-ROM disc.

Hardware Requirements

- Macintosh or Power Macintosh computers with an LC-PDS slot AND a Video In Slot. This includes the Macintosh 630 series of computers, the Power Macintosh 5200 and 6200 series, and the Macintosh LC 580.
- The Apple MPEG Media System also requires the Apple Video System or the Apple TV/Video System.

Note:

The Apple MPEG Media System does not work in the Macintosh 630 DOS Compatible computer or the Performa 640 DOS Compatible because the MPEG card fits into the LC PDS slot, which is already occupied in the DOS Compatible computers. The Apple MPEG Media System also does not work in Macintosh 630 series computers, which have a PowerPC upgrade card installed. The PowerPC Upgrade card in these computers blocks the PDS slot, which the Apple MPEG Media System requires.

Article Change History:

- 01 Mar 1996 - Added note about video resolution and audio rates.
- 12 Dec 1995 - Added hardware requirements section.

QuickTime Conference: Presentations Window Sizes (9/95)

Revised: 9/26/95
Security: Everyone

QuickTime Conference: Presentations Window Sizes (9/95)

=====

Article Created: 26 September 1995

TOPIC -----

What are the window sizes of presentations using QuickTime Conferencing?

DISCUSSION -----

When using QuickTime Conferencing with AppleTalk or TCP/IP on a LAN or WAN, the window sizes are standard QuickTime formats:

- Half size = 80x60
- Normal size = 160x120
- Double size = 320x240

When using QTC with a H.320/ISDN card the window sizes are H.320 formats:

QCIF = 176x144
CIF = 352x288

MAE 2.0: Unable to Format Unformatted Floppies on HP (9/95)

=====

Article Created: 26 September 1995

TOPIC -----

I am not able to format floppies that have never been formatted from within MAE (Macintosh Application Environment) on my HP (Hewlett Packard) workstation. If a floppy has been previously formatted by either DOS, UNIX, or Mac OS, I am then able to format it in MAE.

DISCUSSION -----

To correct the problem, first run 'mediainit' from an hpterm. Once it has been formatted as a UNIX disk, MAE will then be able to format the floppy.

(example: mediainit /dev/rfloppy/c201d0s0)

This issue is being investigated by engineering, however, we do not know when or if this issue will be addressed.

Color StyleWriter 2200: Universal Power Adapter Available (9/95)

=====

Article Created: 26 September 1995

TOPIC -----

I am going to do some international traveling with my Color StyleWriter 220. Will the power adapter that came with my printer work properly in countries outside the United States?

DISCUSSION -----

The Color StyleWriter 2200 ships with a power adapter designed to work in the country where it is sold. The following chart lists the specifications for the power adapters sold in the various regions.

Begin_Table

Country	Voltage	Frequency
=====	=====	=====
USA	120V + 10%/-15%	60 +/-2 Hz
Japan	100V +/- 10%	50 +/-2 Hz
Europe	220V +/-10%	50 +/-2 Hz
Australia	240V +/-10%	50 +/-2 Hz
UK	240V +/-10%	50 +/-2 Hz

End_Table

An optional universal power adapter which handles 100-240 volts at 50-60 Hz is available by ordering the M4133G/A Universal Power Adapter. The universal power adapter has a detachable power cord which provides flexibility because it accepts any standard Macintosh power cord, allowing you to easily adapt to the many different power plug configurations available worldwide.

PlainTalk: :Use PlainTalk Microphone Warning Message (9/95)

Revised: 9/27/95
Security: Everyone

PlainTalk: : "Use PlainTalk Microphone" Warning Message (9/95)

=====

Article Created: 27 September 1995

TOPIC -----

I have successfully installed the PlainTalk speech recognition software on my Macintosh Performa 5200CD series computer. At startup I am getting a message that warns me that voice recognition may not work well because I am using the built-in microphone. The software works fine, but is there any way to avoid this message?

DISCUSSION -----

The only way to avoid getting this error message is to use the PlainTalk microphone. The reason for the message is the internal microphone is susceptible to feedback and noise since it is located nearby and in the same housing as the built-in speakers. The software detects that you have chosen the built-in microphone in the Sound control panel and warns you accordingly.

An option for you is to purchase a PlainTalk microphone and select the external microphone as the input source in the Sound control panel. Open the Sound control panel, select Sound In from the pop-up menu, click Options, and choose the external microphone as your source.

Using the external PlainTalk microphone gives you better speech recognition.

Macintosh CD-ROM: Using as a Jukebox (4/97)

Revised: 4/28/97
Security: Everyone

Macintosh CD-ROM: Using as a Jukebox (4/97)

Article Created: 28 September 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

If your Macintosh computer is equipped with a CD-ROM player, you probably already know about the thousands of CD-ROM titles on the market for conducting research, learning about dinosaurs, or trying new recipes. You have probably also learned to use your Macintosh to play audio compact discs while you work.

DISCUSSION -----

You can take the functionality of your Macintosh as a CD player much further. Along with being able to skip tracks, fast forward or reverse songs, you can set the AppleCD Audio Player to play your whole CD, repeat it continuously, play it in random order, or select and sort only some of the songs to play. This last feature, accessed by pressing the Program button, is very convenient because it lets you omit songs you don't like. And your Macintosh actually "remembers" which tracks not to play the next time you insert the CD. You can also drag and drop songs "on the fly" and rearrange their play order.

AppleCD Audio Player can tell you how long the given track or disc has been playing and how much time is remaining. If you use the program button to rearrange or omit tracks, the time window automatically recalculates to account for the changes you have made. To the right of the CD Title window, the total time for the selections you have chosen displays; this is a handy feature when making recordings from your Macintosh and trying to fit your music on a given length of audio tape.

The AppleCD Audio Player application lets you enter the titles and track list of all your CDs. It is a very simple process. If you need help, in System 7 or later, click on the balloon or "?" menu in the upper right corner of your screen and choose Show Balloons. As you move your mouse over the different areas of the AppleCD Audio Player window, Balloon Help describes each button's function and shows where to enter your CD titles.

Your Macintosh stores all CD specific information in a file called CD Remote Programs in the Preferences Folder of your System Folder. The entry in the CD Remote Programs file is cross-referenced against total time of audio, number of tracks, length of tracks, and various other unique characteristics of individual audio compact discs. This means each Audio CD release has a unique "signature" so if you have two copies of the same CD, the Macintosh recognizes either copy and displays its title and song list if only one of them has already been entered.

Your CD Remote Programs file can also be used on other Macintosh computers. This means you can copy this file to the Preferences Folder of other Macintosh computers and they too would recognize any previously entered CDs. There are other software programs that take this functionality even further.

The freeware program Audio CD Mover by Trygve Isaacson lets you open the CD Remote Programs file and view all your compact discs and their song lists. It also lets you merge your file with files from other computers. This way, you have a greater database of compact discs your Macintosh can recognize and list.

Another piece of freeware software, called CD Coyote by Esa Ristila, not only lets you merge and edit your CD Remote Programs files, but also lets you sort and export your listings for printing a permanent hard copy of your collection. If you get organized with your friends and neighbors in the Macintosh community, you can all share and merge your Audio CD databases and, theoretically, create one huge complete database of all the compact discs on the market! It is really cool to bring home a CD from the store and put it in your computer and have the Macintosh list for you the songs before you have even read the liner notes!

Using your CD-ROM equipped Macintosh, a few software programs, and your friends, you can have a Digital Jukebox that lists, organizes, and plays your favorite songs and even some that you have yet to discover! Do not forget to dress up your AppleCD Audio Player for your next party by personalizing its display colors in the Options menu!

Audio CD Mover and CD Coyote are freeware available on many online services.

AWS 95: A/UX 3.1 and sar -d Not Implemented (9/95)

Revised: 9/29/95
Security: Everyone

AWS 95: A/UX 3.1 and sar -d Not Implemented (9/95)

Article Created: 29 September 1995

TOPIC -----

I have an Apple Workgroup Server (AWS) 95 with A/UX 3.1, and I'm trying to use the sar command with the -d option. However, the -d option does not work and I cannot find it in the man pages.

How do I use "sar -d", or if it's not available how do I monitor disk activity in a similar fashion?

DISCUSSION -----

The -d option, of the sar command, does not appear to have been implemented in A/UX 3.1.x on the AWS 95. Although the -d option did not generate any error messages, it returned nothing. For example, "sar -d 1 10" returned the time stamp every second 10 times.

You can try to use the -b and/or the -w option to monitor the block device buffering and swapping activities. For example,

```
sar -b 1 1000  
sar -w 1 1000
```

These two options are close to monitoring the disk activity you are looking for. For tuned performance, the system reports should be 100% of buffer caches and 0% for swapping activity.

ARA and Open Transport Issue (2/97)

Revised: 4/21/97
Security: Everyone

ARA and Open Transport Issue (2/97)

Article Created: 29 September 1995
Article Reviewed/Updated: 6 February 1997

TOPIC -----

I am using Apple Remote Access (ARA) Personal Server 2.0.1 with a Mac OS computer running an Open Transport version prior to 1.1.1. Each time I connect to the local network (either with LocalTalk, or Ethernet) and make an ARA connection, I lose the local network connection. I can see the remote servers in the Chooser, but not the local servers (AppleShare or Personal File Sharing). If a server is mounted and then an ARA connection is made, the server becomes dimmed.

I'm running Mac OS 7.5.2 with the Open Transport patch 1.0.7.

DISCUSSION -----

This issue has been fixed with Open Transport 1.1.1. If you are not using Open Transport 1.1.1 with ARA, you should update Open Transport. Open Transport 1.1.1 is available on Apple computer's online Software Update locations. Open Transport 1.1.1 is only supported as an update with Open Transport 1.1. Open Transport 1.1.1 is supported on System 7.1.x and System 7.5.3 and later.

NOTE: This issue is independent of whether you are using ARA 2.0.1 or 2.1.

Below is a description of tests which illustrate this Open Transport 1.0.7 and ARA 2.0.1 issue:

Let's say you have zone A and B that are local. The ARA client is in zone A. The ARA server is on a different internetwork in zone C. In addition, let's assume that you can't place the client in zone B via the AppleTalk control panel.

Test 1

If the client is connected to zone A with LocalTalk, then you lose all devices

in both zone A and B. All devices in zone C are available (as well as devices in other remote zones). This confirms what you reported in your escalation.

Test 2

If the client is connected to zone A with Ethernet, then devices in zone A and the remote zone C are available, but devices in zone B are not.

Macintosh Print Pack: Does Not Support HP Printers (9/95)

=====

Article Created: 29 September 1995

TOPIC -----

Is there a compatibility problem between the Hewlett-Packard Deskjet 500 series printers and the Macintosh when using the Macintosh Print Pack?

DISCUSSION -----

The Macintosh Print Pack does not support HP 500 series printers. The only drivers that the Print Pack supports are those that provide full Epson Emulation. The HP printers do not support Epson Emulation. There is a full list of printers supported in the Print Pack documentation.

If you need this functionality for HP products, GDT Softworks, supports some additional drivers including those for HP printers.

The Tech Info Library article titled "Locating Vendor Information" can help you search for GDT Softworks' address and phone number.

SimpleText: Always Downloads Chicago Font (9/95)

Revised: 9/29/95
Security: Everyone

SimpleText: Always Downloads Chicago Font (9/95)

=====

Article Created: 29 September 1995

TOPIC -----

When printing from SimpleText to any LaserWriter, using the LaserWriter 8.x driver, I noticed it downloads Chicago during the printing process. It does not matter what fonts are included in the document, Chicago gets downloaded every time. This occurs on any version of SimpleText or LaserWriter 8 driver I have tried.

DISCUSSION -----

Chicago is the font used internally by the SimpleText for the page numbers at the bottom of each page. If the Chicago font is not already present in the printer's memory, it is downloaded to your printer with each print job.

PlainTalk: Accessing the Speech Tutorial (9/95)

Revised: 9/29/95
Security: Everyone

PlainTalk: Accessing the Speech Tutorial (9/95)

=====

Article Created: 29 September 1995

TOPIC -----

The Speech Tutorial opened once after I installed PlainTalk 1.4.1, but now I cannot figure out how to reopen it.

DISCUSSION -----

The Speech tutorial appears the first time the Speech Control Panel is used to turn Speakable Items on. After the Speech Control Panel is closed, it creates a Speech Preferences file in the Preferences folder. When Speakable Items is turned on, the software looks in the Preferences folder for the existence of a Speech Preferences file, if there is one there, the tutorial is not opened. Therefore, if you do not turn on Speakable Items the first time you open the Control Panel, the tutorial will not appear the next time, even though it is the first time you enable speech recognition.

You can force the Speech Tutorial to launch by following these steps:

Step 1

Make sure Speakable Items is turned off in the Speech Control Panel.

Step 2

Remove the Speech Preferences file from the Preferences folder or drag it to the Trash.

Step 3

Open the Speech Control Panel and click "On" under Speakable Items to launch the Apple Guide tutorial. There are about 10 panels in the Speech tutorial.

If you want the tutorial to be accessed frequently, like in a classroom setting, you can use an AppleScript to open the Speech Guide file at any time. Copy and

..TIL18674-PlainTalk-Accessing_the_Speech_Tutorial_9-95_(TA34501).pdf

paste the following AppleScript into the Script Editor. It can be run directly from the Script Editor or saved as a stand alone application that you can double-click.

```
AGStart -- AGStart scripting addition is required to start Apple Guide
```

```
set ExtFolder to path to extensions folder as text  
copy ExtFolder & "Speech Intro Guide" to GuideFile  
copy ExtFolder & "Apple Guide" to AG
```

```
tell application AG to open alias GuideFile
```

Internet Server Solution: Multiple Default HTML Pages (10/95)

Revised: 10/2/95
Security: Everyone

Internet Server Solution: Multiple Default HTML Pages (10/95)

Article Created: 2 October 1995

TOPIC -----

WebSTAR server and Netscape client software cannot support multiple domain names with multiple default HTML pages on a single IP address. Here is an example to illustrate:

Several Internet Server Solution for the World Wide Web users are acting as Web server providers. They setup the server, manage the internet connection, and publish content for other clients. For ease of use reasons, clients want their URL to contain only an FQDN and not a reference to the path of the HTML file.

For example, consult.com wants to advertise for customer.com. They have created DNS entries for consult.com and customer.com that refer to their server at IP address 1.2.3.4. They want to be able to advertise two URLs that contain only hostname information, individualized for the "site":

```
http://consult.com
http://customer.com
```

Rather than:

```
http://machine.consult.com/consult.HTML
http://machine.consult.com/customer.HTML
```

However, when they try to do this, they always end up on the same default page. They would like different URLs to deliver them to the appropriate home page.

DISCUSSION -----

There are WEB server implementations that allow you to determine which interface a query came from and therefore send you to an specific page for that interface. There are other implementations that allow you to have multiple IP addresses for one single interface. Depending on the address used, the HTTP server will present the client with the appropriate page for the domain requested.

Unfortunately, for the Macintosh servers, the only implementation available, as of October, 1995, is the one presented during WebEdge. This is the only information available right now.

IMPORTANT: Please remember this is NOT a solution supported by Apple Computer. We are providing this information as a service, and Apple Computer does not endorse or recommend any of the products or companies mentioned here.

From The WebEdge II Summary
=====

Multiple Home Pages/One Machine Name

At the conference a "hack" was developed for Webmasters wanting to run multiple "default" home pages from a single machine (for example, advertising agencies wishing to house their client's home pages/sites).

The ideal answer to this problem is to allow multiple IP numbers to be served by a single server. This capability lies in Open Transport's future. Until then, some of this functionality has been addressed by John O'Fallon of Maxum Development Corp. Maxum has in past produced commercial-grade cgi's such as NetCloak, and in fact John's hack requires the use of NetCloak.

For more information on this potential solution, see the Maxum web site at <http://maxum.catalogue.com/NetCloak/HomingHome.HTML> and direct questions to them.

From the Page at, <http://maxum.catalogue.com/NetCloak/HomingHome.HTML>

Serving Multiple Home Pages from Your Mac Server...

In many cases, we've heard of a WebMaster wanting to run several sites off of their Macintosh-based WebSTAR Web server. While it is not a problem to have multiple domains served by a single server (by configuring your DNS with multiple domain names pointing to the same IP address), it is difficult to give each domain its own page based strictly on a URL that is made up of just the domain name.

Presented here is a hack I did at WebEdge II that makes this feature fairly easy to implement using NetCloak 2.0 (currently in development, but publicly available and quite stable). It uses the referrer sent by the browser, along with a redirect (a "meta" tag for Netscape) to determine what domain is currently being requested and redirects the browser to the appropriate page. In a nutshell, here is how it works...

Browser: I'd like your server's home page please...

Server: OK, but you are coming from "Yahoo", and I don't know what that is, so go to the domain parsing page...

Browser: Fine, redirecting to the parsing page...

Server: Ah, now I see that the last page you accessed (the original home page from my site) was "www.foobar.com". If that's what you wanted, let me send you there...

Browser: OK, redirecting to the "foobar" page...

Server: A request for the foobar page. I can deal with that, here you go...

As you can see, the redirect and referrer features of HTTP play a big role, and only browsers that support both will correctly find the page they want. For other browsers, we simply display a list of choices and the user has to pick which home page they wanted.

Also note that Netscape 1.1N does not support the referrer when it is redirecting, which causes a problem. So, for Netscape users, we send the "meta" tag, which Netscape uses to load the "parsing" page instead of redirecting. The referrer is sent to the server by Netscape when directed by "meta".

Conditionally redirecting based on the referrer (and browser type) is something that the standard version of NetCloak 2.0 has done for some time. I found a nice fast way of doing this hack, but others get the credit for the idea and early implementation. In particular...

Everyone on the MacHTTP-Talk (now WebSTAR-Talk) listserv, and in particular, the individual who asked if this could be done (whose name I can't find, remind me if you know).

Brad Shrick, who filled me in on "meta" when I hit the wall trying to get Netscape to work (and who runs a great site of great sites).

Peter Storm at Silk Presence and Pierre Duchene also had the idea and implemented a version that handled the problem for Netscape (and possibly others, I don't know the whole history).

Download the NetCloak HTML Example From

<http://maxum.catalogue.com/downloads/CrossTown.sit.hqx>

This example file does not include the NetCloak demo package, which is available from the NetCloak 2.0 Page. If you have questions or problems, send me e-mail (john@maxum.com) and I'll add them (with answers) to this page to hopefully make this whole operation a piece of cake for anyone who wants to try it.

Last updated by John O'Fallon (john@maxum.com) on 8/25/95.

StyleWriter printers: How to generate a test page (10/95)

=====

Article Created: 2 October 1995
Article Reviewed/Updated: 9 October 1995

TOPIC -----

This article explains how to generate a test page with some of the StyleWriter family printers.

DISCUSSION -----

StyleWriter
=====

Step 1

Turn printer off.

Step 2

Press and hold the Form Feed button.

Step 3

Press the Power button and release both the Form Feed and Power buttons simultaneously.

Portable StyleWriter
=====

Step 1

Turn printer off.

Step 2

Press and hold FWD ADJ and REV ADJ buttons.

Step 3

Press and hold Power button. Wait for a single beep and release the power button.

Step 4

Wait for another beep and release the FWD ADJ and REV ADJ buttons.

Step 5

Immediately press the LF/FF button.

The Portable StyleWriter prints a small test pattern.

StyleWriter II
StyleWriter 1200
Color StyleWriter Pro
Color StyleWriter 2200
Color StyleWriter 2400
=====

Step 1

Turn printer off.

Step 2

Make sure the printer has paper loaded.

Step 3

Press and hold power button.

Step 4

Release power button when orange light turns off.

SCSI Manager 4.3.1: Use Custom Install of 7.5.1 on LC 575 10/95

Revised: 10/2/95
Security: Everyone

SCSI Manager 4.3.1: Use Custom Install of 7.5.1 on LC 575 10/95

=====

Article Created: 2 October 1995

TOPIC -----

Why does SCSI Manager 4.3.1 not get installed on my Macintosh LC 575 by System 7.5 Update 1.0?

DISCUSSION -----

The Easy Install script of System 7.5 Update 1.0 will install SCSI Manager version 4.3.1 on the Macintosh LC 575 only if SCSI Manager 4.3 already exists in the System Folder you are updating. If SCSI Manager 4.3 is not already installed on your hard drive, use the custom install feature in System 7.5 Update 1.0 to install SCSI Manager version 4.3.1.

Monitor Sleep: Third Party PCI Video Cards Supported? (10/95)

Revised: 10/2/95
Security: Everyone

Monitor Sleep: Third Party PCI Video Cards Supported? (10/95)

=====

Article Created: 2 October 1995

TOPIC -----

Do third party PCI Video Cards support sleep? Is this a feature the developer has to incorporate in their driver/hardware?

DISCUSSION -----

Third party PCI Video Cards can support sleep. Card developers are responsible for supporting the sleep features provided by the Power Manager.

In Apple's "Designing PCI cards and Drivers for Power Macintosh Computers" document, Apple sets guidelines for power management for specific classes of drivers. To be compatible with the Energy Saver control panel, graphics drivers should support the GetSync and SetSync status and control calls to implement the VESA Device Power Management Standard (DPMS) for power management. This allows the Display Manager to handle all interaction with the Power Manager on behalf of the driver.

Battery Tools 2.0: Read Me File (10/95)

Revised: 10/2/95
Security: Everyone

Battery Tools 2.0: Read Me File (10/95)

=====

Article Created: 2 October 1995

TOPIC -----

This article contains the ReadMe file included with Battery Tools 2.0 software that ships with Type III batteries and is posted online.

DISCUSSION -----

Important Information about your Type III Battery

The PowerBook Duo 280 and 280c include support for the PowerBook Duo Type I, Type II and Type III batteries. No update is necessary. To use a Type III battery with an older PowerBook Duo, read this update.

Using a Type III battery with an older PowerBook Duo

=====

To use PowerBook Duo Type III NiMH batteries on a PowerBook Duo 210, 230, 250, or 270c follow these steps:

Step 1

Insert the Battery Tools disk into a floppy drive attached to your PowerBook Duo.

Step 2

Open the Battery Tools disk and drag the "Type III Battery" extension to your System Folder.

Step 3

Restart your PowerBook Duo with the power adapter attached to your computer.

Step 4

Remove your old battery and insert the Type III battery into your PowerBook Duo.

Step 5

Unplug the power adapter from your computer.

If your computer does not work after you insert the Type III, plug in the power adapter and restart your computer. Once you restart your computer, check to see that the "Type III Battery" extension is in the Extensions folder in your System Folder. If you see the "Duo Battery Patch" extension in the Extensions folder, you should drag it to the trash. The "Type III Battery" extension replaces the "Duo Battery Patch" extension.

A new Battery Reconditioning application program (version 1.1) is provided on the Battery Tools disk so you can recondition Type III batteries if you own a PowerBook Duo 270c. If you have a PowerBook 210, 230, or 250, you cannot use the Battery Reconditioning program.

Recharging Type III batteries in an external recharger

=====

If you have an external battery recharger, you may need to update it to be able to charge Type III batteries. Follow these steps:

Step 1

Shut down your PowerBook Duo.

Step 2

Plug one end of the power cord into the power adapter and the other end into a three-hole grounded outlet or power strip.

Step 3

Snap the recharger onto the power adapter (as shown in the Getting Started manual).

Step 4

Plug the power adapter cable into the power adapter port on the back panel of the computer.

Step 5

Turn on your PowerBook Duo.

The battery recharger is automatically updated, and should now charge Type III batteries. You only need to do this once. If you try to charge a Type III

battery after you have followed these steps, and a red light appears on the recharger when you insert the battery, call Apple or see an Apple-authorized dealer.

Apple Internet Mail Server (1/96)

Revised: 1/17/96
Security: Everyone

Apple Internet Mail Server (1/96)

=====

Article Created: 2 October 1995
Article Reviewed/Updated: 17 January 1996

TOPIC -----

This article describes the Apple Internet Mail Server, formerly known as MailShare, an unsupported freeware Simple Mail Transport Protocol (SMTP) and Post Office Protocol version 3 (POP3) mail server.

DISCUSSION -----

Apple Computer has acquired a server software package formerly known as MailShare, an easy-to-use, Macintosh-based electronic-mail server designed specifically for managing messages on the Internet. Apple plans to rename the product, Apple Internet Mail Server, and it is Apple's intention to continue making the current version of the software available as freeware on the Internet.

The server software, acquired from Internet software developer Glenn Anderson, supports SMTP and POP3, two mainstream standards for Internet e-mail. The software allows Internet users to send and receive e-mail over the Internet from any personal computer that supports the SMTP and POP3 standards, such as Eudora Pro and Eudora Lite for Macintosh and Windows, POPmail II, and the PowerTalk gateway available from Starnine Technologies, Inc.

Availability

Apple expects to continue to make the current freeware version of the Apple Internet Mail Server (formerly known as MailShare) available on the Internet. As is the nature of freeware software, Apple DOES NOT plan to provide support for the freeware version. It can be downloaded at:

<http://www.solutions.apple.com/AIMS/default.html>

Power Macintosh 7500 & 8500: Mac ODBC 2.1 Install Issue (10/95)

Revised: 10/2/95
Security: Everyone

Power Macintosh 7500 & 8500: Mac ODBC 2.1 Install Issue (10/95)

=====

Article Created: 2 October 1995

TOPIC -----

I have a Power Macintosh 7500 and 8500. I easily installed Mac ODBC version 2.1 from the Mac ODBC Developer's Kit and now I get an Error Type 10 during startup. What's wrong?

DISCUSSION -----

When you install the 680x0 processor-based version of Mac ODBC 2.1 on a Power Macintosh 7200, 7500, 8500, or 9500, an older version (1.1.2) of the Shared Library Manager is installed. Unfortunately, the install process deletes the newer Shared Library Manager 2.0 that is already present on these computers with Open Transport version 1.0.x. Power Macintosh 7200, 7500, 8500, or 9500 computers should be pre-installed with Shared Library Manager 2.0 and Shared Library Manager PPC 2.0 with System Software 7.5.2.

You can correct this by removing the old Shared Library Manager and reinstalling the newer version from the Power Macintosh 7500 or 8500 CD. This can be done by custom installing the Networking Software.

QuickDraw GX Patch For Print Spoolers (10/95)

Revised: 10/3/95
Security: Everyone

QuickDraw GX Patch For Print Spoolers (10/95)

Article Created: 3 October 1995

TOPIC -----

I have a question about QuickDraw GX and AppleShare Print Server, and if what I describe below affects other print spoolers like Novell Netware.

I installed QuickDraw GX 1.1.1 on my Workgroup Server 6150, with System 7.5.1, and set up a queue for two captured printers. The behavior described below occurred on both captured printers which were a LaserWriter Pro 630 and LaserWriter 16/600 PS.

The desktop print queue can be created, but when attempting to print, the desktop printer will hang when it tries to check characteristics of the printer (I used an MS Word file). The queue then gives an error message that the job can't print because the connection to the printer was "closed unexpectedly". The print job never got to the spooler.

If I try printing a text file, it appears to reach the spooler, but then times out. The queue reports, "Apple Query for PatchP..." in the first entry in the queue, then "Timed Out" in the second.

DISCUSSION -----

There is a known problem when printing with QuickDraw GX to a printer captured by an AppleShare Print Server, as well as a Novell Netware server. This problem has been resolved with a "patcher" program available on several online services.

There are actually three patcher utilities, one for each version of QuickDraw GX currently in use (QuickDraw GX 1.1.1, 1.1.2, and 1.1.3). All you need to do is run the patcher program, and follow the instructions in the dialog that is displayed.

These articles can help you locate the software update mentioned here:

AppleShare Print Server 4.x and Pro: Specifications (10/95)

Revised: 10/3/95
Security: Everyone

AppleShare Print Server 4.x and Pro: Specifications (10/95)

Article Created: 3 October 1995

TOPIC -----

This article provides specifications on AppleShare Print Server 4.x and Pro.

DISCUSSION -----

The following specifications apply for AppleShare Print Server 4.x and Pro:

Begin_Table

Maximum number of captured printers	5
Maximum number of spooled sessions per printer	8
Maximum number of queued files	1000
Maximum number of log entries	1000

End_Table

NOTE: The AppleShare Print Server can capture printers which use LaserWriter, AppleTalk ImageWriter, or AppleTalk ImageWriter LQ printer drivers (chooser extensions). Third-party printers requiring custom printer drivers cannot be captured for spooling by the AppleShare Print Server.

AppleVision: Use Sound & Displays Control Panel On 7500 (1/97)

Revised: 2/5/97
Security: Everyone

AppleVision: Use Sound & Displays Control Panel On 7500 (1/97)

Article Created: 3 October 1995
Article Reviewed/Updated: 5 February 1997

TOPIC -----

I have successfully installed the AppleVision software that came with my AppleVision 1710AV display, but I am unable to locate the AppleVision Setup control panel. I am using a Power Macintosh 8500. What do you recommend?

DISCUSSION -----

AppleVision Setup does not appear as a separate control panel on either the Power Macintosh 8500 or 7500 series computers. If you have installed the AppleVision software, the settings options found in the AppleVision Setup control panel are automatically incorporated into either the Sound and Displays control panel or Monitors & Sounds control panel, depending on which version of the Mac OS you are using.

To access the configuration options for your AppleVision 1710AV Display or AppleVision 1710 Display, follow these steps:

Step 1

Open the Sound and Displays (or Monitors & Sounds) control panel.

Step 2

Double-click the text "AppleVision 1710AV", which is in the lower right corner in the Displays option section.

Although the interface may be slightly different than described in your AppleVision manual, you can now access the same options mentioned in the documentation for the AppleVision Setup control panel.

Article Change History:

05 Feb 1997 - Added new control panel name.

23 Oct 1995 - Corrected minor typographical error.

SoftWindows: Does Not Recognize PC Cards on PowerBooks (10/95)

=====

Article Created: 3 October 1995

TOPIC -----

I am running SoftWindows on my new PowerBook 5300. Will the SoftWindows emulation software communicate through my PC Card Modem or PC Card Ethernet?

DISCUSSION -----

Insignia's SoftWindows product currently does not recognize PC Cards when used on the PowerBook 5300 series. As a result, SoftWindows users will not be able to communicate via a PC Card modem or PC Card Ethernet. The reason for this is that SoftWindows communicates directly to the hardware and does not look for PC Cards that may be inserted into a PowerBook 5300.

Insignia is aware of the problem and is working on a solution.

AWS 95: Increasing The Number of Mount Points (10/95)

Revised: 10/4/95
Security: Everyone

AWS 95: Increasing The Number of Mount Points (10/95)

=====

Article Created: 4 October 1995

TOPIC -----

How can the number of mount points, accessible by A/UX on an Apple Workgroup Server (AWS) 95, be increased?

DISCUSSION -----

The number of mount points, that can be addressed by A/UX, is determined by the kernel configuration parameter, NMOUNT. The default value on the AWS 95 File Server is set at 32. Changing this value can be accomplished as follows:

NOTE: This process requires being logged in as root and will involve restarting the computer.

Step 1

Open a command shell.

Step 2

Execute the command, "kconfig -n /unix".

Step 3

Enter "NMOUNT=value" followed by a carriage return. The "value" entry would be the decimal constant for the number of mount points desired. For example, "NMOUNT=40" provides a maximum of forty mount points.

Step 4

Type a Ctrl-D to exit kconfig.

Step 5

Execute "sync;sync;sync;reboot" to synchronize and reboot the system.

PowerBook 5300 & 190: Identifying LiIon & NiMH Batteries (10/95)

Revised: 10/4/95
Security: Everyone

PowerBook 5300 & 190: Identifying LiIon & NiMH Batteries (10/95)

Article Created: 4 October 1995

TOPIC -----

How can I tell the difference between a Lithium Ion (LiIon) battery and a Nickel Metal Hydride (NiMH) battery?

DISCUSSION -----

LiIon

The Lithium Ion battery has a battery gauge (four LEDs) on the same side as the release mechanism. A button above four LEDs can be pressed to show the approximate charge level in the battery. Also, the top right corner of the battery's label indicates that the battery is Lithium Ion. (Li-Ion) is printed on the label.

NiMH

A Nickel Metal Hydride battery does not have any way of determining the charge level on the battery itself. There is no LED gauge. The label indicates that the battery is NiMH in the top right corner.

Note: If the battery is identified as LiIon, it should be returned to Apple immediately. For more information contact Technical Support at 800-SOS-APPL or Customer Support at 800-776-2333.

System 7.5.2 Printing Fix: Read Me File (10/95)

Article Created: 4 October 1995
Article Reviewed/Updated: 10 October 1995

TOPIC -----

This article contains the ReadMe file included with the System 7.5.2 Printing Fix 1.0.2 extension posted online.

DISCUSSION -----

Macintosh System 7.5.2 Printing Fix Read Me

What is the Macintosh System 7.5.2 Printing Fix?

This extension fixes a printing problem that may occur on Power Macintosh 7200, 7500, 8500, and 9500 computers using System 7.5.2. Without this fix, your computer may freeze if you attempt to print on a network-based printer that is already busy, and it may be necessary to restart your computer.

To install this extension follow these steps:

Step 1

Locate the System Folder on your computer's hard disk. Don't open the System Folder.

Step 2

Drag the file named "7.5.2 Printing Fix" to the System folder.

Step 3

A message appears asking if if you want the 7.5.2 Printing Fix to be put into the Extensions Folder. Click OK.

Step 4

Under the Special menu, choose Restart.

At Ease for Workgroups 3.0: Accessing Floppy Only (10/95)

Revised: 10/4/95
Security: Everyone

At Ease for Workgroups 3.0: Accessing Floppy Only (10/95)

=====

Article Created: 4 October 1995

TOPIC -----

I am using At Ease 3.0 for Workgroups and I noticed some of my users are able to save files to the hard drive even though I have selected the store user documents on floppy disk in the Locations panel. When the user tries to save their file a dialog box appears asking them to insert a floppy disk. If the student clicks the Continue button without inserting a floppy disk, they can save anywhere on the hard drive. How can I fix this?

DISCUSSION -----

There are two panels that need to be set properly for At Ease to prevent the user from accessing the hard drive from the Open or Save dialog boxes. In this case the Security Panel is not set correctly. Follow these steps to allow users to only save and/or open documents from a floppy disk:

Locations Panel
=====

Step 1

Launch At Ease Setup, open the Setup in which this problem is occurring.

Step 2

Click the Disk Icon button to go to the Locations Panel.

Step 3

In the second section:

Store user documents on:

☐ Setup location volume

☐ Floppy Disk

Click the box to put an x in the Floppy Disk section to store the users documents on a floppy disk.

Security Panel =====

Step 1 -----

Click the Padlock button to go to the Security Panel.

Step 2 -----

In the first section:

For new documents, users are required to use their At Ease Documents folder to:

☐ Open

☐ Save

Click the box to put an x in the Open section if you want your users to only be able to open documents from a floppy disk. Click the box to put an x in the Save section if you want your users to only be able to save documents to a floppy disk.

Having both Open and Save selected are the default settings, so they must have been changed in order for the problem you were experiencing to have occurred.

At Ease 3.0: Use Button Disabler To Prevent Sound Access (1/97)

Revised: 1/7/97
Security: Everyone

At Ease 3.0: Use Button Disabler To Prevent Sound Access (1/97)

Article Created: 4 October 1995
Article Reviewed/Updated: 7 January 1997

TOPIC -----

At Ease for WorkGroups 3.0 allows the administrator to keep students from opening control panels, specifically the Sound control panel. However, on the Macintosh Performa/LC 520, 550, 575, 580, 5200, 5300, and 5260 series of computers, there are volume controls on the front of the computer that still work even when the students do not have access to the control panels. How can I prevent students from using these buttons to defeat At Ease?

DISCUSSION -----

System 7.5 includes a Control Panel called Button Disabler that can be installed with a custom system software install. This control panel has a single check box that, when checked, deactivates the sound and brightness controls on the front of Macintosh computers with built-in controls.

Use the Custom Install feature of your Macintosh CD to install the Button Disabler control panel, restart your computer, and click to place an 'X' in the box to the left of "Disable Buttons".

Article Change History:

07 Jan 1997 - Removed the Performa 5400 from the article.
11 Sep 1996 - Added the Performa/LC 5260, and 5400 series computers.
23 Oct 1995 - Clarified Control Panel settings.

Color LW 12/600 PS: Requires Special Transparencies (2/96)

Revised: 2/13/96
Security: Everyone

Color LW 12/600 PS: Requires Special Transparencies (2/96)

=====

Article Created: 5 October 1995
Article Reviewed/Updated: 13 February 1996

TOPIC -----

How does the Color LaserWriter 12/600 PS determines that a transparency is printing? Is it by software or hardware? When I try to print on a transparency I get a paper jam error.

DISCUSSION -----

In order to optimize the print quality when printing transparencies the Color LaserWriter 12/600 PS requires a special transparency material.

The Color LaserWriter uses a photosensor to detect the presence of the special transparencies by looking for a reflection from the white rectangle at the leading edge of the transparency. When the white rectangle is detected the printer enters into the transparency mode. If standard transparencies are used which do not contain the white rectangle, or the white tape strip at the leading edge then a paper jam error is displayed on the status panel.

When the Color LaserWriter 12/600 PS is in the transparency mode an extra transfer drum rotation is added to the end of the printing process during which the transfer drum and fuser rotational speed is cut in half to improve the toner fusing characteristics.

Before assuming that a hardware failure has occurred with the printer consult the Color LaserWriter 12/600 PS user's manual and review the following precautions to reduce jamming problems when printing on transparencies:

- Use only transparencies designed for use with the Color LaserWriter 12/600 PS (Apple part number M3876G/A). There are two different types of transparencies that have been shipped by Apple. See the diagram below to determine which type you have. Both types of transparencies offer the same features and functionality.

- Insert Color LaserWriter transparencies as shown in figure 1, other orientations will cause jams. When using transparency type #2 leave the tape side up when placing them in the multi-purpose tray.
- DO NOT print transparencies from the 250 sheet cassette, print only from the multipurpose tray

Begin_Graphic

Transparency Type #1

Transparency Type #2

FIGURE 1- Correct transparency orientation

End_Graphic

Note: @@@@ represents areas filled with white

The white tape strip found on the type #2 transparencies can be removed after the transparency has passed through the fuser assembly.

When printing Transparencies, you should also select "Transparency" in the Print Options dialog box. This changes the halftoning structure to allow for a lighter image, and allows for a better "transparency" when viewed through an overhead projector.

Article Change History:

13 Feb 1996 - Added additional transparency type.

PowerBook 190 & 5300: Battery Voltage Measurements (10/95)

Article Created: 5 October 1995
Article Reviewed/Updated: 17 October 1995

TOPIC -----

What are the respective voltages of the Nickel-Metal-Hydride (NiMH) battery when it is: full, at first battery low warning, at the second battery low warning, and then at the final battery low/going to sleep warning?

DISCUSSION -----

The following is a list of the voltage measurements for the NiMH battery used in both the Macintosh PowerBook 190 and 5300 series computers:

Begin_Table

Full Voltage:	16.1 volts +/- 0.1v
First Battery Low Dialog:	14 volts
Second Battery Low Dialog:	Approx. 13.6v*
Third (Final) Battery Low Dialog:	Approx. 13.1v*

* This approximate reading is a result of an extrapolation.

End_Table

Note: Voltages shown here were measured on Fluke 77 Voltmeter on 10 batteries in the Apple Reliability Laboratory. Please keep in mind that you might not get exactly the same readings from your batteries, but they should be similar.

Color STW 2400 & StyleWriter 1200 Printing Underscore (10/95)

Revised: 10/5/95
Security: Everyone

Color STW 2400 & StyleWriter 1200 Printing Underscore (10/95)

=====

Article Created: 5 October 1995

TOPIC -----

When printing to the StyleWriter 1200 or StyleWriter 2400 consecutive "_" characters look like a solid line on the screen, but when printed they end up printing a dashes.

DISCUSSION -----

The problem only seems to occur if the Geneva font is used, Chicago, Courier, and Helvetica do not have this problem. This has been reported to engineering. There are three workarounds you can use instead.

Workarounds
=====

- 1) Use any other font except Geneva.
- 2) Select the underscore characters (_), and change only that selection to Chicago, Courier, or Helvetica.
- 3) Use spaces or tabs in place of the underscore characters (_), then select the option to underline.

Note:

If you want even underscore lines, you should use tabs. With the exception of the Monaco and Courier typefaces, which are monospace fonts, the typefaces in your Fonts folder are proportional. This means that not all letters take up the same amount of space. If you use a typeface such as Times, underscores that look aligned when printed, will not always be aligned.

System 7.x: What Does Holding Shift Key at Startup Do? (10/95)

Revised: 10/6/95
Security: Everyone

System 7.x: What Does Holding Shift Key at Startup Do? (10/95)

=====

Article Created: 5 October 1995

TOPIC -----

What is disabled when the shift key is held down during startup?

DISCUSSION -----

Here is a list of items that get turned off by holding down the shift key during startup:

- MacsBug - however, MacsBug will load if the option key is also held down along with the shift key in System 7.5 and later.
- All extensions in the Extension folder, Control Panels folder, and System Folder.
- A/Rose - even though it is an init and would be turned off anyway, it is explicitly not loaded.
- Any software component of type 'thng' will not be registered.
- All scripts (for non-roman character input).
- Virtual Memory.
- Resources of type AINI which are AppleTalk drivers, this is where Open Transport gets turned off.

Other effects:

- The disk cache is set to 96K in System 7.5 and 64K in System 7.0 or System 7.1.
- The Finder will not launch files in the Startup Items folder, or execute the items in the Shutdown Items folder at Shut Down.

ClassMaster: Losing Student Records (10/96)

Revised: 10/10/96
Security: Everyone

ClassMaster: Losing Student Records (10/96)

Article Created: 6 October 1995
Article Reviewed/Updated: 10 October 1996

TOPIC -----

I recently installed the ClassMaster software that came with my Teacher Solution Bundle. I installed it and entered my students' information with no problem.

I recently noticed that some student records are starting to disappear. I am having no other problems with my system and even Disk First Aid reports there is nothing wrong with my hard drive. What is wrong?

DISCUSSION -----

Issue

TechByte, the makers of ClassMaster, discovered an issue with the version of Classmaster that shipped on early Teacher Solution Bundle CDs. When the teacher deletes a student, the student below that record also appears to be deleted. Resorting the student database brings the second "apparently deleted" student back.

Resolution

The problem has been corrected in a newer version of ClassMaster. Check the serial number on the ClassMaster splash screen. M1094AEA is the version that exhibits the problem. M1095AEA is the updated version.

If you have the earlier version (M1094AEA), contact TechByte to receive an updated version of the program. Let the TechByte technical support representative know that you are having problems with losing student data. TechByte should give them two options to fix the problem.

- You can either be sent an updated copy of the program that has this problem fixed in it free of charge.

-or-

- You can upgrade (for a charge) to a newer recently released version of Classmaster that not only fixes the problem with losing student data, but also adds new features. TechByte can tell you what the "new features" are.

If you do not want to contact TechByte, or have already contacted TechByte and for some reason were told to contact to Apple, then Apple can send you the newer version of ClassMaster.

Newer Version Now Bundled

In the November 1995 time frame, Apple began including the Classmaster Update disk and installation instructions with the Teacher Solution Bundle.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

10 Oct 1996 - Added information about how to get newer version.

PowerBook: 400 Hz -> 60 Hz Converters For Airplanes (10/95)

Revised: 10/6/95
Security: Everyone

PowerBook: 400 Hz -> 60 Hz Converters For Airplanes (10/95)

=====

Article Created: 6 October 1995

TOPIC -----

I work for an airline and have a Macintosh PowerBook computer. I would like to be able to run my computer from one of the AC service outlets, particularly on long flights. Such outlets are available on the plane in the cockpit and galley areas. They are 115 VAC/400 Hz power supplies. However, the computer's power adapter requires a 50 to 60 Hz input source. Is there any kind of adapter I can use to make this work?

DISCUSSION -----

Apple Computer, Inc. does not provide or support any solution for the situation you describe. However, one company, DLC Research, has advertised a solution in the Airline Pilots' Association periodical, "Airline Pilot". Partial text of their advertisement is as follows:

"...for Notebook Computers and other portable electronic devices. The APA 2000 will operate from any aircraft service outlet -- converting 115 VAC 400 Hz aircraft power to standard 115 VAC 60 Hz."

This article provides information about a non-Apple product and is posted for informational purposes only. No endorsement by Apple Computer, Inc. is either declared or implied. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, DLC Research, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Apple Printer Utility: Problems with Open Transport 1.0 (5/96)

Revised: 5/15/96
Security: Everyone

Apple Printer Utility: Problems with Open Transport 1.0 (5/96)

=====

Article Created: 9 October 1995
Article Reviewed/Updated: 15 May 1996

TOPIC -----

I have a Power Macintosh 9500 and cannot see any printers with the Apple Printer Utility v2.0. There are no zones defined on either my Ethernet or LocalTalk network.

DISCUSSION -----

There is a conflict between the Apple Printer Utility and Open Transport 1.0. For example, if you launch Apple Printer Utility v2.0 on a Power Macintosh 9500*, and if there are no zones on your network, no printers are displayed in the printer list. Fortunately, the majority of Ethernet networks have defined zones, and Power Macintosh 9500 computers are now shipping with a newer version of Open Transport, so this conflict will not likely be common. This conflict is not restricted to Ethernet networks, it also occurs when using LocalTalk.

* Note:

The Power Macintosh is the only computer that shipped with Open Transport v1.0

Workaround

=====

Upgrade your Power Macintosh 9500 from Open Transport v1.0 to v1.1. Version 1.1 does not have this conflict, and it is part of the System 7.5 Update 2.0 available on online services Apple publishes software updates on.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the

Apple Tech Info Library.

Article Change History:

15 May 1996 - Added information on LocalTalk also being affected.

Color LW 12/600 PS: Linescreen in Transparency Mode (1/97)

Revised: 1/31/97
Security: Everyone

Color LW 12/600 PS: Linescreen in Transparency Mode (1/97)

Article Created: 9 October 1995
Article Reviewed/Updated: 31 January 1997

TOPIC -----

I have a Color LaserWriter 12/600 and have the following questions:

What is the effective Linescreen of the Color LaserWriter 12/600? I have read that it changes from 200 to 141 depending upon the image type. Can you override these settings?

Are there any changes made when printing in Transparency mode? There are certain applications that do not give you the option to print in Transparency mode (such as PageMaker) is there a way around this?

I have also heard that although the options for different color matching are available, they are ignored by most applications. Is this true of the Transparency mode as well?

I know that the Transparency mode changes the speed of the overall throughput, I have not seen any other changes as I have tested it.

DISCUSSION -----

The linescreen on the Color LaserWriter 12/600 PS and the Color LaserWriter 12/660 PS printers is 200 lpi (lines per inch), and it CANNOT be changed; the firmware in these printers ignores any PostScript commands to change the linescreen. Depending on the area being imaged, the linescreen will change to an effective 141 lpi -- mostly in the lighter areas of an image. These settings, unfortunately, cannot be changed because they have been set to provide the optimum results from the print engine.

With transparencies, the only change (other than print engine speed) is that the halftoning structure is changed to allow for a lighter image, and in turn better "transparency" when viewed through an overhead. You may be able to notice the individual halftone cells due to the lower lpi, but this effect is only seen

when the transparency is viewed without an overhead projector -- it is not present when viewed through a projector.

To answer your other questions, we are unable to determine how to print in "transparency mode" through PageMaker; this is a function of the Apple print driver, and PageMaker uses their own driver. Customers should contact Adobe for this information. With regard to color matching being ignored by most applications, this also holds true in transparency mode.

Article Change History:

31 Jan 1997 - Added Color LaserWriter 12/660 PS printer to the article.

MAE 2.x and Simultaneous Access (10/95)

Revised: 10/9/95
Security: Everyone

MAE 2.x and Simultaneous Access (10/95)

Article Created: 9 October 1995

TOPIC -----

What version of MAE do I need to let more than one client simultaneously access it from a UNIX workstation? At one version of MAE beta software this feature was possible, but the final version doesn't have this capability.

The reason I ask for this is to lighten the burden of administration, and reduce drive real estate space on my servers. I have chosen to still use a beta copy of MAE because my MAE 2.x final version is only license for one user. I need to either have MAE support 3 clients per copy with a copy of MAE on each of our 10 servers, or have one major copy of MAE supporting 30 clients.

DISCUSSION -----

First, MAE is licensed for either a login user ("john"), or a display ID ("sparc5"). Also, MAE is capable of letting multiple users simultaneously access and run the same copy of MAE on an UNIX workstation, just like an X Windows application can be shared over the network.

For best performance, you must manage and balance the work load on your UNIX servers according to each server's power. MAE performance is highly dependent upon the X server, X client, and network bandwidth and traffic.

MAE can be purchased in one single user, 20 user, 50 user, or volume (site license) license packages.

For the situation you describe, 10 servers to be used by 30 clients, the following suggestion may work:

- Get 30 licenses of MAE, one for each client.
- Install a copy of MAE on each of the 10 servers, and assign 3 clients, either user login ID, or display ID, to each workstation.

- Keep a single copy of the licence file on one workstation for license integrity checking.

The above solution is based on the assumption that all of the workstations are equal in CPU power.

At Ease: Adding CD-ROM Based Applications to Setups (10/95)

Revised: 10/16/95
Security: Everyone

At Ease: Adding CD-ROM Based Applications to Setups (10/95)

=====

Article Created: 9 October 1995
Article Reviewed/Updated: 16 October 1995

TOPIC -----

I need to run programs on a CD-ROM disc from within At Ease. I do not know how to set up At Ease so that I can use the program directly from the CD-ROM disc without copying it to the hard drive. The program will not work properly if I copy it to the hard drive. How can I access a program on a CD-ROM disc from At Ease?

DISCUSSION -----

You can run an application on a CD-ROM disc without having to copy it to the hard drive.

Follow these steps for the version of At Ease you have:

At Ease 1.0

=====

Step 1

Insert the CD-ROM disc containing the program you wish to give access to.

Step 2

Open the At Ease Setup control panel in the Control Panels folder of your System Folder.

Step 3

Click the Select Items button.

Step 4

Click the Desktop button in the Open Dialog box. Double-click the name of the

CD-ROM disc that appears in the window in the left side of the Open Dialog box.
Click the Gather Applications... button.

Step 5

A dialog box will appear telling you which applications are on the disc that are not in At Ease. You will have the option to Add or Cancel. Click Add. You can remove any extra unwanted applications from the At Ease Items window by selecting each once and clicking Remove.

Step 6

Click Done, close the At Ease setup window.

At Ease 2.0.3 and At Ease 3.0

=====

Step 1

Insert the CD-ROM disc containing the program you wish to give access to.

Step 2

Open the At Ease Setup program.

Step 3

Double click the Setup you would like to add the program to.

Step 4

Click the Items icon to open the Items panel. Click the Add Applications button.

Step 5

In the Add Applications screen, you will see a choice of applications on the left side. Click and hold the word "Disk" at the top left corner to see the pop-up menu.

Step 6

Select the name of the CD-ROM which is currently in your computer and release. At Ease will search for any applications on that CD.

Step 7

Double-click the name of the program you want to add to the list of Items for This Setup on the right. Or, you can hold the shift key while single-clicking each application to select multiple items and then click the ">>Add>>" button. Repeat this process until you have added all the programs you want from the CD-ROM disc.

Step 8 for At Ease 3.0 only

At Ease 3.0 can allow access to all, none, or only administrator defined CD-ROM discs. Under the Options menu, choose CD-ROM Preferences. In order for the user of this setup to access the program you just added from this CD, click "Allow access to all CD-ROMs" (default setting).

If you want to limit access to only certain CD-ROMs discs, click the "Only allow access to the specified CD-ROMs" button. If you choose this option, you must click the Add button and select the mounted CD-ROM with the program you just added to this Setup. You can eject this disc and add other discs you want users of this setup to have access to from within this panel.

Step 9

Click the "OK" button and follow the rest of the steps as necessary to set up At Ease the way you like.

When you return to At Ease, you will see the button for the application you added in the At Ease panel. If you click the button and the disc is not already in the computer, a message asking you to insert the proper CD-ROM disc will appear.

Apple Guide: Can I Print the Entire Apple Guide? (10/95)

Revised: 10/9/95
Security: Everyone

Apple Guide: Can I Print the Entire Apple Guide? (10/95)

=====

Article Created: 9 October 1995

TOPIC -----

I want to print out the entire Macintosh Apple Guide. I cannot seem to find the Print command. How can I send the Apple Guide to print?

DISCUSSION -----

There is no way to print Apple Guides. They have no menu items associated with them because they exist in a floating palette that is independent of the frontmost application and its menubar. That is, you can switch applications and the Guide stays on the top layer even though the menubar and application context has changed. This is so Guides can lead you through steps that may involve switching between multiple applications and always be the topmost window.

Tutorial Guide files do not lend themselves to printing in a linear fashion anyway. They are context sensitive databases. Guide sequences are really tree structures describing different actions to take with several branch paths depending on the current environment. You may notice that a Guide may not lead you through the same steps to perform an action every time. This is because it detects that, maybe today, you already have the Apple Menu Items folder or Control Panels folder open and it will skip the associated steps telling you to open that folder. So one user may see a different set of steps than another user for the same action sequence.

If you were able to print the branches of the tree sequence linearly, then each page would have to tell you which page to turn to next, since many times it would not be the following page. This would not be an easy book to follow. The advantage of the Guide is that it can do this jumping for you and even skip the pages you do not need to see.

There are five classes of Guide files. Tutorial, Help, and Other Guide files do not lend themselves to printing as described above. About and Shortcut Guides are simpler cases where each page is usually a stand alone piece of information with no action sequencing. These Guides usually contain a small number of Guide

Panels. An About Guide might have one or two pages and a Shortcut Guide might have six to twelve pages. You could take screen shots of these types of Guides using Command-Shift-3 and open, edit and print the captured PICT files.

QuickDraw GX: What Fonts Come With QuickDraw GX? (10/95)

Revised: 10/9/95
Security: Everyone

QuickDraw GX: What Fonts Come With QuickDraw GX? (10/95)

=====

Article Created: 9 October 1995

TOPIC -----

What fonts come with QuickDraw GX, and to what extent can I use them?

DISCUSSION -----

Four QuickDraw GX fonts are installed by the QuickDraw GX installer:

- Apple Chancery
- Hoefler (Roman, Italic, Ornaments)
- Skia
- Tekton Plus Regular.

These fonts are designed to work with QuickDraw GX savvy applications in a QuickDraw GX environment. If they are used with QuickDraw GX disabled, they display on the screen fine, but they will not print properly or perhaps not at all. Sometimes the font will be substituted with another font, other times the printer will give a memory error.

To activate QuickDraw GX, turn on the QuickDraw GX extension with the Extensions Manager in your Control Panels folder and restart your Macintosh computer. To determine whether or not an application is QuickDraw GX savvy, contact the manufacturer of the application.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

How To Unlock MacTCP Control Panel Settings (10/95)

Revised: 10/10/95
Security: Everyone

How To Unlock MacTCP Control Panel Settings (10/95)

=====

Article Created: 10 October 1995

TOPIC -----

When I click the more... button in the MacTCP control panel and go to its configuration screen, the setting titles are dimmed and the buttons are locked. What's wrong? How do I fix it?

DISCUSSION -----

The original settings may have been made using MacTCP Admin, which is available only with the product, TCP/IP Administration for Macintosh. When MacTCP Admin is used to configure the IP address and other settings, these settings cannot be altered using the MacTCP control panel. As an additional option, the administrator may also password-protect an individual's settings, which would require this password even if MacTCP Admin is used.

The reason for this security is because in most large IP environments addresses are assigned to individuals. Altering an IP address, may disrupt another user's access, or render the user's workstation incapable of communicating with the network.

If security is not an issue, a user should first verify, with the network administrator, that he or she has a list of the proper settings (IP address, Routing Information, Domain Name Server and address), and a copy of the MacTCP control panel that has never been configured. Then move from the System Folder or delete ALL of the MacTCP, MacTCP DNR, and MacTCP Prep files from the hard drive, restart, and then re-install and reconfigure the MacTCP control panel.

System 7.5 users may use the System 7.5 Installer by selecting Custom Install from the pop-up menu, selecting Control Panels, and then click MacTCP to install only the MacTCP control panel. Other users will obtain a fresh copy of the MacTCP control panel from their network administrator if site-licensed, or from the master disks of the product they purchased which included MacTCP.

HyperCard: Compact Color Database Causes Some Color Loss 2/96

=====

Article Created: 10 October 1995
Article Reviewed/Updated: 7 February 1996

TOPIC -----

After using "Compact Color Database" from the Edit menu of the color tools environment, some of the cards of my stack lost all their color objects.

DISCUSSION -----

This issue occurs in HyperCard 2.3 when used in conjunction with Color Tools Stack versions 2.3 through 2.3.3. This is due to an error in the AC_Compact handler in the Color Tools stack script. The solution for this problem is to update to the HyperCard 2.3.5 Stacks update posted online.

These articles can help you locate the HyperCard 2.3.5 Stacks mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

System 7.5.2: What Version of At Ease is Supported? (8/96)

Revised: 8/23/96
Security: Everyone

System 7.5.2: What Version of At Ease is Supported? (8/96)

Article Created: 10 October 1995
Article Reviewed/Updated: 23 August 1996

TOPIC -----

What version of At Ease is compatible with System 7.5.x?

DISCUSSION -----

With System 7.5.x you need to use At Ease 2.0.3, At Ease 2.0.3 for Workgroups, or At Ease 3.x. Previous versions of At Ease are NOT compatible with System 7.5.x.

Although At Ease 2.0.3 and At Ease 2.0.3 for Workgroups are compatible with System 7.5.x, some control panels and other features of System 7.5 may work differently while At Ease is running. This section provides information on these differences. Please refer to the Macintosh Guide, available in the Guide menu (marked with a question mark icon on the right of the menu bar), for more information on these topics.

AppleScript

Scripts written using AppleScript can be launched by At Ease. However, scripts that require the Finder will not run properly.

Extensions Manager

You cannot change the settings in this control panel while At Ease 2.0.3 is running.

Find File

When At Ease 2.0.3 or At Ease 2.0.3 for Workgroups is open, Find File does not allow you to open or print items that are found.

General Controls control panel

* Documents: This option can control where the Documents folder is created on your computer. At Ease always tries to open or save a document in the user's folder, within the At Ease Documents folder, regardless of the settings in the Documents option.

* If At Ease is running and you have not changed the Documents option, At Ease creates the Documents folder on the startup disk. If At Ease is not running and you select the Documents folder radio button, the Documents folder is created on the desktop.

* Launcher: The Launcher does not work with At Ease 2.0.3 and if it is set to open at startup, it will not do so.

Macintosh Easy Open (version 1.1 or later)

If you attempt to open a document without the application program that created it and Macintosh Easy Open is active, a dialog box asks if you want to open the document with another program. The only programs displayed are those made available to the user in the At Ease Setup program.

PowerTalk

You can now receive PowerTalk mail in the background while you are in At Ease. However, to read or write mail, you must be in the Finder.

QuickDraw GX

At Ease now supports printing from QuickDraw GX. However, once you start a print job you cannot log out of At Ease or go to the Finder until the printing is completed. If QuickDraw GX is installed, print jobs that are stopped cannot be restarted within At Ease. The user or the administrator must go to the Finder to restart a print job.

* Printer menu: When the user has access to the Chooser and QuickDraw GX is active, a new menu appears in At Ease called "Printer." This menu contains all desktop printers that have been created, with a checkmark next to the currently selected printer. To select a different printer, simply choose its name.

* Printer Status command: To view the status of the currently selected printer, choose Printer Status from the Printer menu. Print jobs started by your computer are displayed. A pop-up menu allows you to view the status of other printers.

Shutdown Items folder

The Shutdown Items folder is located within the System Folder. All items in this folder are started when you choose the Shut Down command from the Special menu to shut down your computer.

HyperCard: Unable to Capture Sound on PCI-Based Systems (2/96)

Article Created: 10 October 1995
Article Reviewed/Updated: 7 February 1996

TOPIC -----

I am trying to input audio into a HyperCard stack on my Power Macintosh 7500 computer. The sound seems to record fine, but when I play the sound back, all I hear is crackly, static noise. I have tried both HyperCard Player and a full version of HyperCard 2.3.3 and different microphones and computers.

DISCUSSION -----

Apple Engineering has recreated this issue on Power Macintosh 7200, 7500 and 8500 computers. This problem may also occur on Power Macintosh 9500 computers. This issue is fixed in the HyperCard 2.3.5 Stacks update posted online.

These articles can help you locate the HyperCard stacks mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

QuickDraw GX: Print Spooler Patch Read Me File (4/97)

Revised: 4/29/97
Security: Everyone

QuickDraw GX: Print Spooler Patch Read Me File (4/97)

Article Created: 10 October 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article contains the ReadMe file included with the QuickDraw GX Print Spooler Patch posted online.

DISCUSSION -----

About the QuickDraw GX Print Spooler Patch

The QuickDraw GX Print Spooler Patch fixes a problem when trying to print to AppleShare and Novell Netware print spoolers. This application makes changes to the QuickDraw GX extension and the LaserWriter GX printer driver. You must first make copies of the QuickDraw GX and LaserWriter GX files, and then run the patcher on the copies. Once the files are updated, you need to drag the original files in the Extensions folder to the Trash, and drag in the new updated files.

NOTE: You will not be able to "Empty Trash" until the computer is restarted.

Disclaimer

This patch is provided as a way to allow people to use the latest versions of QuickDraw GX with AppleShare and Novell Netware print spoolers. This patch is not officially supported by Apple Computer. These problems will be fixed in an upcoming release of QuickDraw GX.

Warning

This patch cannot work properly while virus detection software is running. Please make sure that you have disabled any virus detectors before applying the patch.

About this patch...

This patch application was made with ResCompare, a free resource comparison and patch generation utility. ResCompare can be FTP'ed from most Macintosh archive sites. Send e-mail inquiries regarding ResCompare to Michael_Hecht@mac.sas.com.

LaserWriter Software For Windows: Read Me File (1 of 2) (10/95)

Revised: 10/10/95
Security: Everyone

LaserWriter Software For Windows: Read Me File (1 of 2) (10/95)

=====

Article Created: 10 October 1995

TOPIC -----

This article contains the ReadMe file included with the LaserWriter Software For Windows version 1.1 posted online. This is part 1 of 2 of the document.

DISCUSSION -----

ABOUT YOUR APPLE LASERWRITER PRINTER SOFTWARE FOR WINDOWS
Revision 1.1

Revision 1.1 of the Apple LaserWriter Printer software for Windows 3.1 contains updated versions of these components:

••In part 1 of 2••

- Installer
- Apple Printer Utility
- Bidirectional driver

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference. You'll find information about:

- Installing the Printer Driver Software
- Installing additional PostScript printers
- Configuring the PostScript printer
- Deleting previous versions of the printer driver
- Installing the printer description on Windows NT 3.5
- Using the Apple Color LaserWriter 12/600 PS Printer
- Obtaining Printer Supplies for the Apple Color LaserWriter

12/600 PS

- Apple Printer Utility 2.0

••In part 2 of 2••

- AdobePS Printer Driver version 3.0
 - General driver compatibility issues
 - General font downloader compatibility issues
 - Application software compatibility issues

INSTALLING THE PRINTER DRIVER SOFTWARE

=====

Step 1

Start Windows 3.1.

Step 2

Exit from any applications that are now running.

Step 3

Insert Printer Disk 1 for Windows into your floppy disk drive.

Step 4

From the Windows Program Manager, choose File/Run.

Step 5

In the Command Line box, type a:\setup (where a: is your floppy diskette drive indicator), and click OK.

Step 6

The Welcome screen displays.

Step 7

Click Express Installation to continue the installation procedure. The installation begins. If the installer cannot copy the files to the WINDOWS/SYSTEM directory because that directory is write protected, it will alert you, asking whether to copy the files to an alternate directory.

Step 8

During the installation, the installer prompts you to restart Windows. Then, the Adobe PostScript Printers Control Panel asks you for the particular printer or printers to install. Highlight the printer name desired and click Install.

INSTALLING ADDITIONAL POSTSCRIPT PRINTERS FROM THEIR PPDS

=====

Step 1

Insert the diskette containing the PPD to be installed in a floppy diskette drive. The PPDs included with this disk set are located on Printer Disk 3.

Step 2

In the Control Panel of the Windows Program Manager, double-click the Adobe PostScript Printers icon. The Adobe PostScript Printers dialog box appears.

Step 3

In the Drives box, select the drive containing the PPD that you wish to install.

Step 4

In the Printer Descriptions Available box, select the PPD that you wish to use to install the PostScript printer.

Step 5

Click Install. You can continue to install PPDs by selecting entries in the Printer Descriptions Available box and clicking Install.

Step 6

Click Close when you have installed all the desired PPDs.

CONFIGURING THE POSTSCRIPT PRINTER DRIVER

=====

Step 1

In the Control Panel, double-click the Printers icon. The Printers dialog box appears.

Step 2

Select the name of the printer that you want to configure in the Installed Printers list of printers.

Step 3

To customize the printer driver settings available for your printer, follow the instructions in "Setting printer driver options" in Chapter 7 of the Apple Color LaserWriter 12/600 PS manual.

Step 4

If your printer is not connected to LPT1 or the port currently shown, click Connect.

Step 5

In the Connect dialog box, select the port to which your printer is connected and click OK. For more information on setting up for NetWare networks, see "Setting Up the PostScript printer driver for NetWare" in Chapter 3 of the Apple Color LaserWriter 12/600 PS manual.

DELETING PREVIOUS VERSIONS OF THE DRIVER SOFTWARE

=====

You are not required to remove previous versions of the driver or delete any previously installed PostScript printers. However, if you suspect installation problems, first remove your installed printers from the Printers dialog box in the Windows Control Panel and reinstall them via the Adobe PostScript Printers dialog box, also in the Windows Control Panel.

To delete a previous version of the driver:

1) Exit Windows.

2) From DOS, delete the following files (not all files may actually exist in your configuration from both your WINDOWS and WINDOWS\SYSTEM directories:

*.EBF
*.PPB
*.PPD
.PFM (delete these ONLY if you did not place them here using the ATM control panel or a font installation program) ADOBEPS?.
RUN_ENUM.*
PSINSTDV.EXE
WINDOWN.EXE
PS_ENUM.*
DOWN.DLL
DWN.HLP

3) Restart Windows to use Notepad or another ASCII text editor to delete the following entries from the WIN.INI file in the WINDOWS directory:

```
[<printer_name>,<port>]          <<<Delete this line
PrinterName=<printer_nickname>    <<<Delete this line

[devices]
<printer_name>=ADOBEPS,<port>,...<<<Delete this line

[PrinterPorts]
<printer_name>=ADOBEPS,<port>,15,45,...<<<Delete this line
```

If the device= line in the [windows] section of the Win.INI file refers to AdobePS, delete that line.

INSTALLING THE PRINTER DESCRIPTION ON WINDOWS NT 3.5

=====

Follow the steps below to install the PostScript Printer Description file for these Apple printers:

Apple Color LaserWriter 12/600 PS
Apple LaserWriter 16/600 PS
Apple LaserWriter Select 360
Apple LaserWriter Pro 600
Apple LaserWriter Pro 630

Step 1

Start Windows NT 3.5

Step 2

Insert the Apple Windows Printer Disk 1 into your floppy disk drive.

Step 3

From the Windows Program Manager, choose File/Run.

Step 4

In the Command Line box, type a:\setup (where a: is your floppy diskette drive indicator), and click OK.

Step 5

The Welcome screen appears.

Step 6

Select Custom Install and click Windows NT Printer Software. Make sure the other check boxes are deselected.

Step 7

Click Install. Instructions for installing the Windows NT software appear. Click Continue. The Print Manager appears.

Step 8

Select Create Printer from the Print Manager's Printer menu. The Create Printer dialog box appears.

Step 9

Select Other (at the bottom of the list) in the Driver Combo box.

Step 10

Insert the Apple Windows Printer Disk 3 into your floppy disk drive.

Step 11

Make sure the correct floppy drive is indicated in the Install Driver dialog box

and click OK. A list of printer drivers appears.

Step 12

Select the printer driver that corresponds to your printer and click OK.

Step 13

Follow the instructions on the screen. If you are installing software from the Windows NT 3.5 CD, you may need to type the path for your driver location. The path may be similar to this:

"c:\windows\system32\spool\drivers\w32x86\1\".

Click Continue and OK to complete the installation.

If you are installing Windows NT 3.5 software from floppy disks, you copy the following files (followed by their locations) to the path of your driver location:

PSCRIPTUI.DLL (Disk 13)

PSCRIPT.DLL (Disk 13)

PSCRIPT.HLP (Disk 18)

USING THE APPLE COLOR LASERWRITER 12/600 PS

=====

This section provides additional information on using the Color LaserWriter 12/600 PS printer.

About the Demonstration Page

When the power is turned on, the Color LaserWriter 12/600 PS automatically prints a startup page and a demonstration page. For legal and B5 paper sizes, only the startup page prints; the demonstration page is not printed. You can use the Apple Printer Utility to turn off the printing of the startup and demonstration pages.

About the Apple Color LaserWriter 12/600 PS Status Panel

As described in the Color LaserWriter 12/600 PS manual, Appendix G, the status panel lights aid in indicating hardware service problems found during printer startup. If the Alert light is flashing and all the door lights are flashing, check all the printer doors; one of them is open. If the Paper OUT and Paper Jam lights are flashing alternately, a hardware problem has been detected. To identify the problem, notice which toner lights (C, M, Y, Bk) and how many of the maintenance lights (in the area on the right-hand side of the status panel) are on, and refer to the table below. Each area listed under "Problem" represents a general circuit area for the service technician to investigate, not necessarily the exact cause of the problem.

Begin_Table

Toner	# Consumable	Problem
Lights On	Lights On	

C	0	I/O Controller Boar
C	1	SIMM, Slot J11
C	2	SIMM, Slot J10
M	2	Hard Drive
M	3	I/O Controller ROM
Y	0	Fuser
Y	1	Oil Pump in Fuser
Y	2	Thermal Sensor in Fuser
Y	3	Paper Feed Unit
Bk	0	DC Controller
Bk	1	Power Supply
Bk	2	Toner Carousel
Bk	3	Laser/Sanner Circuit
M & Bk	0	Main Motor
M & Bk	1	Drum Motor
M & Bk	2	Laser/Scanner
C & Bk	0	Controller Fan
C & Bk	1	Fuser Fan
C & Bk	2	Main Fan

End_Table

If you have an external SCSI hard disk drive attached but don't turn it on before you turn on the printer's power, the printer may indicate a hardware failure. To correct the problem, turn the hard disk drive on and restart the printer.

Using NetWare Banner Pages

The Color LaserWriter 12/600 PS is a PostScript printer only. If you are using NetWare 4.x, use PostScript banner pages only. If you use another type of banner page, your print job as well as the banner page will not print. Do not use banner pages at all with NetWare 3.x. If you do, neither the banner page nor your print job will print.

Printing Over Novell Networks

By default, binary PostScript sent via the Novell network is encoded in Tagged Binary Communications Protocol (TBCP). The printer's TBCP filtering mode for Novell is also on by default. If you change the Protocol Options to "None" from the Printer Control Panel's PostScript setup, you must send the following PostScript to turn off TBCP filtering for Novell on the printer:

```
true 0 startjob
(%PrintServer%)
<</Filtering /None>> setdevparams
```

If you subsequently change the Protocol Option back to "Default", you must send the following PostScript to turn on TBCP filtering for Novell on the printer:

```
true 0 startjob
(%PrintServer%)
```

```
<</Filtering /InterpreterBased>>  
setdevparams
```

The Novell filtering mode cannot be changed within a PostScript job, so the above PostScript sets the filtering mode outside the job context; thus it becomes permanent. If your printer's password has been changed from the default setting, replace the "true 0 startjob" line with "true <your password> startjob".

Obtaining the Best Results for Business Graphics

To obtain the best results for business graphics, colors should be 100% saturated. For example, to print pure yellow, define yellow as 100% red and 100% green without any blue. Then print your document, ensuring the Send Full Color Data option on the Job Control tab dialog is selected.

Printing on Legal-Size Paper

In the standard memory configuration, the Color LaserWriter 12/600 PS uses a higher compression technique for legal-sized paper using only the cyan, magenta, and yellow color planes. As a result of this compression technique, very complex pages may show missing pixels in fine lines or small text, "jaggies" (edges with low-resolution appearance) and color changes. To improve the image quality of such pages, you can increase the printer's memory to 16 MB or more. With at least 16 MB of printer memory, the Color LaserWriter 12/600 PS can achieve the same quality with legal-size pages as with letter and A4 sizes using all four color planes (cyan, magenta, yellow, and black.)

Printing Images on the Color LaserWriter 12/600 PS Printer

The Color LaserWriter 12/600 PS printer's highest resolution for printing images is 150 x 150 dpi. No gain in image quality is achieved if higher resolution images are used. All other types of documents print at 600 x 600 dpi.

Avoiding Hue Shifts When Printing to File

When you save an image in an Encapsulated PostScript (EPS) file all the PostScript settings relating to the original output device in effect are saved along with the image data. When the image is printed later, the settings that were in effect may cause major hue shifts. To prevent these hue shifts save the image in TIFF format instead of EPS.

The Density Control Panel

The Color LaserWriter 12/600 PS has been adjusted at the factory to produce the best possible image quality. However, small variations exist among different printers. To make subtle changes to image quality, you can use the Density Control Panel on the back of the printer. NOTE: If changing the settings produces inferior image quality, return to the factory settings by following these steps: Select each color using the Color Select button, then press the - or + button to move the indicator light to the center position. When the indicator is in the center, press Enter to make the setting permanent. Repeat

this procedure for all four colors.

Printer's Processor Speed

In the printer manual, Appendix A contains a typographical error: the microprocessor speed is 30 MHz, not 25 MHz as printed.

Using the Color LaserWriter 12/600 PS with a Windows NT Server

Using a Windows NT Server may cause spurious job records to be entered in the printer's Job Log if the printer is busy. The jobs will have a status of "cancelled".

OBTAINING PRINTER SUPPLIES FOR THE COLOR LASERWRITER 12/600 PS

=====

To order printer supplies for the Color LaserWriter 12/600 PS direct from Apple, call 1-800-600-7805. For order numbers, see Appendix A of the printer manual.

- * toner cartridges
- * transparencies
- * photoconductor cartridge (includes toner disposal boxes)
- * fuser oil
- * fuser

Instructions for replacing the fuser are in Appendix F of the printer manual. Instructions for replacing other printer parts come in the new packages.

For the location of the nearest Apple-authorized dealer, call 1-800-538-9696, extension 525.

APPLE PRINTER UTILITY 2.0

=====

Using the Apple Printer Utility with Other Apple Printers - You can use the Apple Printer Utility for Windows only with the Apple Color LaserWriter 12/600 PS. For other Apple printers use the LaserWriter Utility for Windows that came with the printer.

Using the Apple Printer Utility on the Parallel Port - When you select the Parallel setting for the Apple Printer Utility you will see a delay of about twenty seconds before the printer name appears. You will also see a delay if you configure the Ethernet configuration within Communication Settings via parallel.

Opening Dialogs within the Apple Printer Utility - Use the check boxes to open individual dialogs within the Apple Printer Utility.
